The close of the 12th century saw the final and complete subjection of the ancient Cambro-British Church to the temporal primacy of Canterbury. Wales would naturally have fallen under the primacy of York, but the Welsh sees had continued practically independent of outside control during Saxon times. The bishops of St Davids had from time to time claimed metropolitan rights over the remaining sees, but in 1115 St Anselm's appointment of the monk Bernard (d. 1147) to St Davids, in spite of the opposition of the native clergy, definitely marked the end of former Welsh ecclesiastical independence. In 1188 Archbishop Baldwin of an distinguished train, whilst preaching the Third Crusade, made an itinerary of the Welsh sees and visited the four cathedral churches, thereby formally asserting the supremacy of Canterbury throughout all Wales. But in 1199 the celebrated Gerald de Barri (Giraldus Cambrensis), archdeacon of Brecon and a member of the famous Norman baronial house of de Barri, and also through his grandmother Nesta a great-grandson of Prince Rhys ap Tudor of Deheubarth, was elected bishop by the chapter of St Davids. This enthusiastic priest at once began to re-assert the ancient metropolitan claims of the historic Welsh see, and between the years 1199-1203 paid three visits to Rome in order to obtain the approval of the Pope. But Gerald was treated with scorn by Archbishop Hubert, who firmly refused to recognize Gerald's late election. Innocent was inclined to temporize, whilst the Welsh chieftains, and especially Gw Gwenwynwyn of Powys, loudly applauded Gerald's action, but Llewelyn ap Iorwerth himself prudently held aloof from the controversy. Finally, in 1203, Gerald was compelled to make complete submission to the king and archbishop at Westminster, and henceforth Canterbury remained in undisputed possession of the Welsh sees, a circumstance that undoubtedly tended towards the later union of the two countries.

In 1238 Llewelyn, growing aged and infirm, summoned all his vassals to a conference at the famous Cistercian abbey of Strata Florida, whereat David, his son by the Princess Joan of England, was acknowledged his heir by all present. Two years later Llewelyn, the ablest and most successful of all the Welsh princes, expired and was buried in the monastery of his own foundation at Aberconway. He was succeeded by David II., at whose death without children in 1240 the sovereignty of Gwynedd, and consequently of Wales, reverted to his three nephews, sons of his half-brother Griffith, who had perished in 1211 against John, and amongst them, Hubert, who firmly refused to recognize Gerald's late election. Innocent was inclined to temporize, whilst the Welsh chieftains, and especially Gw Gwenwynwyn of Powys, loudly applauded Gerald's action, but Llewelyn ap Iorwerth himself prudently held aloof from the controversy. WALES

to remain in force amongst the natives of all Wales, whilst it was henceforth arranged to administer justice in the eight counties by special royal judges, and in the Marches by the officers appointed by the various lords-marchers according to the terms of their tenure. Another distinguishing mark of Edward's policy towards Wales is to be found in the commercial and administrative powers given to the fortified towns, inhabited solely by people of English birth and by Welshmen who acquired 12 English rule. Municipal charters and market privileges were now granted to such towns as Cardiff, Carmarthen, Builth, Cardigan, Montgomery, Aberystwith, Newborough, &c., and this wise policy was continued under Edward II. and Edward III. Many of the turbulent Welsh warriors having now become mercenaries on the continent or else enlisted under the English king, and the whole of the land west of Severn at last enjoying internal peace, the commercial resources of Wales were developed in a manner that had hitherto not been possible. Coal, copper, timber, iron, and especially wool, were exported from the Principality, and by the Statute Staple of 1353 Carmarthen was declared the sole staple for the whole Welsh wool trade, every bale of wool having first to be sealed or ‘cocketed’ at this important town, which during the 14th century may almost be accounted as the English capital of the Principality, so greatly was it favoured by the Plantagenet monarchs. A natural result of this partial treatment of the towns by the king and his vassals was that the English tongue and also English customs became prevalent if not universal in all the towns of Wales, whilst the rural districts remained strongly Cymric in character, language and sympathy.

After more than a century of enforced repose in the land and of prosperity in the towns, all Wales was suddenly convulsed by a wide-spread revolt against the English crown, which reads more like a tale of romance than a piece of sane history. The deposition of Richard II. and the usurpation of Henry IV., combined with the jealousy of the rural inhabitants of Wales against the privileged dwellers of the towns, seem to have rendered the country ripe for rebellion. Upon this troubled scene now appeared Owen Glendower (Owain Glyndwr) died? 1413), a descendant of the former princes of Powys and a favourite courtier of the late King Richard, smiting under the effect of personal wrongs received from Henry of Lancaster. With a speed and skill that contemporary writers deemed miraculous, Owen stirred up his countrymen against the king, and by their aid succeeded in destroying castle after castle, and burning town after town throughout the whole length and breadth of the land between the years 1401 and 1406. In 1402 he routed the forces of the Mortimers at Bryn Glas near Knighton in Herefordshire, where he captured Sir Edmund Mortimer, the uncle and guardian of the legal heir to the English throne, the young earl of March. The aims of Owen were described by himself in a letter addressed to Charles VI., king of France, who had hastened to acknowledge the upstart as Prince of Wales and had sent 12,000 troops on his behalf to Milford Haven. In this letter Owen, who was holding his court in Llanbadarn near Aberystwith, demands his own acknowledgment as sovereign of Wales; the calling of a free Welsh parliament on the English model; the independence of the Welsh Church from the control of Canterbury; and the founding of national colleges in Wales itself. An assembly of Welsh lords-marchers was summoned to meet at Llanelly in an ancient building still standing and known to this day as “Owen Glendower’s Parliament House.” In vain did Henry and his lords-marchers endeavour to suppress the rebellion, and to capture, by fair means or foul, the person of Glendower himself; the princes adventurer seemed to bear a charmed existence, and for a few years Owen was practically master of all Wales. Nevertheless, his rule and power gradually declined, and by the year 1408 Owen himself had disappeared as suddenly and mysteriously as he had arisen, and the land once more fell into undisputed possession of the king and his chosen vassals. For Owen's brilliant but brief career and ruthless treatment of English settlers and Anglophile Welshmen, his countrymen had not unnaturally to pay a heavy penalty in the severe statutes which the afflicted parliaments of Henry IV. framed for the protection of the English dwellers in Wales and the border counties, and which were not repealed until the days of the Tudors. Of the part played by the Cymry during the wars of the Roses it is needless to speak, since the period forms a part of English rather than of Welsh history. The Yorkist faction seems to have been strongest in the eastern portion of the Principality, where the Mortimers were all-powerful, but later the close connexion of the house of Lancaster with Owen Tudor, a gentleman of Anglesea (beheaded in 1461) who had married Catherine of France, widow of Henry V., did much to invoke Welsh sympathy on behalf of the claims of Henry Tudor his grandson, who claimed the English throne by right of his grandmother. Through the instrumentality of the celebrated Sir Rhys ap Thomas (1451-1527), the wealthiest and the most powerful personage in South Wales, Henry Tudor, earl of Richmond, on his landing at Milford Haven in 1485 found the Welsh ready to rise in his behalf against the usurper Richard III. With an army largely composed of Sir Rhys's adherents, Henry was enabled to face Richard III. at Bosworth, and consequently to obtain the crown of England. Thus did a Welshman revenge the ignominious deaths of Prince Llewelyn and Prince David by becoming two centuries later king of England and prince of Wales.

With the Tudor dynasty firmly seated on the throne, a number of constitutional changes intended to place Welsh subjects on a complete social and political equality with Englishmen have to be recorded. The all-important Act of Union 1536 (27 Henry VIII.), converted the whole of the Marches of Wales into shires, and created five new counties: Denbigh, Montgomery, Radnor, Brecknock, or Brecon and Monmouth. At the same time the remaining lordships were added to the English border counties of Gloucester, Shropshire and Hereford, and also to the existing Welsh shires of Cardigan, Carmarthen, Glamorgan and Pembroke, all of which found their boundaries considerably enlarged under this statute. Clause 26 of the same act likewise enacted that the 12 Welsh counties should return 24 members to the English parliament: one for each county, one for the boroughs in each county (except Merioneth), and one for the town and county of Haverfordwest. It is probable that Welsh members attended the parliaments of 1536 and 1539, and certain it is that they were present at the parliament of 1541 and every parliament subsequently held. This act of union was followed in 1542 by an Act for certain Ordinances in the King's Majesty's Dominions and Principality of Wales (34 & 35 Henry VIII.), which placed the court of the president and council of Wales and the Marches on a legal footing. This court, with a jurisdiction somewhat similar to that of the Star Chamber, had originally been created in 1466 for the suppression of the Plague and the private feuds and other illegality amongst the lords-marchers and their retainers. This council of Wales, the headquarters of which had been fixed at Ludlow, undoubtedly did good service on behalf of law and order under such capable presidents as Bishop Rowland Lee and William Herbert, earl of Pembroke; but it had long ceased to be of any practical use, and had in fact become an engine of oppression by the time of the Commonwealth, although it was not definitively abolished till the revolution of 1688. The Act of 1542 also enacted that courts of justice under the name of "The King's Great Sessions in Wales" should sit twice a year in every one of the counties of Wales, except Monmouth, which was thus formally declared an English shire. For this purpose four circuits, two for North and two for South Wales, each circuit containing a convenient group of three counties, were created; whilst justices of the peace and custodes rotulorum for each shire were likewise appointed. At the same time all ancient Welsh laws and customs, which were at variance with the recognized law of England, were now declared illegal, and Cymric land tenure by gavelkind, which had been respected by Edward I., was expressly abolished and its place taken by the ordinary practice of primogeniture. It was also particularly stated that all legal procedure must henceforth be conducted in the English tongue, an arrangement which fell very heavily on poor monoglot Welshmen and appears an especially harsh and
ungracious enactment when coming from a sovereign who was himself a genuine Welshman by birth. Under the system of the Great Sessions Justice was administered throughout the twelve counties of Wales for nearly three hundred years, and it was not until 1830 that this system of jurisdiction was abolished (not without some protest from Welsh members at Westminster), and the existing North and South Wales circuits were brought into being.

With the peaceful absorption of the Principality into the realm of the Tudor sovereigns, the subsequent course of Welsh history assumes mainly a religious and educational character. The influence of the Renaissance seems to have been tardy in penetrating into Wales itself, nor did the numerous ecclesiastical changes during the period of the Reformation cause any marked signs either of resentment or approval amongst the mass of the Welsh people, although some of the ancient Catholic customs lingered on obstinately. As early as the reign of Henry VIII there were, however, to be found at court and in the universities a number of ardent and talented young Welshmen, adherents mostly of the reforming party in Church and State, who were destined to bring about a brilliant literary revival in their native land during the reigns of Elizabeth and James I. Of this distinguished band the most memorable names are those of Bishop Richard Davies (c. 1501-1538) and of William Salesbury, the squire-scholar of Llanwrst (c. 1520-c. 1600) in Denbighshire, who is commonly credited with the honour of having produced the first Welsh printed book. The small volume, consisting of a few verses published in London about the year 1545. With the accession of Elizabeth a novel and vigorous ecclesiastical policy on truly national lines was now inaugurated in Wales itself, chiefly through the instrumentality of Richard Davies, nominated bishop of St Asaph in 1559 and translated thence to St Davids in 1561, who was mainly responsible for the act of parliament of 1563, commanding the bishops of St Davids, Llandaff, Bangor, St Asaph and Hereford to prepare with all speed for public use Welsh translations of the Scriptures and the Book of Common Prayer. Of the five prelates thus named, Davies alone was competent to undertake the task. As a translator his work of translation he called upon his old friend and former neighbour, William Salesbury, who like the bishop was an excellent Greek and Hebrew scholar. The pair laboured with such diligence that before the close of the year 1567 the required translations of the Liturgy and the New Testament were published in London; the former being the exclusive work of the bishop, whilst the latter was principally the product of Salesbury's pen, although some portions of it were contributed by Bishop Davies and by Thomas Huett, or Hewett, precentor of St Davids (d. 1591). Having established a lexicographical standard, a volume is time, the two friends were next engaged upon a translation of the Old Testament, but owing to a quarrel, the cause of which remains obscure, this interesting literary partnership was brought to an abrupt ending about 1570. The honour of presenting his countrymen with a complete Welsh version of the Bible was reserved for William Morgan (c. 1547-1604), vicar of Llanrhaiadr, in Denbighshire, and afterwards bishop successively of Llandaff and of St Asaph. For eight years Morgan was busied with his self-imposed task, being greatly encouraged thereto by the Bishop of Hereford, Bishop William Hughes (d. 1600) of St Asaph, and by other leading dignitaries of the Church both in England and in Wales. In December 1588 the first complete Welsh Bible, commonly known as "Bishop Morgan's Bible," was issued from the royal press at Westminster under the patronage of queen and primate, about 800 copies being supplied for distribution amongst the parish churches of Wales. This famous editio princeps of the Welsh Bible, first and foremost of Welsh classics, was further supplemented under James I. by the Authorized Version, produced by Richard Parry (1560-1623), bishop of St Asaph, with the help of Dr John Davies of Mawlyd (1570-1644), the first of the Welsh scholars who sprang from the name of "Bishop Morgan's Bible" in 1888 a national movement of appreciation was set on foot amongst Welshmen of all denominations both at home and abroad, with the result that a memorial cross was erected in the cathedral close of St Asaph in order to perpetuate the names and national services of the eight leading Welsh translators of the Scriptures—Bishops Davies, Morgan and Parry; William Salesbury; Thomas Huett; Dr Davies of Mawlyd; Archdeacon Edmund Frys (1541-1624), author of a popular Welsh metrical version of the Psalter; and Gabriel Goodman, dean of Westminster (1528-1601), a native of Ruthin, who greatly assisted Bishop Morgan in his task. Two circumstances attending the production of these Welsh translations should be noted:—(1) That the leaders of this remarkable religious, literary and educational revival within the Principality were chiefly natives of North Wales, where for many years St Asaph was regarded as the chief centre of Cambro-British intellectual life; and (2) that all these important works in the Welsh tongue were published of necessity in London, owing to the absence of an acknowledged capital, or any central city of importance in Wales itself.

It would be well-nigh impossible to exaggerate the services rendered to the ancient British tongue, and consequently to the national spirit of Wales, by these Elizabethan and Jacobean translations, issued in 1567, 1588 and 1620, which were able definitely to fix the standard of classical Welsh, and to embody the contending dialects of Gwynedd, Dyfed and Gwent for all time in one literary storehouse. But for this sudden revival of Cymric literature under the patronage of Elizabeth (for the obtaining of which Wales must ever owe a deep debt of gratitude to Bishop Richard Davies, "her second St David"), there is little danger of the national identity of the Principality being lost, for the literary language would either have drifted into a number of corrupt dialects, as it then showed symptoms of dying, or else have tended to ultimate extinction, much as the Cornish tongue perished in the 17th century.

The growth of Puritanism in Wales was neither strong nor speedy, although the year 1588, which witnessed the appearance of Bishop Morgan's Bible, also gave birth to two fierce appeals to the parliament, urging a drastic Puritanical policy in Wales, from the pen of the celebrated John Penry, a native of Bontnewydd, Flint (1560-1620). More far-reaching than Penry amongst the Welsh were Rhys Prichard (? 1559-1644), the famous vicar of Llandovery,1 Carmarthenshire, and William Wroth (d. 1642), rector of Llanfaches, Monmouthshire. Of these two Puritan divines, Vicar Prichard, who was essentially orthodox in his behaviour, forms an interesting connecting link between the learned Elizabethan translators of the Bible and the great revivalists of the 17th century, and his moral rhymes in the vernacular, collected and printed after his death under the title of The Welshman's Candle (Canwyll y Cymry), still retain some degree of popularity amongst his countrymen. Although a strong opponent of Laud's and Charles's ecclesiastical policy, Prichard lived unmolested, and even rose to be chancellor of St Davids; but the indiscreet Wroth, "the founder and father of nonconformity in Wales," being suspended in 1638 by Bishop Murray of Llandaff, founded a small community of Independents at Llanfaches, which is thus commonly accounted the first Nonconformist chapel in Wales. During the years prior to the Great Rebellion, however, in spite of the preaching and writings of Vicar Prichard, Wroth and others, the vast mass of Welshmen of all classes remained friendly to the High Church policy of Laud and staunch supporters of the king's prerogative. Nor were the effects of the great literary revival in Elizabeth's reign by any means exhausted, for at this time Wales undoubtedly possessed a large number of native divines that were at once active parish priests and excellent scholars, of whom many had been educated at Jesus College, Oxford, the Welsh college endowed by Dr Hugh Price (d. 1574) and founded under Elizabeth's patronage in 1572. So striking was the devotion shown throughout the Principality to the king, who fought his last disastrous campaign in the friendly counties of Wales and the Marches, that on the final victory of the parliament there was passed within a month of Charles's execution 1Sometimes known as vicar of Llandinata, his church being in that parish.
in 1649 (perhaps as a special measure of punishment) an “Act for the better Propagation and Preaching of the Gospel in Wales,” by the terms of which a packed body of seventy commissioners was presented with powers that were practically unlimited to deal with all matters ecclesiastical in Wales. To assist these commissioners in their task of inquiry and ejectment, a body of twenty-five “Approvers” was likewise constituted, with the object of selecting itinerant preachers to replace the dismissed incumbents; and amongst the Approvers are conspicuous the names of Walter Craddock (d. 1659), a suspended curate of St Mary’s, Cardiff, and a follower of Wroth’s; and of Vavasor Powell (1617-1670), an honest but injudicious zealot. Some 330 out of a possible total of 520 incumbents were now ejected in South Wales and Monmouthshire, and there is every reason to suppose that the beneficed clergy of North Wales suffered equally under the new system. The greed and tyranny of several of the commissioners, and the bigotry and mismanagement of well-meaning fanatics such as Craddock and Powell, soon wrought dire confusion throughout the whole Principality, so that a monster petition, signed alike by moderate Puritans and by High Churchmen, was prepared for presentation to parliament in 1652 by Colonel Edward Freeman, attorney-general for South Wales. Despite the fierce efforts of Vavasor Powell and his brother itinerant preachers to thwart the reception of this South Wales petition at Westminster, Colonel Freeman was able to urge the claims of the petitioners, or “Anti-Propagators” as they were termed, at the bar of the House, thereby setting a precedent for the vast future activity by the House of Commons in the matter of ejectment and destruction “the light of the Gospel was almost extinguished in Wales.” A new commission was now appointed to inquire into alleged abuses in Wales, and the existing evidence clearly shows how harsh and unfair was the treatment meted out to the clergy under the act of 1649, and also how utterly submissive of all ancient custom and established order were the reforms suggested by the commissioners and approvers. At the Restoration all the ejected clergy who survived were reinstated in their old benefices under the Act of Uniformity of 1662, whilst certain Puritan incumbents were in their turn dismissed for refusing to comply with various requirements of that act. Amongst these Stephen Hughes of Carmarthen (1623-1668), a devoted follower of Vicar Prichard and an editor of his works, was ejected from the living of Mydrim in Carmarthenshire, whereby the valuable services of this eminent divine were lost to the Church and gained by the Nonconformists, who had increased considerably in numbers since the Civil Wars. The old ecclesiastical policy of Elizabeth, which had hitherto borne such good fruit in Wales, was now gradually relaxed under the later Stuarts and definitely abandoned under Anne, during whose reign only Englishmen were appointed to the vacant Welsh sees. From 1702 to 1780, a period of nearly 170 years, no Welsh-speaking native bishop was nominated (with the solitary exception of John Wynne, consecrated to St Asaph in 1715), and it is needless to point out that this selfish and unjust policy was largely responsible for the neglect and misrule which distinguished the latter half of the 18th and the early part of the 19th centuries. The Church, which had so long played a prominent and valuable part in the moral and literary education of the Welsh people, was now gradually forced out of touch with the nation through the action of alien and unsympathetic Whig prelates in Wales itself, which still remained mainly High Church and Jacobite in feeling. All writers agree in stating that the mass of the Welsh people at the close of the 17th century were illiterate, and many divines of Cymric nationality charge their countrymen also with immoralty and religious apathy. English was little spoken or understood amongst the peasant population, and there was a great dearth of Welsh educational works. Some efforts to remedy this dark condition of things had already been made by Thomas Gouge, with the assistance of Stephen Hughes, and also by the newly founded “Society for the Promotion of Christian Knowledge”; but it was Griffith Jones (1683-1761), rector of Llanddowror in south Carmarthenshire, who was destined to become the true pioneer of Welsh education, religious and secular. Early in the reign of George I this excellent man, whose name and memory will ever be treasured so long as the Welsh tongue survives, began a system of catechizing in the vernacular amongst the children and adults of his own parish. With the cordial help of Sir John Phillips (d. 1736) of Picton Castle, the head of an ancient family in Dyfed, and of Mrs Bridget Bevan of Laugharne (d. 1759), who is still affectionately remembered in Wales as the donor of “Madam Bevan’s Charity,” Griffith Jones was enabled to extend his scheme of educating the people throughout South Wales, where numerous “circulating charity schools,” as they were called, were set up in many parishes with the approval of their incumbents. The results obtained by the growth of these schools were speedy and successful beyond the wildest hopes of their founder. This educational system, invented by Griffith Jones and supported by the purse of Mrs Bevan, in 1760 numbered 215 schools, with a total number of 8007 contemporary scholars; and by the date of Jones’s death in 1761 it has been proved that over 150,000 Welsh persons of every age and of either sex, nearly a third of the whole population of Wales at that time, were taught to read the Scriptures in their own tongue by means of these schools. With this newly acquired ability to read the Bible in their own tongue, the many persons so taught were not slow to express a general demand for Cymric literature, which was met by a supply from local presses in the small country towns; the marvellous success of the Welsh circulating schools caused in fact the birth of the Welsh language press. The Bible and sermons were issued gratuitously in the conditions and the behaviour of the Welsh people, owing to this strictly orthodox revival within the pale of the Church, Griffith Jones and his system of education were regarded with indifference by the English prelates in Wales, who offered no preference and gave little encouragement to the founder of the circulating schools. Meanwhile the writings and personal example of the pious rector of Llanddowror were stirring other Welshmen in the work of revival, chief amongst them being Howell Harris of Trevecca (1713-1773), a layman of brilliant abilities but erratic temperament; and Daniel Rowland (1715-1759), curate of Llangatho in Mid Cardiganshire, who became in time the most eloquent and popular preacher throughout all Wales. Two other clergymen, who figure prominently in the Methodist movement, and whose influence has proved lasting, were Peter Williams of Carmarthen (1722-1790), the Welsh Bible commentator, and William Williams of Pantycelyn (1727-1791), the celebrated Welsh hymn-writer. Incidentally, it will be noticed that this important Methodist revival had its origin and found its chief supporters and exponents in a restricted corner of South Wales, of which Carmarthen was the centre, in curious contrast with the literary movement in Elizabeth’s reign, which was largely confined to the district round St Asaph. During the lifetime of Griffith Jones the course of Welsh Methodism had run in orthodox channels and had been generally supported by the Welsh clergy and gentry; but after his death the tendency to exceed the bounds of conventional Church discipline grew so marked as to excite the alarm of the English bishops in Wales. Nevertheless, the bulk of the Methodists continued to attend the services of the Church, and to receive the sacraments from regularly ordained parish priests, although a schism was becoming inevitable. Towards the close of the 18th century the Methodist revival spread to North Wales under the influence of the celebrated Thomas Charles, commonly called Charles of Bala (1755-1814), formerly curate of Llanymddy and the founder of Welsh Sunday schools. So strained had the relations between the English rulers of the Church and the Methodists themselves now grown, that in 1811 the long-expected schism took place, much to the regret of Charles of Bala himself, who had ever been a devoted disciple of Griffith Jones. The great bulk of the farming and labouring members of the Church now definitely abandoned their “Ancient Mother,” to whom, however, the Welsh gentry still adhered. The Great Schism of 1811 marks in fact the lowest point to which the
fortunes of the once powerful and popular Church in Wales had sunk;—in 1811 there were only English-speaking prelates to be found, whilst the absence of non-residence, pluralities and every sort of corruption then prevailing in Wales, mention may be made of the cases of Richard Watson (d. 1816), the non-resident bishop of Llandaff, who rarely visited his diocese during an episcopate of thirty years; and of another English divine who held the deanery, the chancellorship and nine livings in a North Welsh see, his curates-in-charge being paid out of Queen Anne's Bounty, a fund expressly intended for the benefit of impoverished livings.

An honourable exception to the indolent and rapacious divines of this stamp was Thomas Burgess (bishop of St Davids), the创建工作sion is mainly due the foundation of St David's College at Lampeter in 1822, an institution erected to provide a better and cheaper education for intending Welsh clergymen. The foundation of Lampeter College was one of the earliest signs of a new era of revived vigour and better government within the Church, although it was not till 1870 that, by Mr Gladstone's appointment of Dr Joshua Hughes to the see of St Asaph, the special claims of the Welsh Church were officially recognized, and the old Elizabethan policy was one more reverted to after a lapse of nearly two hundred years. After 1870 Welsh ecclesiastical guidance was at last made in a more true sense of the word, and this official acknowledgment of the peculiar duties and claims of the Church in Wales largely helped to win back no small amount of the strength and popularity that had been lost during Georgian times.

With the old national Church enthralled by English political prelates, and consequently hindered from ministering to the special needs of the people, the progress of dissent throughout the Principality was naturally rapid. Although primary education was largely supplied by the many Church schools in all parts of Wales, yet it was in the three most important denominations—Baptists, the Calvinistic Methodists (that new-born sect of which the Church herself was the unwilling parent)—that almost all Welsh spiritual development was to be found during the first half of the 19th century. Thus between the year 1811 (the date of the Methodist secession) and 1832 (the year of the great Reform Bill), the number of dissenting chapels had risen from 945 to 1428: a truly marvellous increase even allowing for the speedy growth of population, since every chapel so built had of necessity to be well attended in order to render it self-supporting. From this religious awakening of the Welsh people, the change wrought in the Principality, and the effects of the national spirit, it was but a step to political ascendency, and as the various constitutional changes from the Reform Bill onward began to lower the elective franchise, and thus to throw more and more power into the hands of the working classes, that spirit of radicalism, which is peculiarly associated with political dissent, began to assert itself powerfully throughout the country. As early as the reign of William IV. there appeared the weekly Times of Wales (Amserau Cymry), founded and edited by the able William Rees, who may be styled the father of the Welsh political press; and the success of Rees's venture was so marked that other journals, arranged to suit the special tenets of each sect, speedily sprang into existence. In the year 1872—a date for many reasons marks the opening of an important era in modern Welsh history—the dissenting bodies of Wales were supporting two quarterly, sixteen monthly and ten weekly papers, all published in the vernacular and all read largely by peasants, colliers and artisans. With so powerful a press behind it, it is no wonder that Welsh political dissent was largely responsible for the changed attitude of the Imperial government in its treatment of the Principality. As the result of the National School Closing Act of 1833, a measure which was very dear to the strong temperance party in Wales, and in the Welsh Intermediate Education Act, granted by Lord Salisbury's government in 1889. It was certainly owing to the pressure of Welsh political dissent that Lord Rosebery's cabinet issued the Welsh Land Tenure Commission in 1893—an inquiry which did much to exonerate the Welsh squirearchy from a number of vague charges of extortion and sectarian oppression; and that Sir H. Campbell-Bannerman's cabinet appointed the Welsh Church Commission (21st June 1906). This Commission was uniquely suited to 'recommend to the Established Church, amount and application of the temporalities, endowments and other properties of the Church of England in Wales and Monmouthshire; and into the provision made and the work done by the Churches of all denominations in Wales and Monmouthshire for the spiritual welfare of the people, and the extent to which the people avail themselves of such provision.' The Report and Memoranda of the Commission were published on the 2nd of December 1910.

Attention must be made of the Rebecca riots in 1837-1844 in South Wales, whereby many toll gates were destroyed by mobs of countrymen dressed in female garb, "as the daughters of Rebecca about to possess the gates of their enemies"; and the Anti-Tithe agitation of 1853-1856—largely traceable to the inflammatory language used concerning clerical tithe by certain organs of the vernacular press—which led to some disorderly scenes between dispiriting parties of police and crowds of excited peasants in the more remote rural districts. There have been occasional strikes accompanied by acts of lawlessness in the industrial and mining districts of Glamorgan, and also among the members of the dissenting religious denominations, which has been occasioned by the desire of the numbers thus induced to the Calvinistic Methodists to change their salvation, and purged to the Independents of the views of the separate religious denominations.

The University College of Wales was founded at Aberystwyth in 1872; that of South Wales at Cardiff in 1883; and of North Wales at Bangor in 1884. In 1889 the system of intermediate schools, arranged to form an educational link between the primary schools and the colleges, was inaugurated. In November 1893 the University of Wales was incorporated by royal charter, with Lord Aberdare (d. 1897) as its first chancellor. All the religious bodies, including the Church, have been extremely active in educational and pastoral work; whilst the peculiar religious movement known as a revival (Diwygiad) has occurred from time to time throughout the Principality, notably in the years 1859 and 1904.

But the most remarkable phenomenon in modern Wales has been the evident growth of a strong national sentiment, the evolution of a new Welsh Renaissance, which demanded special recognition of the Principality's claims by the Imperial parliament. This revived spirit of nationalism was by outsiders sometimes associated, quite erroneously, with the aims and actions of the Welsh parliamentary party, the spokesmen of political dissent in Wales; yet in reality this sentiment was shared equally by both Anglican and Nonconformist, and was a distinguishing mark of the laity within its fold. Nor is the question of the vernacular itself of necessity bound up with this new movement, for Wales is essentially a bi-lingual country, wherein every educated Cymro speaks and writes English with ease, and where also large towns and whole districts—such as Cardiff, south Monmouth, the Vale of Glamorgan, Gower, south Glamorgan, south Pembroke, east Flint, Radnorshire and Breconshire—remain practically monoglot English-speaking. Nor are the Welsh landowners and gentry devoid of this new spirit of nationalism, and although some generations ago they ceased as a body to speak the native tongue, they have shown a strong disposition to study once more the ancient language and literature of their country. It is true that a Young Wales party has arisen, which seeks to narrow this movement to the exclusion of English ideas and influences; and it is also true that there is a party which is abnormally suspicious of and hostile to this Welsh Renaissance; but in the main it is correct to say that the bulk of the Welsh nation remains content to assert its views and requirements in a reasonable manner. How wide-spread and enthusiastic is this true spirit of nationalism amongst the Welsh people, may be observed at the great meetings of the National Eisteddfod, which is held on alternate years in North and South Wales at some important centre, and at which the immense crowds collected and the interest displayed make a deep impression on the Anglo-Saxon or foreign visitors. The sincere, if somewhat narrow-minded religious feelings; the devotion manifested by all classes towards the land of their fathers; the extraordinary
vitality of the Cambro-British tongue—these are the main characteristics of modern Wales, and they seem to verify the terms of Taliesin's ancient prophecy concerning the early dwellers of Gwalia:

"Their Lord they shall praise;
Their Tongue they shall keep;
Their Land they shall lose
Except Wild Wales."

(H. M. V.)

Welsh Literature.—The Welsh language possesses an extensive literature, ranging from the 9th century to the present day. A detailed account of it will be found in the article Celt: Celtic Literature, § iv.

Welsh Language.—Welsh, the Celtic language spoken by the ancient Britons (see Celt: Language), is the domestic tongue of the majority of the inhabitants of the Principality. With the final destruction of Welsh independence under Edward I., the Cambro-British language, in spite of the disappearance of a court, continued to be spoken by Welshmen of all classes residing west of Severn, and the 14th and 15th centuries are remarkable for producing some of the finest Welsh bards and historians. With the union of Wales with England by the Act of 27 Henry VIII. (1536) the subsequent administration of all law and justice in the English tongue throughout the Principality threatened for a time the ancient language of the people with practical extinction. Even so far as it was represented in the various translations of the Scriptures, undertaken at the command of Queen Elizabeth and performed by a number of native scholars and divines, amongst whom appear prominent the names of Bishops Davies, Morgan and Parry, and of William Salesbury of Llanrwt. Although the assertion of the celebrated Rhys Prichard of Llandovery that in his time (c. 1630) only 1% of the people of Wales could read the native language is probably an exaggeration, yet the number of persons who could read and write Welsh must have been extremely small outside the ranks of the clergy during the earlier years of the 17th century. The number of Welsh Bibles distributed throughout the Principality could hardly have exceeded 8000 in all, and except the Bible there was scarcely any Welsh work of importance in circulation. The system of the Welsh circulating charity schools, set up by Griffith Jones, rector of Llanddowror, in the 18th century, undoubtedly gave an immense impetus to the spread of popular education in Wales, for it has been stated on good authority that about one-third of the total population was taught to read and write Welsh by means of this system. As a result of Griffith Jones's efforts there quickly arose a vigorous demand for Welsh books of a pious and educational character, which was largely supplied by local Welsh printing-presses. The enthusiastic course of the Methodist movement under Howell Harris, Daniel Rowland and William Williams; the establishment of Welsh Sunday Schools; the founding of the Bible Society under Thomas Charles of Bala; and the revival early in the 19th century of the Eisteddfodau (the ancient bardic contests of music, poetry and learning), have all contributed to extend the use of the Welsh language and to strengthen its hold as a popular medium of education throughout the Principality. In 1845, the Welsh-speaking population was computed at 67% of the total, and in 1893 Welsh was understood or spoken by over 60% of the inhabitants in the twelve Welsh counties with the exception of the following districts, wherein English is the prevailing or the sole language employed:—viz. nearly the whole of Radnorshire; east Flint, including the neighbouring districts of Ruabon and Wrexham in Denbighshire; east Brecknock; east Montgomery; south Pembroke, with the adjoining district of Laugharne in Carmarthenshire; and the districts of Gower, Vale of Glamorgan and Cardiff in south Glamorgan. In the north, the eastern portion of the county is purely English-speaking, and in the western districts English also prevails (J. E. Southall, Linguistic Map of Wales).

Before tracing the history of Welsh sounds, it will be convenient to give the values of the letters in the modern alphabet:—

Voicesspirants: ff or ph (=Eng. f); th (=Eng. th in thick); ch (=Scottish ch in loch).
Voicedpirants: f (=Eng. v); dd (=Eng. th in this); the guttural voicedpirant (.qual) disappeared early in Welsh.
Voicessnasals: m; mh; n; nh.
Voicednasals: n; m; ng.
Voicesspirants: l; l (unilateral voiceless l); rh (voiceless r).
Voiced liquids: l; r.

Sibilant: s (Welsh has no s).
Aspirate: h.
Semi-vowels: i (=Eng. y in yard); w (=Eng. w).
The sounds of l and d are more dental than in English, though they vary; the voicedpirants are very soft; the voicessnasals are aspirated, thus mh is similar to Eng. nh in inhale; r is trilled as in Italian.

Voels: a, e, i, o have the same values as in Italian; w as a vowel north Eng. oo in book or Italian. u; y has two sounds:—

(1) the clear sound resembling the Eng. i in bit, but pronounced farther back; (2) the obscure sound =Eng. i in sir; u in Med. Welsh had the sound of French u, but now has the clear sound of y described above, which is similar to the ear, and has the same pitch.

The Welsh language belongs to the Celtic branch of the Aryan or Indo-European family of languages. Primitive Celtic split up, as already shown, into the two groups, Celtiberian and Brittonic, the latter giving rise to the Modern Welsh, Cornish and Breton. The languages of these groups are thus represented in two epochs by two languages of languages—(1) the Goidelic group, comprising Irish, Scottish, Gaelic and Manx. (2) The Brythonic or Brittonic group, comprising Welsh, Breton and Cornish. In the Goidelic group, the ancient language, is represented in a more or less pure state by Irish, with which it was supplanted in France by Latin, and by the Celtiberian group, which was transformed into two languages, p., as in Welsh pedwar, "four,” Gaulish, which was supplanted in France by Latin, had p., as in pœris-rimum, "fourth ear,” and is the alliance of the Celtic group; but it is believed that remains of a continental Celtic group exist in such names as Seguanoi, and in some recently discovered inscriptions. The sounds of parent Aryan appeared in Primitive Celtic with the following modifications:—p. disappeared, thus Aryan *peter, which gave Latin poier, Eng. father, gave in Irish athair; corresponding to Eng. floor, we have Irish iðr, Welsh llawr. The velar tenuis g, when labialized, became gu, without labialization became k; the velar media g became b or g. The aspirated melæa dh, dh, gh were treated as unaspirated b, d, g; generally all the rare aspirated tenses fell together with the unaspirated. The other Aryan consonants seem generally to have remained. Aryan d, l, ĭ remained. Aryan ĭ became f, as in Irish 'frr, Welsh gwyf, "true," cognate with Latin tivr-us. Aryan ĭ became ã, as in Irish ird, cognate with Anglo-Saxon er, Eng. floor. The short vowels remained, except that Aryan o became a, as in the other European branches.

In Brythonic, primitive Celtic gu became p, as above noted. Probably also Celtic & was advancing or had advanced to a forward position, or it appears as it is, since, from Celtic *dän-on, cognate with Eng.awan, while Latin dànum in the Brythonic period, gives u with its Welsh sound above described, as in mûr, "wall," from Latin mur-us.

The system of consonants preserved in Celtic, as may be seen in Stokes's restoration of Celtic declension (Trans. Philol. Soc., 1885-1886, pp. 97-203); and Brythonic was probably as highly inflected as Latin. The development of Brythonic into Welsh is analogous to that of Latin into Romance; the extant remains of Brythonic are scanty; but in the Roman period it borrowed a large number of Latin words, which, as we know their original forms, and as they underwent the same modifications as other words in the language, enable us to trace the phonetic changes by which Brythonic became Welsh.

These changes are briefly as follows:

1. Loss of Syllabification. Each syllable was syllabically divided into one syllable only; thus Latin termus-us in Welsh terfyn; the name Sabrina- had become Hafren. The loss extended to the stem-end of the first element in compounds: the personal name Maglo-chan became Madog; and generally to unaccented syllables, thus episcopus became episcop, whence esgob; trinitas-em gives trindd, the accusative is often the case in Welsh, thus: the plural of word has sometimes both, as in cîndd from cîndd-as, and cînndd from cîndd-em, now two words, not two cases of the same word. Aryan declension naturally disappeared with the loss of final syllables.

2. Vowel Change. Welsh took on vowels, or a vowel and a liquid, the seven consonants p, f, c, b, d, g, m, became respectively b, d, g, f, dd, - - - , where "- - -" represents the lost voiced spirant r. Examples: Latin cupiditas gave cibud; Tactus gave the Bretons call their language Bremonek; the Welsh bards sometimes call Welsh Brythonog: both forms imply an original Brittonica.

The i was short: Sabrina would have given Hefrin in Welsh.
WALES

Tegyd; labōrem gave lafus; sagitta gave saeth; rēmus gave rheuf. This change is called the "soft mutation." (2) After nasals 'p,' 't,' 'k,' 'd,' 'g' in Latin rhymes, remaining between vowels, though now written u, as in cited from cētum. A consonant occurring medially is, generally speaking, invariable in the present language, and the p and d of cupidōs are b and dd in cybbed; but with the initial consonant the case is different. In one combination the initial may remain; thus oeinos cupidōs gave cybbdd, "one miser"; in another combination it may have originally stood between vowels, and so is mutated, as in duōs cupidōs, which gave dau cybbdd, "two misers." Thus arose the system of "initial mutation": an initial consonant may retain its original form, or may undergo any of the changes to which it is subject. The names given above to these changes are the ones in general use in the northern Welsh, and have, therefore, been selected. These changes occur when the liquids s and r were brought into the system, the initial consonants remaining as regarded as "radical." The initial mutations, then, are as follows:

Radical.

<table>
<thead>
<tr>
<th>p</th>
<th>t</th>
<th>c</th>
<th>d</th>
<th>b</th>
<th>g</th>
<th>m</th>
<th>ll</th>
<th>rh</th>
</tr>
</thead>

<th>ch</th>
</tr>
</thead>
</table>

The initial mutation of any word depends upon its position in the sentence, and is determined by a grammatical rule which can ordinarily be traced to a generalization of the original phonetic conditions. Thus the second element of a compound word, even through written and accented as a separate word, has a soft initial, because in Brythonic the first element of a compound generally ended in a vowel, as in the name Maglo-camus. The more important rules for initial mutation are the following: the soft mutation occurs in a feminine singular noun after the article, thus y fâm, "the mother" (radical mam); in an adjective following a feminine singular noun, as in mam dda, "a good mother" (dda, "good"); in a word with an initial liquid, and in adjectives derived from such words, because this order represents what was originally a compound; in a noun following dy, "thy," and et, "his," thus dy ben, "thy head," et ben, "his head," (ben, "head"); in the object after a verb; in a name, and in adjectives derived from such words. The nasal mutation occurs after fy, "my," and ym, "in," thus fy mhen, "my head," ym Nhailagath, "at Talgarth." The nasal mutation also occurs by -dd, "and," dd, "with," et, "her," thus a phen, "and a head," ei phen, "her head." The names of the parts of the Welsh vocabulary are: 3. Vowel Changes.—(1) Long a, whether from Aryan ā or ē or from Latin ā, becomes aw in monosyllables, as in brad, "brother from abroad;" in the penultimate it is a, as in bredder, "brothers," in the ultima aw, after o, as in pecchand, now pecched, from pecclām. Long i, whether from Aryan ē or ī, or from Latin i, remains i, as see examples above. Latin e was identified with a native diptongh ing, and becomes apē, as in rheuf from rēmus. Latin ø and a appear as u; see examples above. A long vowel when unaccented counts short, thus pecchērem treated as "pecchērem, gave pecchedur. (2) Short a, the penult of a wordending in a liquid (e, ø, i), and the final e, is lost when a liquid occurs immediately after it, thus "bards gave bariad, but pl. "bards gave beired; epischo gave eispych, "bishops." This change also occurs by d, "and," dd, "with," et, "her," thus a phen, "and a head," ei phen, "her head." The nasal mutation occurs after fy, "my," and ym, "in," thus fy mhen, "my head," ym Nhailagath, "at Talgarth." The nasal mutation also occurs by -dd, "and," dd, "with," et, "her," thus a phen, "and a head," ei phen, "her head." The names of the parts of the Welsh vocabulary are: 3. The nasal mutation also occurs by -dd, "and," dd, "with," et, "her," thus a phen, "and a head," ei phen, "her head."
In a simple interrogative sentence the introductory particle before the verb is a, and the positive answer consists in a repetition of the verb; e.g., *daew Dafydd ò Daw* (1878), "Will David come?" Yes." If the verb is negative, the interrogative particle precedes the verb. In sentences in which a noun comes first, the interrogative particle is *at*, and the answer is always, positive i.e., "negative *nag*; is *a* *daew Dafydd ò dw.* Is it David who will come? 

A relative pronoun immediately precedes its verb and can only be separated from it by an infixed pronoun, thus *daew Dafydd ò priydd, *"David is he who will come."* If the relative is the object of a preposition, the latter is put at the end of the clause, and has a personal ending, thus *y ty bant ydodo, literally, "the house which I was in."*

The particle *at* is the only relative pronoun; when the subject is a noun the verb is put in the third person singular; thus *carant, "they love," can take a pro-

nominal suffix, "theirs," thus *cynt *at *fy* dynion (not *carant *y dynion, which can only mean "they love them"). In relative clauses the verb is sometimes made to agree; but in the oldest poetry we generally find the singular verb, as in the oft-repeated Godolfin phrase *Gwr ò gael Gwraith, "men who went (to Caernarvon)" (not *caethu a gaelu*).

**WALEWSKI—WALKER, F. A.**

A member of the Academy of Fine Arts and a grand cross of the Legion of Honour.

**WALFISH BAY,** a harbour of South-West Africa with a coast-line of 20 m. terminated southward by Pelican Point in 29° 54' S., 14° 27' E. It belongs to Great Britain, together with a strip of territory extending 15 m. along the coast south of Pelican Point and with a depth inland from 10 to 15 m. The total area is 430 sq. m. Except seaward Walfish Bay is surrounded by German South-West Africa. The northern boundary is the Swakop river; east and south there are no natural frontiers. The coast district, composed of sand dunes, is succeeded by a plateau covered in part with sparse vegetation. The river Kuisip, usually dry, has its mouth in the bay—which forms the finest harbour along a coast-line of over 1000 m. The harbour is provided with a pier 200 yds. long and is safe in all weathers. It was formerly frequented by whaling vessels (hence its name). The town has a small trade with the Heringo of the adjoining German protectorate. A tramway, 11 m. long, runs inland to Rokkool on the German frontier. Pop. (1904), 997, including 144 whites.

Walfish Bay forms a detached portion of the Cape province of the Union of South Africa. It was proclaimed British territory on the 12th of March 1878, and was annexed to Cape Colony on the 7th of August 1884 (see AFRICA, § 3). The delimitation of the southern frontier was in 1900 referred to the king of Spain as arbitrator between Great Britain and Germany.

**WALKER, FRANCIS AMASA** (1840-1897), American soldier and economist, was born in Boston, Massachusetts, on the 2nd of July 1840. His father, Amasa Walker (1799-1875), was a distinguished economist, who, retiring from commercial life in 1849, lectured on political economy in Oberlin College from 1842 to 1848, was examiner in the same subject at Harvard from 1853 to 1860, and lecturer at Amherst from 1850 to 1860. He was a delegate to the first international peace congress in London 1845, and in 1849 to the peace congress in Paris. He was secretary of state of Massachusetts from 1851 to 1853 and a representative in Congress 1862-1863. His principal work, *The Science of Wealth,* attained great popularity as a textbook. Francis Walker graduated at Amherst College in 1860, studied law, and fought in the Northern army during the whole of the Civil War of 1861-65, rising from the rank of sergeant-major to that of brevet brigadier-general of volunteers—awarded him at the request of General Winfield S. Hancock. As a soldier he excelled in analysis of the position and strength of the enemy. In 1863 he was captured and detained for a time in the famous Libby Prison, Richmond. After the war he became editorial writer on the Springfield (Massachusetts) *Republican,* and in 1869 was appointed by President Lincoln to the position of a special commissioner of the Navajo Indian, and was made a member of the United States Indian commission. In 1871 he was sent to the office of the U.S. Commissioner of Indian Affairs (1871-1872) commissioner of Indian affairs. From 1873 to his death his work was educational, first as professor (1872-1881) of political economy in the Sheffield Scientific School at Yale, and then as president of the Massachusetts Institute of Technology, Boston. While superintendent of the census he increased the scope and accuracy of the records; and at the Institute of Technology he enlarged the resources and numbers of the Institution, which had 100 students when he assumed the presidency and 1100 at his death. In other fields he promoted common-school education (especially in manual training), the Boston park system, and the work of the public library, and took an active part in the discussion of monetary, economic, statistical and other public questions, holding many offices of honour and responsibility. As an author he wrote on governmental treatment of the Indians, *The Wages Question* (1876), *Money* (1878), *Land and its Rent* (1883) and general political economy (1883 and 1884), besides producing monographs on the life of General Hancock (1884) and the history of his own *Second Army Corps* (1886). As an economist, from the time of the appearance of his book on the subject, he so effectively combated the old theory of the "wage-fund" as to lead to its abandonment or material modification by American students; while in his writings on finance, from the 1870s to the end of his life, he advocated international
himatism, without, however, seeking to justify any one nation in the attempt to maintain parity between gold and silver. A collection of posthumously published *Discussions in Education* (1890) was made up of essays and addresses prepared after his taking the presidency of the Institute of Technology: their most noteworthy argument is that chemistry, physics and the other sciences promote a more exact and more serviceable mental training than metaphysics or rhetoric. Walker's general tendency was towards a rational conservatism. On the question of rent he called himself a "Ricardian of the Ricardians." To his *Wages Question* is due in great part the study formed by English students of the place and functions of the employer in modern industrial economics. A remarkable feature of his writings is his treatment of economic tendencies not as mere abstractions, but as facts making for the happiness or misery of living men. General Walker died in Boston on the 5th of January 1867.

**WALKER, FREDERICK** (1840-1875), English subject painter, the son of a designer of jewelry, was born in Marylebone, London, on the 24th of May 1840. When very young he began to draw from the antique in the British Museum, and as a boy he was placed in the office of an architect named Baker. The occupation proved uncongenial; at the end of eighteen months he resumed his work from the Elgin marbles at the British Museum, and attended Leigh's life school in Newman Street. In March 1858 he was admitted a student of the Royal Academy. But his study in the academy schools was disconnected, and ceased before he reached the life class, as he was anxious to begin earning his own living. As a means to this end, he turned his attention to designing for the wood-engravers, and worked thereon during the following six years, and for about two years in the studio of J. W. Tytler, under whose tuition he quickly mastered the technicalities of drawing on wood. His earliest book illustrations appeared in 1860 in *Once a Week*, a periodical to which he was a prolific contributor, as also to the *Cornhill Magazine*, where his charming designs appeared to the works of Thackeray and those of his daughter. These woodcuts, especially his illustrations to Thackeray's *Adventures of Philip and Denis Dauze*, are among the most spirited and artistic works of their class, and entitle Walker to rank with Millais at the very head of the draughtsmen who have dealt with scenes of contemporary life. Indeed, by his contributions to *Once a Week* alone, he has won an immediate reputation as an artist of rare accomplishment, and although he was associated on that periodical with such men as Millais, Holman Hunt, Leech, Sandsy, Charles Keene, Tenniel, and Du Maurier, he more than held his own against all competitors. In the intervals of work as a book illustrator he practised painting in water-colours, his subjects being frequently more considered and refined repetitions in colour of his black-and-white designs. Among the more notable of his productions in water-colour are "Spring," "A Fishmonger's Shop," "The Ferry," and "Phillip in Church," which gained a medal in the Paris International Exhibition of 1867. He was elected an associate of the Society of Painters in Water Colours in 1864 and a full member in 1866; and in 1871 he became an associate of the Royal Academy. In this same year he was made an honorary member of the Belgian Society of Painters in Water Colours. His first oil picture, "The Lost Path," was exhibited in the Royal Academy in 1863, where it was followed in 1867 by "The Bathers," one of the artist's finest works, in 1868 by "The Vagrants," now in the National Gallery of British Art; in 1869 by "The Old Gun," and in 1871 by "The Plough." His powerful and impressive rendering of ruddy evening light, of which the landscape was studied in Somerset. In 1871 he exhibited his tragic life-sized figure of "A Female Prisoner at the Bar," a subject which now exists only in a finished oil study, for the painter afterwards effaced the head, with which he was dissatisfied, but was prevented by death from again completing the picture. The last of his fully successful works was "A Harbour of Refuge," shown in 1872 (also in the National Gallery of British Art); for "The Right of Way," exhibited in 1875, bears evident signs of the artist's failing strength. He had suffered indeed for some years from a consumptive tendency; in 1868 he made a sea voyage, for his health's sake, to Venice, where he stayed with Orchardson and Birken Foster, and at the end of 1873 he went for a while to Algiers with J. W. North, in the hope that he might derive benefit from a change of climate. But, returning in the bitter English spring, he was again prostrated; and on the 5th of June 1875 he died of consumption at St Fillans, Perthshire.

The works of Frederick Walker are thoroughly original and individual, both in the quality of their colour and handling and in the extreme refinement of natural humanity. His colour, especially in his water-colours, is distinctive, powerful and full of delicate gradations. He had an admirable sense of design, and the figures of his peasants at their daily toil show a grace and sweeping largeness of line in which can be plainly traced the effect produced upon his taste by his early study of the antique; at the same time the sentiment of his subjects is unfailingly refined and poetic. His vigour of design may be seen in his poster for Wilkie Collins's *The Woman in White*, now in the National Gallery of British Art.

See *Life and Letters of Frederick Walker, A.R.A.*, by John George Marks (1896), a full biography of a personal rather than a critical kind, *Frederick Walker and his Works*, by Claude Phillips (1897), which is supplemented by an excellent critical supplement to the large volume. See also *Essays on Art*, by J. Conyngham Carr, which includes a judicious essay on Walker.

**WALKER, GEORGE** (c. 1618-1660), hero of the siege of Londonderry, was the son of George Walker, rector of Kilmore and chancellor of Armagh (d. 1677), and of Ursula, daughter of Sir John Stanhope of Melwood, and is said to have been born in 1618 in Tyrone. He was educated at Glasgow University, and, appointed to the livings of Lessan and Desertlyn, in the diocese of Armagh, near Londonderry, in 1660. In 1674 he obtained that of Donaghmore, which he held with Lessan. At the outbreak of the Civil War in Ireland towards the close of 1668, Walker, though in Holy Orders and advanced in years, raised a regiment and endeavoured to concert measures with Robert Lundy, the acting governor of Londonderry, for the defence of Dungannon. But Lundy, after having sent some troops to his support, ordered their withdrawal and the abandonment of the place on the 14th of March 1669. On the 17th of March Walker marched with his men to Strabane, and subsequently ordered by Lundy to move to Rash and then to St Johnstown, 5 m. from Londonderry. On the approach of the enemy (April 13th) Walker rode hastily to Londonderry to inform Lundy, but was unable to convince him of his danger. He returned to his men at Lifford, where, on the 14th, he took part in a brush with the enemy, afterwards following the retreat of the army to Londonderry. The town was in great confusion, and Walker found the gates shut against him and his regiment. He was forced to pass the night outside, and only entered the next day "with much difficulty and some violence upon the Centry." Immediately on his arrival he urged Lundy to take the field and refused the demand to disband his own soldiers. On the 17th of April Lundy determined to give up the town to James, and called a council from which Walker and others were especially excluded; but the next day the king and his troops, who had advanced to receive the surrender, were fired upon from the walls contrary to Lundy's orders, and the arrival of Captain Adam Murray with a troop of horse saved the situation. Lundy was deprived of all power, and was allowed to escape in disguise from the town. On the 19th of April Walker and Baker, joined by the joint-governors. Walker commanded fifteen companies, amounting to 900 men, and to him was also entrusted the supervision of the commissariat. He showed great energy, courage and resource throughout the siege, and led several successful sallies. Meanwhile his duties as a clergyman were not neglected. The Nonconformists were allowed the use of the cathedral on Sunday afternoons, but in the morning Walker preached. Those few of his sermons which remain, though simple in their language, are eloquent and inspiring. Meanwhile he had borne with jealousies and suspicions within the town; but he succeeded in dispelling all misgivings and in reaffirming his
WALKER, H. O.—WALKER, O.

credit with the garrison. At the close of the siege, which lasted 150 days, the town was at the last extremity; but at length, on the 30th of July, Walker preached the last of the sermons by which he had helped to inspire its defence. An hour afterwards the ships were seen approaching, and the town was relieved.

As regards the general course of the war the importance of the successful resistance at Londonderry can hardly be exaggerated. It was the first open act of hostility in Ireland against James, and the disaster to his arms not only embarrassed his campaign in the north but prevented the invasion of Scotland and England, and Walker's share in it was abundantly recognized. He sailed for Scotland and England on the 9th of August, and was everywhere welcomed with immense public enthusiasm. On the 29th of August he was graciously received at Hampton Court by William and Mary, before whom he had with good sense refused to appear in his military costume, and delivered to them the petition from Londonderry. William presented him with £3000, part of which he appears to have given to the widow of Baker, his fellow-governor, who died during the siege. Shortly after he began a large and enlarged edition of the "British" of Bishop Hopkins, whom it was determined to remove, only died three weeks before Walker, the latter was never consecrated.

Walker succeeded in obtaining a grant of £1000 for Londonderry from the city companies, and on the 18th of November his petition to the House of Commons for relief for the widows, orphans, clergy and dissenting ministers was read, and the king was asked to distribute £10,000 among them (House of Commons Journals, vol. x. p. 288). On the following day Walker was called in, received the thanks of the House, and made a short and dignified reply. On the 8th of October he had been granted the degree of D.D. at Cambridge in his absence, and on his return journey to Ireland he received the same diploma at Oxford (Feb. 1690). Walker met William on his arrival in Ireland on the 14th of June 1690 at Belfast, and followed his army. He was present at the battle of the Boyne on the 1st of July, but in what capacity, whether as spectator, as combatant or as minister to tend the wounded, is uncertain.1 He was shot through the body at the passage of the river, according to one account, while he was going to the aid of the wounded Schomberg (G. Story, A True... History of the Affairs in Ireland, p. 82), and died almost instantly. It was said, without any substantial foundation, that upon reference to Bishop Hopkins, whom it was determined to remove, only died three weeks before Walker, the latter was never consecrated.

Walker married Isabella Maxwell of Finnebrogue, and left several sons, four of whom during his lifetime were in the king's service, and from one of whom at least there are descendants at the present day.

While in London Walker had published A True Account of the Siege of Londonderry (1689), dedicated to the king, which went through several editions and was translated for perusal abroad. This pamphlet, and the ovations received by Walker in London, excited some jealousies, which had been subdued in the house of lords but which were now formulated in the Narrative (1698) of John Mackenzie, a dissenting minister who had been present during the siege. Walker was charged with having taken too much credit to himself. The truth of the charge was not questioned, but the纤小ness of his opponents. Bas insinuations were added and it was declared that Walker had never even held the post of governor. These accusations fall far below the weight of their own exaggeration. On the other hand, Walker's Account, though doubtless incomplete, is written with candour and simplicity and is free from any touch of egotistical self-consciousness; and both this tract and his subsequent letter to his correspondent, in which he enlarged on their dignity, as a restraint, to the pamphlets of his opponents. His character was proof against the perils which attend a sudden rise to fame and popularity, and his modesty is especially observed by several of his contemporaries. There exists also too much positive and independent evidence to permit any doubt whatever as to the greatness of Walker's services. Burnet, in a passage which was misquoted in his published history because of the controversy, says: "There was a minister in the place, Mr. Walker, who acted a very noble part in the government and defence of the town; he was but a man of ordinary parts, but they were suited to his station, and he did wonders."—American MSS., 6984 f. 329 b, printed by H. C. Foxcroft. Supplement to Burnet's Hist. of His Own Times, 1902, p. 321.

In the Siege of Derry (1689) the Rev. Philip Dwyer has collected the individual memoirs relating to Walker and the siege, and has reprinted in his volume Walker's True Account and Vindication, together with Walker's sermons, various other documents and valuable notes.

WALKER, HENRY OLIVER (1843— ), American artist, was born at Boston, Massachusetts, on the 14th of May 1843. He was a pupil of León Bonnat, Paris, and painted the figure and occasional portraits, but later devoted himself almost exclusively to mural decoration. His paintings symbolizing lyric poetry, for the Congressional Library, Washington; and his decorations for the Appellate Court House, New York; Bowdoin College, Maine; the gallery of the American house, Newark, New Jersey, and the Capitol at Saint Paul, Minnesota, are among his most important works. He became a member of the National Academy of Design, New York, in 1902.

WALKER, HORATIO (1858— ), American artist, was born at Listowel, Ontario, Canada, on the 12th of May 1858. When he was a child his family settled at Rochester, New York. Although entirely self-taught, he became a distinguished painter of animals, the figure and landscape. His pictures, principally of Canadian peasant life and scenes, show the influence of Drovers and Miller, manifest in their feeling for largeness of composition, in solidity of painting and in the choice of theme. He became a member of the National Academy of Design, New York, in 1891; of the American Water Color Society and of the Royal Institute of Painters in Water Colours, London. He received a medal and a diploma at Chicago, 1893; and medals at Buffalo, 1901; Charleston, 1902; and St. Louis, 1904. In 1888 he won the Evans prize of the American Water Color Society, New York.

WALKER, JOHN (1732-1822), English actor, philologist and lexicographer, was born at Coley Hatch, Middlesex, on the 18th of March 1732. Early in life he became a teacher; his theatrical engagements including one with Garrick at Drury Lane, and a long season in Dublin. In 1768 he left the stage. After some experience in conducting a school at Kensington he commenced to teach elocution, and in this found his principal employment for the rest of his life. In 1775 he published his Rhyming Dictionary, which achieved a great success and has been repeatedly reprinted, and in 1791 his Critical Pronouncing Dictionary, which achieved an even greater reputation, and has run into some forty editions. He was the friend of the leading literary men of his time, including Johnson and Burke. He died in London on the 1st of August 1807.

WALKER, OBADIAH (1616-1690), master of University College, Oxford, was born at Darfield near Barnsley, Yorkshire, and was educated at University College, Oxford, becoming a fellow and tutor of this society and a prominent figure in university circles. In July 1648 the action of parliament deprived him of his academic appointments, and he passed some years in teaching, studying and travelling, returning to Oxford at the restoration of 1660, and beginning a few years later to take a leading part in the work of the University College. In June 1676 he was elected to the headship of this foundation, and in this capacity he collected money for some rebuilding, and forwarded the preparation of a Latin edition of Sir John Selden's Life of Alfred the Great, published by the college. This was the time of Titus Oates and the popish plots, and some of Walker's writings made him suspect; however, no serious steps were taken against him, although Oxford booksellers were forbidden to sell his book, The benefic of our Salvator Jesus Christ to mankind, and he remained a Protestant, in name at least, until the accession of James II. Soon after this event he came forward as

1 Luttrell writes in his diary, vol. 2, p. 17 (Feb. 20, 1689-1690), "Mr. Walker of Londonderry has taken his leave of the king to go into Ireland on special command," and again, vol. 2, p. 44 (May 17, 1690), "Letters from Ireland say that Dr. Walker, late governor of Londonderry, had a regiment of foot given him," but there appears to be no official record of his having received a commission at this time.
a Roman Catholic, and he advised the new king with regard to affairs in Oxford, being partly responsible for the tactless conduct of James in forcing a quarrel with the fellows of Magdalen College. Mass was said in his residence, and later a chapel was opened in the college for the worship of the Roman Church; he and others received a royal licence to abstain themselves from the services of the English Church, and he obtained another to supervise the printing of Roman Catholic books. In spite of growing unpopularity he remained loyal to James, and when the king fled from England, Walker left Oxford, doubtless intending to join his master abroad. But in December 1668 he was arrested at Sissingbourne and was imprisoned; then, having lost his mastership, he was charged at the bar of the House of Commons with changing his religion and with other offences. Early in 1669 he was released from his confinement, and after subsisting for some years largely on the charity of his friend and former pupil, Dr John Radcliffe, he died on the 21st of January 1690.

Walker's principal writings are: Of education, especially of young gentlemen (Oxford, 1673, and six other editions); Ars rationis ad mentem nominalium libri tres (Oxford, 1673); and Greek and Roman History Illustrated by Coins and Medals (London, 1692).

WALKER, ROBERT (d. 1658). British painter, was a contemporary and to a slight extent a follower of Van Dyck. The date of his birth is uncertain, and no details are known of his family life. Van Dyck's influence is evident in his work, though not to the extent of being either his follower or imitator. The style of his work was still a considerable degree of individuality and developed a sound style of his own which was more severe and restrained than that of the greater master. His greatest vogue was at the time of the Commonwealth, for in addition to several portraits of Cromwell he painted other portraits of Lambert, Ireton, Fleetwood, and many more members of the Parliamentary party. In 1652 he was given rooms in Arundel House in the Strand, London, where he resided for the rest of his life. He died either in 1658 or in 1660, the authority for the earlier date being an inscription on an engraved portrait by Lombart. His work had much merit; it was vigorous and showed sound character. Several of his portraits, among them the portrait of William Faithorne the elder, are in the National Portrait Gallery, and there are others of notable importance at Hampton Court and in the University Galleries at Oxford. One of his portraits of Cromwell is in the Pitti Palace, where it is ascribed to Lely; it was bought in the artist's lifetime, but after the Protector's death, by the grand duke Ferdinand II. of Tuscany. Another is at Warwick Castle.

Walker painted also Robert Cromwell and his wife Elizabeth Summerly, the two youngest children of the Protector. The portrait of the latter, attended by a page who is fastening his sash at the waist (now in the National Portrait Gallery, transferred from the British Museum, to which it was bequeathed by Sir Henry Bathurst, descendant of Cromwell's friend, Nathaniel Rich) was called by Walpole "Cromwell and Lambert"; but it is now certain that the portrait represents Cromwell's son Richard. Elizabeth Cromwell, afterwards Mrs Claypole, the Protector's daughter, also sat to him. As no complete account of Walker's work is in existence (that of Walpole being very incomplete, while Cunningham passes him over entirely), it may be added that the artist twice painted John Evelyn, in different sizes, as well as Bradshaw, John Hampden, Colonel Thomas Sanders, Cornet Joyce, and Speaker Lenthall, as well as Sir William and Lady Walker, Mrs Thomas Knight, and General George Monk, during his stay at Cambridge. The members of his own family were painted by him early in his career. A portrait of Secretary Thurloe, which was in the Lord Northwick Collection, was attributed to him. As Walker was in the camp of the Parliamentarians and Dobson was the court painter at Oxford, few aristocratic persons sat to the former. Exceptions of Mary Capel, duchess of Beaufort (engraved by J. Nutting), Aubrey, last earl of Oxford, and James Graham, marquess of Montrose; even a portrait of Charles I. in armour, with his hand on his helmet, is credited by the English School. Among his other portraits exist, one at the National Portrait Gallery and the other at Oxford, engraved by Peter Lombart, and again, later, by T. Chambers. The library of the British Association for the Advancement of Sciences contains a copy of the Walker's copy of Titian's famous "Venus at her Toilet," highly esteemed by Charles I., is considered a work of great merit.

WALKER, ROBERT JAMES (1801–1866), American political leader and economist, was born in Northumberland, Pennsylvania, on the 23rd of July 1801. He graduated from the University of Pennsylvania in 1820 and practised law in Pittsburg from 1822 to 1826, when he removed to Mississippi. Though living in a slave state he was consistently opposed to slavery, but he favoured gradual rather than immediate emancipation, and in 1838 he freed his own slaves. He became prominent, politically, during the nullification excitement of 1832–1833, as a vigorous opponent of nullification, and from 1836 to 1845 he sat in the United States Senate as a Unionist Democrat. Being an ardent expansionist, he voted for the recognition of the independence of Texas in 1839 and for the joint annexation resolution of 1845, and advocated the nomination and election of James K. Polk in 1844. Walker's views were strongly influenced by the Unionist newspaper, the New York Herald, and was generally regarded as the most influential member of the cabinet. He financed the war with Mexico and drafted the bill (1849) for the establishment of the department of the interior, but his greatest work was the preparation of the famous treasury report of the 3rd of December 1845. Although inferior in intellectual quality to Alexander Hamilton's Report on Manufactures, presenting the case against free trade, it is regarded as the most powerful attack upon the protection system which has ever been made in an American state paper. The "Walker's Tariff" of 1846 was based upon its principles and was in fact largely the secretary's own work. Walker at first opposed the Compromise of 1850, but was won over later by the arguments of Stephen A. Douglas. He was appointed territorial governor of Kansas in the spring of 1857 by President Buchanan, but in November of the same year resigned in disgust, owing to his opposition to the Lecompton Constitution. He did not, however, break with his party immediately, and favoured the so-called English Bill (see Kansas); in fact it was partly due to his influence that a sufficient number of anti-Lecompton Democrats were induced to vote for the measure to secure its passage and opposed to the Union cause during the Civil War and in 1863–1864 as financial agent of the States did much to create confidence in Europe in the financial resources of the United States, and was instrumental in securing a loan of $250,000,000 in Germany. He practised law in Washington, D.C., from 1864 until his death there on the 11th of November 1869. Both during and after the Civil War he was a contributor to the "Controversial Monthly," for which he wrote from time to time, also, with James R. Gilmore, conducted.

For the tariff report see F. W. Taussig, "State Papers and Speeches on the Tariff" (Cambridge, 1879). WALKER, SEARS COOK (1805–1853), American astronomer, was born at Wilmington, Massachusetts, on the 28th of March 1805. Graduating at Harvard in 1825, he was a teacher till 1835, was an actuary in 1835–1845, and then became assistant at the Washington observatory. In 1847 he took charge of the longitude department of the United States Coast Survey, where he was among the first to make use of the electric telegraph for the purpose of determining the difference of longitude between two stations, and he introduced the method of registering transit observations electrically by means of a chronograph. He also investigated the orbit of the newly discovered planet Neptune. He died near Cincinnati on the 20th of January 1853. His brother Timothy (1802–1856) was a leader of the Ohio bar.

WALKER, THOMAS (1784–1836). English police magistrate, best known as author of The Original, was born on the 10th of October 1784 at Charlton-cum-Hardy, near Manchester, where his father was a prosperous cotton merchant and an active Whig politician. He was educated at Cambridge and called to the bar, and after devoting some years mainly to the study of the Poor Law was made police magistrate in Lambeth in 1829. In 1835 he started his weekly publication The Original, containing his reflections on various social subjects and especially on eating and drinking; and it is in the history of gastronomy, and the art of dining, that this curious and amusing work is famous. The weekly numbers continued for six months, and subsequently were republished, after Walker's death on the 20th of January 1836, in an American selection (1837), in editions by W. P. Jerroll (with memoir) (1834), W. A. Guy (1857), and Henry Morley (1887), and in another selection of Sir Henry Cole ("Felix Summerly"), called Aristology (1881).
WALKER, W.—WALL, R.

WALKER, WILLIAM (1824-1860). American adventurer, was born in Nashville, Tennessee, on the 8th of May 1824. After graduating from the university of Nashville in 1838, he studied law, was admitted to the bar, and subsequently spent a year in the study of medicine at Edinburgh and Heidelberg. He practised medicine for a few months in Philadelphia and then removed to New Orleans, where he engaged in journalism. In 1850 he migrated to California and engaged in newspaper work at San Francisco and later at Mobile, where he also practised law. On the 15th of October 1853 he sailed from San Francisco with a filibustering force for the conquest of Mexican territory. He landed in Lower California, and on the 18th of January 1854 he proclaimed this and the neighbouring State of Sonora an independent republic. Starvation and Mexican attacks led to the abandonment of this enterprise, and Walker resumed his journalistic work in California. On the 4th of May 1855, with fifty-six followers, Walker again sailed from San Francisco, this time for Nicaragua, where he had been invited by one of the belligerent factions to continue his aid. In October Walker seized a steamer on Lake Nicaragua belonging to the Accessory Transit Company, a corporation of Americans engaged in transporting freight and passengers across the isthmus, and was thus enabled to surprise and capture Granada, the capital and the stronghold of his opponents, and to make himself master of Nicaragua. Peace was then made; Patricio Rivas, who had been neutral, was made provisional president, and Walker secured the real power as commander of the troops. At this time two officials of the Transit Company determined to use Walker as their tool to get control of that corporation, then dominated by Cornelius Vanderbilt, and they advanced him funds and transported his recruits from the United States free of charge. In return for these favours, Walker seized the property of the company, on the pretext of a violation of its charter, and turned over its equipment to the men who had befriended him. On the 20th of May 1856 the new government was formally recognized at Washington by President Pierce, and on the 3rd of June the Democratic national convention expressed its sympathy with the efforts being made to "regenerate" Nicaragua. In June Walker was chosen president of Nicaragua, and on the 22nd of September, from economic necessity, and also to gain the sympathy and support of the slave states in America, he repealed the laws prohibiting slavery.

Walker managed to maintain himself against a coalition of Central American states, led by Costa Rica, which was aided and abetted by agents of Cornelius Vanderbilt, until the 1st of May 1857, when, to avoid capture by the natives, he surrendered to Commander Charles Henry Davis, of the United States navy, and returned to the United States. In November 1857 he sailed from Mobile with another expedition, but soon after landing at Punta Arenas he was arrested by Commodore Hiram Paulding of the American navy, and was compelled to return to the United States as a paroled prisoner. On his arrival he was released by order of President Buchanan. After several unsuccessful attempts to return to Central America, Walker finally sailed from Mobile in August 1860 and landed in Honduras. Here he was taken prisoner by Captain Salmon, of the British navy, and was surrendered to the Honduran authorities, by whom he was engaged to be shot. He was executed on the 12th of September 1860.

See Walker's own narrative, accurate as to details, The War in Nicaragua (Mobile, 1860); William V. Wells, Walker's Expedition to Nicaragua (New York, 1856); Charles William Doubleday, Reminiscences of the "Filibuster" War in Nicaragua (New York, 1860), and James Jeffrey Roberts, History of the Panama Expedition (London, 1858), abridged and reprinted as Byways of War (Boston, 1901). (W. O. S.)

WALKING RACES, a form of athletic sports, either on road or track. Road walking is the older form of the sport. The records for the chief walking distances were as follows in 1910—

The record distance walked in 1 hour was 8 m. 339 yds. by the English amateur G. E. Larner in 1905; in 8 hours, 50 m. 1190 yds. by another English amateur, J. Butler, in 1905; in 24 hours, 131 m. 802 yds. by T. E. Hammond in 1908.

About the year 1875 there was a revival of interest in professional walking, which took the form of "go-as-you-please" competitions, extending over several days, usually six. These may be classed as walking contests, for, although running was allowed, it was seldom practised, excepting for a few moments at a time, for the purpose of relief from cramped muscles. The great difficulty in competitive walking is to keep within the rules. A "fair gait" is one in which one foot touches the ground before the other leaves it, only one leg being bent in stepping, namely, that which is being put forward.

WALL, RICHARD (1665-1748), diplomatist and minister in the Spanish service, belonged to a family settled in Waterford. As he was a Roman Catholic he was debarred from public service at home, and like many of his countrymen he sought his fortune in Spain. He served, probably as a soldier in one of the Irish regiments of the Spanish army, during the expedition to Sicily in 1718, and was present at the sea fight off Cape Passaro. During the following years he continued to be employed as an officer, but in 1727 he was appointed secretary to the duke of Liria, son of the duke of Berwick, and Spanish ambassador at St Petersburg. Wall's knowledge of languages, his adaptability, his quick Irish wit and ready self-confidence made him a great favourite, not only with the duke of Liria, but with other Spanish authorities. Spain was at that time much dependent on the ability of foreigners, and for a man of Wall's parts and character there were ample openings for an important and interesting career. The climate of St Petersburg seems to have been too much for him, and he soon returned to military service in Italy. It is said that when he was presented to the duke of Montemar, the Spanish general, and was asked who he was, he replied, "The most important person in the army after your excellency, for you are the head of the serpent, and I am the tail." He became known to Don José Patiño, the most capable minister of King Philip V., and was sent by him on a mission to Spanish America—a very rare proof of confidence towards a man of foreign origin. He is also said to have laid a plan for retaking Jamaica from the English. In 1747 he was employed in the negotiations for the peace of Aix-la-Chapelle, and in 1748 was named minister in London. In England he made himself very popular. Though an exile through the operation of the Penal Laws, and though he proved loyal to his adopted country, he became a constant partisan of an English alliance. His views recommended him to the favour of King Ferdinand VI. (1746-1750), whose policy was resolutely peaceful. In 1752 Wall was recalled from London to assist in completing a treaty of commerce with England, which was then being negotiated in Madrid. Wall now became the candidate of the English party in the Spanish court for the post of Minister of Foreign Affairs, in opposition to the leader of the French party, the marquis de la Ensenada. He obtained the place in 1752, and in 1754 he had a large share in driving Ensenada from office. He retained his position until 1764. The dispatches of the English minister, Sir Benjamin Keene, and of his
successor, Lord Bristol, contain many references to Wall. They are creditable to him. Though a constant partisan of peace and good relations with England, Wall was firm in asserting the rights of the government he served. During the early stages of the Seven Years' War (1756-1763) he insisted on claiming compensation for the excesses of English privateers in Spanish waters. He frequently complained to the English ministers of the difficulties which the violence of these adventurers put in his way. As a foreigner he was subjected of undue favour to England, and was the object of incessant attacks by the French party. The new king, Charles III. (1759-1788), continued Wall in office. When war was declared by Spain in 1761 the minister carried out the policy of the king, but he confessed to the English ambassador, Lord Bristol, that he saw the failure of his efforts to preserve peace with grief. The close relations of Charles III. with the French branch of the House of Bourbon made Wall's position as foreign minister very trying. Yet the king, who detested changing his ministers, refused all his requests to be allowed to retire, till Wall extorted words; for by elaborately afflicting a disease of the eyes which was in fact imaginary. The king gave him handsome allowances, and a grant for life of the crown land known as the Soto de Roma, near Granada, which was afterwards conferred on Godoy, and finally given to the duke of Wellington. Wall lived almost wholly at or near Granada, exercising a plentiful hospitality to all visitors, and particularly to English travellers, till his death in 1778. He left the reputation of an able minister and a very witty talker.

A full account will be found in volume iv. of Coke's Memoirs of the Kings of Spain of the House of Bourbon (London, 1815). Further details of his early career can be gathered from the Diario del viaje a Moscawa, 1727-1730, of the duke of Liria (vol. xiii. of the Documentos inéditos para la historia de España, (Madrid, 1842, et seq.).

WALL, O. Eng. wall, wall, Mid. Eng. wal, welle, adapted from Lat. vallum, rampart; the original O. Eng. word for a wall was wdg or wdec), a solid structure of stone, brick or other material, used as a defensive, protecting, enclosing or dividing fence, or as the enclosing and supporting sides of a building, house or room. The Roman vallum was an earth rampart with stakes or palisades (vallas, stake; Gr. ἅνκας, nail) and the Old English word was particularly applied to such earth walls; for the remains of the Roman walls in Britain see Bretain. The word, however, was also applied to stone defensive walls, for which the Latin word was muraus. The history of the wall as a means of defence will be found in the article FORTIFICATION and STRENGTH, the architectural and constructional side under the headings ARCHITECTURE, MASONRY and BRICKWORK. In anatomy and zoology the term “wall,” and also the Latin term paries, is used for an investing or enclosing structure, as in “cell-walls,” walls of the abdomen, &c. In the days when footpaths were narrow and ill-paved and the existent in the streets of towns and when the gutters were often overflowing with water and filth, the side nearest to the wall of the bordering houses was safest and cleanest, and hence to walk on that side was a privilege, hence the expressions “to take” or “to give the wall.” The term “wall-rib” is given in architecture to a half-ribbed bedded in the wall, to carry the web or shell of the vault. In Roman and in early Romanesque work the web was laid on the top of the stone courses of the wall, which had been cut to the arched form, but as this was often irregularly done, and as sometimes the courses had sunk owing to the drying of the mortar, it was better to have the ribs carry the web; half of this rib was sunk in the wall and the other half moulded like the transverse and diagonal ribs, so that if the wall sank, or if it had to be taken down from any cause, the vault would still retain its position.

The word “wall eye” or “wall-eyed” is applied to a condition of the eye, particularly of a horse, in which there is a large amount of white showing or there is absence of colour in the iris, or there is leucoma of the cornea. It is also applied to the heads of other animals, to certain fish. The word has no connexion with “wall” as above, but is from the Icelandic negl. eygr, wafi, a beam, stye in the eye, and eygr, eyed.

WALLABY, a native name, used in literature for any member of a section of the zoological genus Macropus, with naked muffle, frequenting forests and dense scrubs. With respect to their size they are distinguished as large wallabies and small wallabies, some of the latter being no bigger than a rabbit. From the localities in which they are found they are also called brush kangaroos. See Kangaroo.

WALLACE, ALFRED RUSSEL (1823— ), British naturalist, was born at Usk, in Monmouthshire, on the 8th of January 1823. After leaving school he assisted an elder brother in his work as a land surveyor and architect, visiting various parts of England and Wales. Living in South Wales, about 1840 he began to take an interest in botany, and began the formation of a herbarium. In 1847 he took his first journey out of England, spending a week in Paris with his brother and sister. In 1844—1845, while an English master in the Collegiate School at Leicester, he made the acquaintance of H. W. Bates, through whose influence he became a beetle collector, and with whom he started in 1848 on an expedition to the Amazon. In about a year the two naturalists, as Wallace and Bates, respectively wrote an account of their travels and observations. Wallace's Travels on the Amazon and Rio Negro was published in 1853, a year in which he went for a fortnight's walking tour in Switzerland with an old school-fellow. On his voyage home from South America the ship was burnt and all his collections lost, except those which he had despatched beforehand. After spending a year and a half in England, during which time, besides his book on the Amazon, he published a small volume on the Palm Trees of the Amazon, he started for the Malay Archipelago, exploring, observing and collecting from 1854 to 1862. He received letters from Sumatra, Java, Borneo, Celebes, the Moluccas, Timor, New Guinea and the Aru and Ké Islands. His deeply interesting narrative, The Malay Archipelago, appeared in 1869, and he also published many important papers through the London scientific societies.

The chief parts of his vast insect collections became the property of the late W. W. Saunders, but subsequently some of the most important groups passed into the Hope Collection of the university of Oxford and the British Museum. He discovered that the Malay Archipelago was divided into a western group of islands, which in their zoological affinities are Oriental, and an eastern, which are Australian. The Oriental wallabies became convinced of the truth of evolution, and originated the theory of natural selection during these travels. In February 1855, staying at Sarawak, in Borneo, he wrote an essay "On the Law which has regulated the Introduction of New Species" (Ann. and Mag. Nat. Hist., 1855, p. 184). He states the law as follows: "Every species has come into existence by successive steps which both in time and space with a pre-existing closely allied species." He justly claims that such a law connected and explained a vast number of independent facts. It was, in fact, a cautious statement of a belief in evolution, and for three years from the time that he wrote the essay he tells us that "the question of how changes of species could have been brought about was rarely out of my mind." Finally, in February 1858, when he was lying muffled in blankets in the cold fit of a severe attack of intermittent fever at Ternate, in the Moluccas, he began to think of Malthus' Essay on Population, and, to use his own words, "there suddenly flashed upon me the idea of the survival of the fittest." The theory was thought out during the rest of the age fit, drafted the same evening, written out in full in the two succeeding evenings, and sent to Darwin by the next post.

Darwin in England at once recognized his own theory in the manuscript essay sent by the young and almost unknown naturalist in the tropics, then a stranger to him. "I never saw more striking coincidence," he wrote to Lyell on the very day, on the 18th of June, when he received the paper. "If Wallace had my MS. sketch written out in 1842, he could not have made a better short abstract! Even his terms now stand as heads of my chapters." Under the advice of Sir Charles Lyell...
and Sir Joseph Hooker, the essay was read, together with an abstract of Darwin's own views, as a joint paper at the Linnean Society on the 1st of July 1858. The title of Wallace's section was "On the Tendency of Varieties to depart independently from the Original Type." The "struggle for existence," the rate of multiplication of animals, and the dependence of their average numbers upon food supply are very clearly demonstrated, and the following conclusion was reached: "Those that prolong their existence can only be the most perfect in health and vigour, ... the weakest and least perfectly organized must always succumb." The difference between Lamarck's theory and natural selection is very clearly pointed out. "The powerful retractional talons of the falcon and the cat tribes have not been produced or increased by the votation of those animals; but among the different varieties which occurred in the earlier and less highly organized forms of these groups, those always survived longest which had the greatest facilities for seizing their prey. Neither did the giraffe acquire its long neck by desiring to reach the foliage of more lofty shrubs, and constantly stretching its neck for the purpose, but because any varieties which occurred among its antitypes with a longer neck than usual, and which more easily reached their food, were enabled to outlive them." With such clear statements as these in the paper of the 1st of July 1858, it is remarkable that even well-known naturalists should have failed to comprehend the difference between Lamarck's and the Darwin-Wallace theory. Wallace also alluded to the resemblance of animals, and more especially of insects, to their surroundings, and pointed out that "those races having colours best adapted to concealment from their enemies would inevitably survive the longest." In 1871 Wallace's two essays, written at Samawak and Ternate, were published with others as a volume, *Contributions to the Theory of Natural Selection*. Probably, next to the *Origin of Species*, no single work has done so much to promote clear understanding of natural selection and confidence in its truth; for in addition to these two historic essays, there are others in which the new theory is applied to the interpretation of certain classes of facts. Thus one treats of "Mimicry" in animals, another on "Instinct," another on "Birds' Nests." Each of these served as an example of what might be achieved in the light of the new doctrine, which, taught in this way and in an admirably lucid style, was easily absorbed by many who found the more complete exposition in the *Origin* very hard to absorb.

In this work, and in many of his subsequent publications, Wallace differs from Darwin on certain points. Thus the two concluding essays contend that man has not, like the other animals, been produced by the unaided operation of natural selection, but that other forces have also been in operation. We here see the influence of his convictions on the subject of "spiritualism." More recently he expressed his dissatisfaction with the hypothesis of "sexual selection" by which Darwin sought to explain the conspicuous characters which are displayed during the courtship of animals. The expression of his opinion on both these points of divergence from Darwin will be found in *Darwinism* (1889), a most valuable and lucid exposition of natural selection, as suited to the later period at which it appeared as the *Essays* were to the earlier.

Darwin died some years before the controversy upon the possibility of the hereditary transmission of acquired characters arose over the writings of Weismann, but Wallace has freely accepted the general results of the German zoologist's teaching; and in *Darwinism* has presented a complete theory of the causes of evolution unmixed with any trace of Lamarck's use or disuse of inheritance, or Buffon's hereditary effect of the direct influence of surroundings. *Tropical Nature and other Essays* appeared in 1878, since republished combined with the 1871 *Essays*, of which it formed the natural continuation. One of the greatest of his publications was the *Geographical Distribution of Animals* (1876), a monumental work, which every student will maintain fully justifies his author's hope that it may bear a similar relation to the *Eleventh and Twelfth Chapters of the Origin of Species* as Mr. Darwin's *Animals and Plants under Domestication* bears to the first." *Island Life*, which may be regarded as a valuable supplement to the last-named work, appeared in 1880.

Turning to his other writings, Wallace published *Miracles and Modern Spiritualism* in 1881. Here is given an account of the reasons which induced him to accept beliefs which are shared by so small a proportion of scientific men. These reasons are purely experimental, and in no way connected with Christianity, for he had long before given up all belief in revealed religion. In 1882 he published *Land Nationalization*, in which he urged the necessity of state ownership of land, a principle which he had originated long before the appearance of Henry George's work. In *Forty-five Years of Registration Statistics* (1885) he maintained that vaccination is useless and dangerous. Wallace also published an account of what he held to be the greatest discoveries as well as the failures of the 19th century, *The Wonderful Century* (1899). His later works include *Studies, Scientific and Social* (1900), *Man's Place in the Universe* (1903) and his *Autobiography* (1905). Possessed of a bold and intensely original mind, his activities radiated in many directions, apparently rather attracted than repelled by the unpopularity of certain of his theories. The non-theological *Atlantis of the Mind* (1893) has the truest missionary spirit, an intense faith which would seek to move the mountains of apathy and active opposition.

Whatever may be the future history of his other views, he will always be remembered as an originator of a principle more illuminating than any which has appeared since the days of Newton, as one of its two discoverers whose scientific rivalry was only the beginning of a warm and unbroken friendship.

Wallace was married in 1866 to the eldest daughter of the botanist, Mr. William Mitten, of Hurstpierpoint, Sussex. In 1877 he built a house at Grays, Essex, in an old chalk-pit, and after living there four years, moved successively to Dorking (two years) and Croydon (three years). In 1880 he built a cottage at Godalming near the Charterhouse school, and grew nearly 1000 species of plants in the garden which he made. In 1889 he moved to Dorsetshire. After his return to England in 1892 Wallace visited the continent, especially Switzerland, for rest and change (1886, 1896) and the study of botany and glacial phenomena (August 1895). He also visited Spa, in Belgium, about 1870, and in October 1887 went for a lecturing tour in the United States. He delivered a course of six Lowell lectures in Boston, and visited New York, New Haven, Baltimore, &c., spending the winter at Washington. The following March he went to Canada and Niagara, and then made his way westwards. He saw the Yosemite Valley, the Big Trees, and botanized in the Sierra Nevada and at Gray's Peak. In July he returned to Liverpool by way of Chicago and the St. Lawrence.

The first Darwin medal of the Royal Society was awarded to A. R. Wallace in 1895, and he had received the Royal medal in 1868. A pension was awarded him by Mr. Gladstone at the beginning of 1881. He received the degree of D.C.L. from Oxford in 1886, and of LL.D. from the university of Dublin in 1882. He was president of the Entomological Society of London in 1870-1871.

Apart from Wallace's own *Autobiography*, a good deal of useful information is given in the biographical introduction to Wallace's *Mimicry of Travels on the Amazon and Rio Negro* by the editor, Mr. C. T. Bettany.

**WALLACE, Lewis** [Lewis] (1827-1905), American soldier and author, was born at Brookville, Indiana, on the 10th of April 1827, and received an academic education. He abandoned temporarily the study of law in Indianapolis to recruit a company of volunteers (of which he was made second lieutenant) for the Mexican War, and served in 1846-1847 in the First Indiana Battery. He returned to the law, but at the beginning of the Civil War became colonel of the Eleventh Indiana Infantry, served in the West Virginia campaign, and on the 3rd of September 1861 was appointed brigadier-general. After the capture of Fort Donelson (February 16, 1862) he was promoted to major-general (March 21, 1862), was engaged at Shiloh (April, 7, 1862), and afterwards commanded the Eighth Corps.
WALLACE, SIR R.—WALLACE, SIR WILLIAM 277

with headquarters at Baltimore. By delaying the Confederate
general J. A. Early at Monocacy (July 9, 1864) he saved Washing-
ton from almost certain capture. General Wallace served as
president of the court of inquiry (November 1862) which in-
vestigated the conduct of General D. C. Buell, and of the court
which in 1865 tried and condemned Henry Wirz, commander
of the Confederate prison at Andersonville, Ga. He was also
a member of the court which tried the alleged conspirators against
President Lincoln. He resigned from the army in 1865 to
return to the bar. He served as governor of New Mexico Terri-
tory (1878–1881) and was a member of the Council of His Highness
under whose auspices the boy was educated, mainly at Paris;
but it was generally supposed in his lifetime that he was a son
of the fourth marquess (his elder by only eighteen years), and
therefore her grandson. At Paris he was well known in society,
and became an assiduous collector of all sorts of valuable objets
d'art, but in 1857 these were sold and Wallace devoted himself
to assisting the fourth marquess, who left London to reside
entirely in Paris, to acquire a magnificent collection of the
finest examples of painting, armour, furniture and bric-a-brac.
The marquess of Hertford, the last of that line, was a
Frenchman who owned many works of art.

WALLACE, SIR RICHARD, Bart. (1818–1890), English
art collector and philanthropist, was born in London on the
26th of July 1818. According to Sir Walter Armstrong (see
Dict. of National Biography, art. "Wallace"), he was a natural
son of Sir Richard Wallis, 5th bart., of Hertford House, West
Malling, Kent, under whose auspices the boy was educated, mainly at Paris;
but it was generally supposed in his lifetime that he was a son
of the fourth marquess (his elder by only eighteen years), and
therefore her grandson. At Paris he was well known in society,
and became an assiduous collector of all sorts of valuable objets
d'art, but in 1857 these were sold and Wallace devoted himself
to assisting the fourth marquess, who left London to reside
entirely in Paris, to acquire a magnificent collection of the
finest examples of painting, armour, furniture and bric-a-brac.
The marquess of Hertford, the last of that line, was a
Frenchman who owned many works of art.

Wallace was a soldier, an officer, and a governor. He was
also a member of the Council of His Highness under whose auspices the boy was educated, mainly at Paris;
but it was generally supposed in his lifetime that he was a son
of the fourth marquess (his elder by only eighteen years), and
therefore her grandson. At Paris he was well known in society,
and became an assiduous collector of all sorts of valuable objets
d'art, but in 1857 these were sold and Wallace devoted himself
to assisting the fourth marquess, who left London to reside
entirely in Paris, to acquire a magnificent collection of the
finest examples of painting, armour, furniture and bric-a-brac.
The marquess of Hertford, the last of that line, was a
Frenchman who owned many works of art.

WALLACE, SIR WILLIAM (c. 1270–1305), the popular
national hero of Scotland, is believed to have been the second son
of Sir Malcolm Wallace of Elderslie and Auchinbothie, in Ren-
frewshire. The date of his birth is not certainly ascertained,
but is usually given as 1270. The only authority for the events
of his early life is the metrical history of Blind Harry. That
author cannot be implicitly relied on, though we need not conclude
that the minstrel invented the stories he relates. He lived
about two centuries later than Wallace, during which a
considerable body of legend had probably gathered round the
name, and these popular "gestis" he incorporates in his narra-
tive. At the same time he professes to follow as his "autour"
an account that had been written in Latin by John Blair, the
personal friend and chaplain of Wallace himself. As Blair's
account has perished, we cannot tell how far the minstrel has
faithfully followed his authority, but some comparatively recent
discoveries have confirmed the truth of portions of the narrative
which had previously been doubted. At best, however, his
authority must be regarded with suspicion, except when it is
confirmed by other and more trustworthy evidence.

Only for a period of less than two years in his life—from the
beginning of the rising in 1297 to the battle of Falkirk—
does Wallace come before us in the clearest historical light.
With the exception of one or two glimpses of him that we obtain
from authentic historical documents, the recorded events of his
later as of his earlier life rest on no more certain authority than
that of Blind Harry, who was a contemporary of Wallace.

In his boyhood, according to the usual accounts, he resided
for some time at Dunipace, in Stirlingshire, with an uncle, who is
styled "parson" of the place. By this uncle he was partially
educated, and from him he imbibed an enthusiastic love of
liberty. His education was continued at Dundee, where he made
the acquaintance of John Blair. On account of an incident that

WALLACE, SIR R.—WALLACE, SIR WILLIAM 277

happened at Dundee—his slaughter of a young Englishman
named Selby, for an insult offered to him—he is said to have
been outlawed, and so driven into rebellion against the English.

Betting himself to the wilds of the country, he gradually
acquired a body of followers, and formed for himself a
small state. But at the end of a few years he fell a victim to
various attacks upon the English. In consequence of the success
of these early enterprises his following largely increased,
some of the more patriotic nobles—including the steward of Scotland,
Sir Andrew Moray, Sir John de Graham, Douglas the Hardy,
Wishart, bishop of Glasgow, and others—having joined him.

His insurrection now became more open and pronounced, and
his enterprises of greater importance. An attack was made
upon the English justiciar, Ormsby, who was holding his court at
Scone. The justiciar himself escaped, but many of his followers
were captured or slain. The burning of the Barns of Ayr, in the
quarters of English soldiers, in revenge for the treacherous
slaughter of his uncle, Sir Ronald Crawford, and other Scottish
noblemen, followed. The success of these exploits induced the
English king to take measures for staying the insurrection. A
large army, under the command of Sir Henry Percy and Sir
Robert Clifford, was sent against the insurgents, and came up
with them at Irvine. Dissensions broke out among the Scottish
leaders, and all Wallace's titled friends left him and made sub-
mission to Edward, except the ever faithful Sir Andrew Moray.

The treaty of Irvine, by which these Scottish nobles agreed
to yield the river and its sovereignty lord, is printed in
Rymer's Foedera. It is dated the 9th of July 1297, and is the
first public document in which the name of Sir William Wallace
occurs. Wallace retired to the north, and although deserted by
the barons was soon at the head of a large army. The vigour
and success of his operations was such that in a short time he
succeeded in recovering almost all the fortresses held by the
English to the north of the Forth. On the 12th of September 1207, began to cross the bridge. When
about one half of his army had crossed, and while they were still
in disorder, they were attacked with such fury by Wallace, that
almost all—Cressingham among the number—were slain, or
driven into the river and drowned. Those on the south side of
the river being seized with panic and fled tumultuously, having
first set fire to the bridge. The Scots, however, crossed by a ford,
and continued the pursuit of the enemy as far as Berwick.
Sir Andrew Moray fell in this battle. The results of it were
important. The English were everywhere driven from Scotland.
To increase the alarm of the English, as well as to relieve the
famine which then prevailed, Wallace organized a great raid into
the north of England, in the course of which he devastated the
country to the gates of Newcastle. On his return he was elected

WALLACE, SIR R.—WALLACE, SIR WILLIAM 277
WALLACE, W.—WALLACE, W. V.

WALLACE, WILLIAM (1768–1843), Scottish mathematician, was born on the 23rd of September 1768 at Dysart in Fifehire, where he received his school education. In 1784 his family removed to Edinburgh, where he himself was set to learn the trade of a bookbinder; but his taste for mathematics had already developed itself, and he made such use of his leisure hours that before the completion of his apprenticeship he had made considerable acquisitions in geometry, algebra and astronomy. He was further assisted in his studies by John Robison (1739–1804) and John Playfair, to whom his abilities had been known. After the completion of his education, dictated mainly by a desire to gain time for study, he became assistant teacher of mathematics in the academy of Perth in 1794, and this post he exchanged in 1803 for a mathematical mastership in the Royal Military College at Great Marlow (afterwards at Sandhurst). In 1819 he was chosen to succeed John Leslie in the chair of mathematics at Edinburgh, and in 1838, when compelled by ill-health to retire, he received a government pension for life. He died in Edinburgh on the 28th of April 1843.

In his earlier years Wallace was an occasional contributor to Playfair's Mathematical Repository and the Gentleman's Mathematical Collection. Between 1801 and 1810 he edited articles prefixed to MacCulloch's "Account of the Cognizances of Scotland", and several others in mathematical and physical sciences in the fourth edition of the Enyclopedia Britanica, and some of these were retained in subsequent editions from the fifth to the eighth inclusive. He was also one of the authors of the Mathematical and Physical Polarities in the Edinburgh Encyclopaedia, edited by David Brewster (1808–1830). He also contributed many important papers to the Transactions of the Royal Society of Edinburgh.

Transactions of the Royal Soc., 1844.

WALLACE, WILLIAM (1844–1897), Scottish philosopher, was born at Cupar-Fife on the 11th of May 1844, the son of a housebuilder. Between the ages of sixteen and twenty-two he was educated at St Andrews, whence he proceeded as an exhibitor in 1864 to Balliol College, Oxford. He took a first class in Moderations, and in Lit. Hum. (1867), was Gaisford prizeman in 1867 (Greek prose) and Craven Scholar in 1869. Three years later he was appointed fellow, and in 1871 librarian, of Merton College. In 1882 he was elected Whyte's professor of moral philosophy in succession to T. H. Green, and retained the position until his death. He died on the 18th of February 1897 from the effects of a bicycle accident near Oxford. His manner was somewhat brusque and sarcastic, and on this account, in his undergraduate days at Balliol, he was known as "The Dorian." But he was greatly respected both as a man and as a lecturer. His philosophical works are almost entirely devoted to German, and especially to Hegelian, doctrines, which he expounded and criticized with great clearness and literary skill. In dealing with Hegel he was, unlike many other writers, successful in expressing himself in a lucid literary manner, without artificial and incomprehensible terminology.

His principal works were The Logic of Hegel (1873), which contains a translation of the Encyclopädie with an introduction, a second edition of which, with a volume entitled Prolegomena, appeared in 1892; Epicureanism (1880); Kanti (Blackwood's Philosophical Classics, 1882); Life of Arthur Schopenhauer (1890); Hegel's Philosophy of Mind (translated from the Encyclopädie, with five introductory pages); Lectures on Historical and Critical Theology and Ethics, being a selection from his papers edited with a biographical introduction by Edward Caird. He wrote several important articles for the 9th edition of the Encyc. Brit., which, with some revisions, have been repeated in the present work.

WALLACE, WILLIAM VINCENT (1814–1865), British composer, was born at Waterford, Ireland, his father a Scottish family, being a regimental musician. But Wallace learnt as a boy to play several instruments, and became a leading violinist in Dublin. But in 1835 he married and went off to Australia, sheep farming. A concert in Sydney revived his musical passion; and having separated from his wife, he began a roving career, which had many romantic episodes, in Australia, the South Seas, India and South America. He returned to London in 1845 and made various appearances as a pianist; and in November of that year his opera Mariana was performed at Drury Lane with great success. This was followed by Matilda of Hungary (1847), Lurline (1860), The Amber Witch.

For bibliography see the article in the Dict. Nat. Biog. The principal modern lives are James Moir's (1866), and A. F. Morrison's (1898).

A. F. H.

Wallace, his Lectures

He first

(A. H.)

Wednesday, when the news of this successful revolt reached him. He hastened home, and at the head of a great army entered Scotland in July 1298. Wallace was obliged to adopt the only plan of campaign which could give any hope of success. He slowly retired before the English monarch, driving off supplies and wasting the country. The nobles as usual for the first part paid little regard to his standard. Those that remained thwarted his councils by their jealousies. His plan, however, came very near being successful. Edward, compelled by famine, had already given orders for a retreat when he received information of Wallace's position and intentions. The army, then at Kirkliston, was immediately set in motion, and next morning (July 22, 1298) Wallace was brought to battle in the vicinity of Falkirk. After an obstinate fight the Scots were overpowered and defeated with great loss. Among the slain was Sir John de Graham, the bosom friend of Wallace, who went to his death, and among the French, he threw his head into a frenzy of rage and grief. The account of his distress is one of the finest and most touching passages in the poem. With the remains of his army Wallace found refuge for the night in the Torwood—known to him from his boyish life at Dunipace. He then retreated to the north, burning the town and castle of Stirling on his way. He resigned the office of guardship, and betook himself again to a wandering life and a desultory and predatory warfare against the English. At this point his history again becomes obscure. He is known to have paid a visit to France, with the purpose of obtaining aid for his country from the French king. This visit is narrated with many untrustworthy details by Blind Harry; but the fact is established by other and indisputable evidence. When in the winter of 1302–1303 Edward received the submission of the Scottish nobles, Wallace was expressly excepted from all terms. And after the capture of Stirling Castle and Sir William Oliphant, and the submission of Sir Simon Fraser, he was left alone, but resolute as ever in refusing allegiance to the English king. A price was set upon his head, and the English governors and captains in Scotland had orders to use every means for his capture. On the 6th of August 1305 he was taken—as is generally alleged, through treachery—at Robroyston, near Glasgow, by Sir John Menteith, carried to the castle of Dumbarton, and thence conveyed in fetters and strongly guarded to London. He reached London on the 22nd of August, and next day was taken to Westminster Hall, where he was impeached as a traitor by Sir Peter Mallorie, the king's justice. To the accusation Wallace made the simple reply that he could not be a traitor to the king of England, for he never was his subject, and never swore fealty to him. He was found guilty and condemned to death. The sentence was executed the same day with circumstances of unusual cruelty.

The cause of national independence was not lost with the life of Wallace. Notwithstanding the cruelty and indignity amid which it terminated, that life was not a failure. It has been an inspiration to his countrymen ever since. The popular ideas regarding his stature, strength, bodily prowess and undaunted courage are confirmed by the writers nearest his own time—Wytoun and Fordun. And indeed no man could in that age have secured the personal ascendency which he did without the possession of these qualities. The little we know of his statesmanship during the short period he was in power gives proof of political wisdom. His patriotism was conspicuous and disinterested. He was well skilled in the modes of warfare that suited the country and the times. That he failed in freeing his country from the yoke of England was due chiefly to the jealousy with which he was regarded by the men of rank and power. But he had a nobler success in inspiring his countrymen with a spirit which made their ultimate conquest impossible.
WALLACK—WALL-COVERINGS

WALLACK, a city and the county-seat of Walla Walla county, Washington, U.S.A., in the S.E. part of the state, on Mill Creek, about 300 m.s. by W. of Spokane. Pop. (1880) 3588; (1890) 4790; (1900) 10,040, of whom 1522 were foreign-born; (1910 census) 19,364. Walla Walla is served by the Northern Pacific and the Oregon Railroad & Navigation Co.'s (Union Pacific) railways, and by an interurban electric line. In the city are a state penitentiary, Fort Walla Walla (a U.S. cavalry post), a Federal Land Office, a Young Men's Christian Association building, a Carnegie library, the State Odd Fellows' Home, and the Stubbfield Home for Widows and Orphans. Sessions of Federal District and Circuit courts are held here.

WALLACETOWN is the site of the Cheshire College (chartered 1859; opened, 1866; rechartered, 1883), originally a Congregational, but now non-sectarian, which was founded by the Rev. Cushing Eells and was named in honor of Marcus Whitman, and includes a college, a conservatory of music and a preparatory academy, and occupies a campus of 30 acres; and of Walla Walla College (Adventist). Here are also St Paul's School (Protestant Episcopal) for girls, and St Vincent's Academy for girls and De La Salle Academy for boys (both Roman Catholic). The city is situated in a farming (especially wheat-growing), stock-raising and fruit-growing region, is a distributing centre for the adjacent territory and is a transit point between the Pacific railway and the Columbia river.

Wallace is a large town of the first order, situated on a high plain, about 2 m. by N.W. of the town of Rockford, in Sangamon county, Illinois. It is the seat of a court of chancery and of a school district. Pop. (1880) 3834; (1890) 7164; (1900) 4030; (1910) 7881.

WALLACETOWN, WALLAROO, WALLASS, WALLATROSS, WALLAS, WALLASEY, WALLING, WALLINGFORD, WALLINGFTON, WALLLACEMAN, WALLOR, WALLower, WALLPARK, WALLPORT, WALLSTONE, WALL-WALKING.

WALLACETOWN, a seaport of Daly county, South Australia, situated in Wallarooy, on the Spencer Gulf, 123 m. by r. N.W. by N. of Adelaide. It is connected by r. with the celebrated Wallaroo copper mines (near Kadina, at a distance of 6 m. from the port). At Wallaroo Bay are the largest smelting works in the state, ranking among the largest in the world. Copper ores are received from other parts of the continent and from Tasmania for smelting at these works, which have ample facilities for shipment. Population of town (1901) 2920; of town and mines, 4866.

WALLASEY, an urban district in the Wirral parliamentary division of Cheshire, England, 2 m. N.W. of Birkenhead, of which it forms a suburb. Pop. (1901) 33,370. The former manor estuary called Wallasey Pool is occupied by the Great Float, forming an immense dock (see BIRKENHEAD). The church of St Hilary, to which is assigned a foundation in the 10th century, was rebuilt in the 15th century, with the exception of the tower bearing the date 1516. It was gutted by fire in 1857, and the whole was again rebuilt in the Early English style. On the shore of the Irish Sea is Leasowe Castle, once known as Mock-Beggar Wall, and supposed to have been erected by the earls of Derby in the reign of Elizabeth, in order to witness the horse-races held here. Under Wallasey Pool are remains of a submerged forest, in which various animal skeletons have been found.

At the Conquest Wallasey formed part of the possessions of Robert de Rhuddlan, and on his death it became part of the manor of Halton. In the reign of Elizabeth it had a small port, to which there belonged three barques and fourteen men. In 1668 the manor was possessed by the earl of Derby, but various parts afterwards became alienated. For a considerable time the horse-races held on what was then a common had considerable reputation, but they were discontinued in 1750. At these races the duke of Monmouth, son of Charles II., once rode his own horse and won the plate.

WALLACE, WALL-COVERINGS. The present article deals with this subject (see MURAL DECORATION for art and archaeology) from the practical point of view in connexion with house-furnishing. In selecting a wall-covering, the chief factors to be borne in mind are the conditions of the room, viz., the use to which it is to be put, and its lighting, aspect and outlook.

Marble is one of the most beautiful materials that can be chosen for covering walls. The many fine veins and the almost infinite variety of color give a wide choice that enables it to be employed in practically any scheme of colouring and for rooms of any aspect and any description. The working up of the marble is done mostly by machinery; the saws used are flat strips of steel set in the frame of a machine and worked to and fro, sand and water being constantly supplied to assist in the work of cutting. Marbles are worked to the desired profile by rapidly revolving carbonium wheels, and are afterwards polished by hand. Marble-wall-skimming needs very careful fixing, and should be well supported by a sufficient number of cramps at a little distance from the wall, leaving a space of about 1 in. at the top of the marble. No rusting cramps should be used, such as those made of copper or bronze. A cement made of plaster of Paris and marble dust mixed in the proportion of two parts to one should be used for fixing, as pure plaster, especially if new, is liable to swell and cause the marble to crack. Maresco and Scagliola are imitation marbles and are described in PLASTERWORK.

Marble, well-dressed and properly executed mosaic is a very beautiful decorative medium, and ranks among the most permanent as well as most pleasing wall-coverings. With glass mosaic great ranges both of colour and of texture of surface can be obtained, different methods giving the glass a brilliant granular or quite dull surface as desired to suit the particular position of the work. Marble mosaic is used more for floors and pavings than for vertical surfaces. Most mosaic is now put together in the studio and plastered upon sheets of tough paper, to which the design has previously been transferred. The whole section can thus be bedded on the prepared wall-surface with the least amount of
WALLENSTEIN, A. E.

Tiling.

The most valuable qualities of being hard in wear, durable, free from dust and dirt, and easily washable, with beauty of design, colouring and surface, tiling may perhaps be placed next in order of merit as a wall-covering to wallpaper, although the high price of good quality, glazed, and various trade names, is now much used, especially for tiling existing walls. It has all the sanitary qualities of tiles, but is perhaps somewhat more fragile and liable to be damaged under hard wear. It is easy to prepare either colours and is usually fixed with a special cement or mastic which allows for slight movements of expansion and contraction. The thickness of the material varies with the kind of tiling used.

Metal sheeting, though somewhat inartistic in appearance, is useful where a durable, waterproof and sanitary wall protection is needed, and is therefore often used for sculleries, wash-houses and lavatories. This sheet of zinc with slightly embossed patterns and enamelled in colours can be hung upon the wall with a composition of white lead (one part) and whiting (two parts) mixed to a thick paste with varnish or oil colour. Sheets of iron or steel. The design of the paper, of which a design is fixed to the wall with nails or screws; they are either previously enamelled or are painted after being fixed. They are used more for ceilings than for wall-coverings, but are adapted for use in either position.

Tapestry paper. Some of the best known fragments is a most beautiful wall-covering. It is usually hung upon frames fitted to the wall.

Tapestry, and may either cover the entire wall surface or be fixed in certain sections, panels, friezes or pilasters. They are used at all a sanitary covering, for it harbours a very large quantity of dust and dirt. The same remark applies, but perhaps in a less degree, to brocades of silk and damask. These materials are of a delicate nature and become soiled by dust. An alternative usage of good qualities, papered or tiled, is a most admirable wall-covering, which will stand hard wear, and it forms a good background for pictures and furniture.

Metal sheeting.

The term "wall-paper" embraces a very large variety of materials of many kinds and qualities, usually machine-printed papers of the most flimsy description and often hideous design, to the Japanese and similar leathery papers, skillfully modelled in relief and richly decorated in gold and colours.

Wall-papers may be either in distemper colours or oil colours, and the patterns upon them are printed either by hand or by machine. There are also self-coloured papers which have different kinds of surface finish, and with some of these a pattern is formed by contrasting a smooth with a roughened number, or by offset printing, plane surface, and no attempt made to introduce a pictorial element into the decoration. The wall-paper, regarded from the paper-hanger's point of view, is often divided into three sections, the dado or under wall, the frieze, and the wall, or the top surface beneath the cornice. This subdivision is not always adhered to, and a wall may be papered uniformly all over its surface, or may consist of one section only, either the dado without the frieze, or frieze and filling without the dado. The division between the sections is usually formed, in the case of the frieze and filling, with a wood picture, and between the filling and dado with a moulded dado or chair rail.

Wall-papers may be printed either in distemper colours or oil colours, and the patterns upon them are printed either by hand or by machine. There are also self-coloured papers which have different kinds of surface finish, and with some of these a pattern is formed by contrasting a smooth with a roughened number, or by offset printing, plane surface, and no attempt made to introduce a pictorial element into the decoration. The wall-paper, regarded from the paper-hanger's point of view, is often divided into three sections, the dado or under wall, the frieze, and the wall, or the top surface beneath the cornice. This subdivision is not always adhered to, and a wall may be papered uniformly all over its surface, or may consist of one section only, either the dado without the frieze, or frieze and filling without the dado. The division between the sections is usually formed, in the case of the frieze and filling, with a wood picture, and between the filling and dado with a moulded dado or chair rail.

The best papers are printed from blocks manipulated by hand. The pattern, or as much of it as is to be printed in one colour, is carefully composed on the wood block, small and delicate members being represented by strips of hack work, inverted in the manner of woodcut work. With large blocks a trowel and pulley arrangement gives the workman assistance in applying and removing the pattern, which is first fixed upon the wall, and then washed over with a watered-down paste, and then applied to the surface of the paper to be decorated. One tint is applied at a time, and this when dry is followed by others necessary to complete the design. This drying of the previous colour ensures sharpness of outline and accuracy of colour. Designs are sometimes worked on the paper with special patterns cut out of zinc sheets. These are laid upon the paper and thick colour applied through the perforations with a stiff brush.

The cheaper wall-papers are printed by machinery. The paper is fed through red hot rollers, large dies are adopted, and are grouped to the printing cyliners, each with a separate ink colour, to give the special colour for its use. On each of the wooden printing rollers is set copper "type," representing as much of the pattern as is to be printed, and the various designs and the work of the roller is one piece to form one perfect pattern, and when printing in several colours it may take a skilled workman a week or more to "set" his machine, a very large quantity of paper being applied in a single day.

The colours used for hand-printed work, whether applied with blocks or stencil plates, are much thicker in consistency than those for machine print work. The advantage of hand-worked paper is the comparative ease with which the paper can be removed if it has gone out of stock. At a slight extra cost the manufacturer will print a few pieces for his customer from the blocks he has retained. With machine-printed work, however, the colouring of the paper, to ascertain the number of pieces required for a room, is made by taking a tracing in ten or fifteen copies, stained with different tints, and these figures representing in print the area of the design, and the amount of material required; an allowance of about one-seventh must be added to allow for wastage in matching patterns and odd lengths. If French papers are to be used the division should be 38 instead of 60, these figures representing the number of bands in the printed surface in each roll. The surface of the wall should before papering be carefully prepared so as to be quite smooth and regular. The paper that has been previously peeled should be stripped, and any irregularities filled in with stopping. To remove varnished paper use hot water to which borax has been added in the proportions of 2 oz. to each pint of water. In selecting a paper for a newly plastered wall, it is advisable to have the plaster sustaining the blunting action of the lime in the plaster. Greens, blues and pinks especially are affected in this manner. For heavy papers glue paste should be used. Papering which has become dirty may be effectually cleaned with a trowel made from the handle of a scullery mop, the blade being cut to a wedge shape in one direction this speedily removes the dirt. When the wall is damp, tinfoil, pitch-covered paper or Willesden waterproofed paper is used behind the paper to prevent the paper from becoming damaged by the water. For a piece of paper 12 yds. long and 21 in. wide. The printed surface is only 20 in. in width, as a margin of half an inch is left on each edge. One or both of these plain margins must be removed prior to hanging. French wall-papers are 9 yds. long and 18 in. wide, and only 17 in. of this is a useful piece of English paper. To ascertain the number of pieces required for a room take the superficies in feet of the surface to be covered (dado, frieze, and pilasters) and divide by 240. This gives the net amount required; an allowance of about one-seventh must be added to allow for wastage in matching patterns and odd lengths. If French papers are to be used the division should be 38 instead of 60, these figures representing the number of bands in the printed surface in each roll. The surface of the wall should before papering be carefully prepared so as to be quite smooth and regular. The paper that has been previously peeled should be stripped, and any irregularities filled in with stopping. When the wall is damp, tinfoil, pitch-covered paper or Willesden waterproofed paper is used behind the paper to prevent the paper from becoming damaged by the water.

WALLENSTEIN (properly WALLENSTEIN), ALBRECHT WENZEL EUSEBIUS VON, duke of Friedland, Sagan and Mecklenburg (1583-1634). German soldier and statesman, was born of a noble but by no means wealthy or influential family at Herrnack, Bohemia, on the 15th of September 1583. His parents were Lutherans, and in early youth he attended the school of the Brothers of the Common Life at Koschumberg. After the death of his parents he was sent by his uncle, Slawa, to the Jesuit college of nobles at Olmitz, after which he professed, but hardly accepted, the Roman Catholic faith. In 1600 he went to the university of Altdorf, at which he had to leave in consequence of some boisterous fellows. Afterwards he studied at Bologna and Padua, and visited many places in southern and western Europe. While in Padua he gave much attention to astrology, and during the rest of his life he never wavered in the conviction that he might trust to the stars for indications as to his destiny. For some time Wallenstein served in the army of the emperor Rudolph II. in Hungary, which was commanded by a methodical professional soldier, Giorgio Basta. His personal gallantry at the siege of Gran won for him a company without promotion. In 1606 he returned to his estates, but in 1609 he married an elderly widow, Lucretia Nikossie von Landeck, whose great estates in Moravia he inherited after her death in 1614. His new wealth enabled him to offer two hundred horse, splendidly equipped, to the archduke Ferdinand for his war with Venice in 1617. Wallenstein commanded them in person, and from that time he enjoyed both favour at court and popularity in the army. His wealth and influence were further increased by his marriage with Isabella Katharina, daughter of Count Harrach, a confidential adviser of the emperor Matthias. In the disturbances which broke out in Bohemia in 1618 and proved to be the beginning of the Thirty Years' War, advances
WALLENSTEIN, A. E.

were made to Wallenstein by the revolutionary party; but he preferred to associate himself with the imperial cause, and he carried off the treasure-chest of the Moravian estates to Vienna, part of its contents being given him for the equipment of a regiment of cuirassiers. At the head of this regiment Wallenstein won great distinction under Buquoy in the war against Mansfield. He was not present at the battle of the Weisser Berg, but he did help the same time to the imperial cause, in opposition to Gabriel Bethlen in Moravia, and recovered his estates which the nationalists had seized. The battle of the Weisser Berg placed Bohemia at the mercy of the emperor Ferdinand, and Wallenstein turned the prevailing confusion to his own advantage. He secured the great estates belonging to his mother's family, and the emperor sold to him on easy terms vast tracts of confiscated lands. His possessions he was allowed to form into a territory called Friedland, and he was raised in 1622 to the rank of an imperial count palatine, in 1623 to that of a prince. In 1625 he was made duke of Friedland. Meantime he fought with skill and success against Gabriel Bethlen, and so enhanced his reputation at the dark moment when Vienna was in peril and the emperor's general Buquoy dead on the field of battle. At this stage in his life the enigma of his personality is complicated by the fact that he was not only the cold, detached visionary with vast ambitions and dreams, but also the model ruler of his principality. In everyday matters of administration he displayed vigour and foresight. He not only placed the administration of justice on a farm basis and founded schools, but by many wise measures developed agriculture and mining and manufacturing industries. At the same time he collected in the service of his ambition and his authority a pomp and refinement in his court which contrasted forcibly with the way of life of the smaller established rulers.

When the war against the Bohemians had become a widespread conflagration, Ferdinand found he had no forces to oppose to the Danes and the Northern Protestants other than the Army of the League, which was not his, but the powerful and independent Maximilian's, instrument. Wallenstein saw his opportunity and early in 1626 he offered to raise not a regiment or two, but a whole army for the imperial service. After some negotiations the offer was accepted, the understanding being that the troops were to be maintained at the cost of the countries they might occupy. Wallenstein's popularity soon brought great numbers of recruits to his standard. He soon found himself at the head of 30,000 (not long afterwards of 50,000) men. The campaigns of this army in 1625, 1626 and 1627, against Mansfield, the Northern Protestants and Gabriel Bethlen, are described under Thirty Years' War.

Having established himself in Hungary, Wallenstein proceeded, in 1627, to clear Silesia of some remnants of Mansfield's army; and at this time he bought from the emperor the duchy of Sagan, his outlay in the conduct of the war being taken into account in the conclusion of the bargain. He then joined Tilly in the struggle with Christian IV., and afterwards took possession of the duchy of Mecklenburg, which was granted to him in reward for his services, the hereditary dukes being displaced on the ground that they had helped the Danish king. He failed to capture Stralsund, which he besieged for several months in 1628. This important reverse caused him bitter disappointment, for he had hoped that by obtaining free access to the Baltic he might be able to make the emperor supreme at sea as he seemed to be on land. It was a part of Wallenstein's scheme of German unity that he should obtain possession of the Hanseatic towns, and through them destroy or at least defy the naval power of the Scandinavian kingdom, the Netherlands and England. This plan was completely frustrated by the resistance of Stralsund, and even more by the emperor's "Edict of Restitution" that not only rallied against him all the Protestants but brought in a great soldier and a model army, Gustavus and the Swedes.

At the time of the victory of the Peace of Lutzen Wallenstein took part in the victory of the Peace of the League involved the fall of Wallenstein's influence. By his ambitions, his high dreams of unity and the incessant exactions of his army, he had made for himself a host of enemies. He was reported to have spoken of the arrogance of the princes, and it appeared probable that he would try to bring them, Catholics and Protestants alike, into rigid subjection to the crown. Again and again the emperor was advised to dismiss him. Ferdinand was very unwilling to part with one who had served him so well; but the demand was pressed so urgently in 1630 that he had no alternative, and in September of that year envoys were sent to Wallenstein to announce his recall. Had the emperor declined to take this course, the princes would probably have combined against him; and the result would have been a civil war even more serious than that which had already brought so many disasters upon the country. Wallenstein perfectly understood this, and he therefore accepted the emperor's decision calmly, gave over his army to Tilly, and retired to Gitschin, the capital of his duchy of Friedland. There, and at his palace in Prague, he lived in an atmosphere of mysterious magnificence, the rumours of which penetrated all Germany. The enigma of his projects was intensified, and the princes who had incurred his disgrace became more suspicious than ever. But ere long the emperor was forced by events to call him into the field again.

Shortly before the dismissal of Wallenstein, Gustavus Adolphus had landed in Germany, and it soon became obvious that he was far more formidable than the enemies with whom the emperor had yet had to contend. Tilly was defeated at Breitenfeld and on the Lech, where he received a mortal wound, and Gustavus advanced to Munich, while Bohemia was occupied by his allies the Saxons. The emperor entreated Wallenstein to come once more to his aid. Wallenstein at first declined; he had, indeed, been secretely negotiating with Gustavus Adolphus, in the hope of destroying the League and its projects and of building his new Germany without French assistance. However, he accepted Ferdinand's offers, and in the spring of 1632 he raised a fresh army as strong as the first within a few weeks and took the field. This army was placed absolutely under his control, so that he assumed the position of an independent prince rather than of a subject. His first aim was to drive the Saxons from Bohemia— an object which he accomplished without serious difficulty. Then he advanced against Gustavus Adolphus, whom he opposed near Nuremberg and after the battle of the Alte Veste dislodged. In November came the great battle of Lützen (q.e.), in which the imperialists were defeated, but Gustavus Adolphus was killed.

To the dismay of Ferdinand, Wallenstein made no use of the opportunity provided for him by the death of the Swedish king, but withdrew to winter quarters in Bohemia. In the campaign of 1633 much astonishment was caused by his apparent unwillingness to attack the enemy. He was in fact preparing to desert the emperor. In the war against the Saxons he had offered them as terms of peace the reoccupation of the Edict. Religious toleration, and the destruction of the separatist régime, as well as not inconsiderable aggressiandments for his own power, formed his programme, so far as historians have been able to reconstruct it, and becoming convinced from Ferdinand's obstinacy that the Edict would never be rescinded, he began to prepare to "force a just peace on the emperor in the interests of united Germany." With this object he entered into negotiations with Saxony, Brandenburg, Sweden and France. He had vast and vague schemes for the reorganization of the entire constitutional system of the empire, and he himself was to have supreme authority in determining the political destinies of his country. But as the mere commander of mercenaries he was trusted by no one, and could only play the part of Cassandra to the end.

Irritated by the distrust excited by his proposals, and anxious to make his power felt, he at last assumed the offensive against the Swedes and Saxons, winning his last victory at Steinau on the Oder in October. He then resumed the negotiations. In December he retired with his army to Bohemia, fixing his headquarters at Pilsen. It had soon been suspected in Vienna that Wallenstein was playing a double part, and the emperor, encouraged by the Spaniards at his court, anxiously sought for means of getting rid of him. Wallenstein was well aware of the designs formed against him, but displayed little energy in his
attempts to thwart them. This was due in part, no doubt, to ill-health, in part to the fact that he trusted to the assurances of his astrologer, Battista Seni. He also felt confident that when the time came for his army to decide between him and the emperor the decision would be in his own favour.

His principal officers assembled around him at a banquet on the 20th January 1634, when he submitted them a declaration to the effect that they should remain true to him. This declaration they signed. More than a month later a second paper was signed; but on this occasion the officers' expression of loyalty to their general was associated with an equally emphatic expression of loyalty to their emperor. By this time Wallenstein had learned that he must act warily. On the 24th of January the emperor had signed a secret patent removing him from his command, and imperial agents had been busying themselves to undermine Wallenstein's influence.

On the 7th of two of his officers, Piccolomini and Aldringen, had intended to seize him at Pilsen; but finding the troops there loyal to their general, they had kept quiet. But a patent charging Wallenstein and two of his officers with high treason, and naming the generals who were to assume the supreme command of the army, was signed on the 18th of February, and published in Prague.

When Wallenstein heard of the publication of this patent and of the refusal of the garrison of Prague to take his orders, he realized the full extent of his danger, and on the 23rd of February, accompanied by his most intimate friends, and guarded by about 1000 men, he went from Pilsen to Eger, hoping to see the Duke of Burghausen, Emperor, at whom, it is supposed, of his sincerity, were marching to join him. After the arrival of the party at Eger, Colonel Gordon, the commandant, and Colonels Butler and Leslie agreed torid the emperor of his enemy. On the evening of the 25th of February Wallenstein's supporters Illo, Kinsky, Terzky and Neumann were received at a banquet by the three colonels, and then murdered. Butler, Captain Devereux and a number of soldiers hurried to the house where Wallenstein was staying, and broke into his room. He was instantly killed by a thrust of Devereux's pistol. Wallenstein was buried at Gitschin, but in 1732 the remains were removed to the castle Chapel of Münchengratz.

No direct orders for the murder had been issued, but it was well understood that tidings of his death would be welcome at court. The murderers were handsomely rewarded, and their deed was commended as an act of justice.

Wallenstein was tall, thin and pale, with reddish hair, and eyes of remarkable brilliancy. He was of a proud and imperious temper, and had a sharp tongue. During his hard and starry days, and at times of supreme difficulty he listened carefully to the advice of his counsellors, but the final decision was always his own, and he rarely revealed his thoughts until the moment for action arrived. Few generals have surpassed him in the power of quickly organizing great masses of men and of inspiring them with confidence and enthusiasm. But it is as a statesman that Wallenstein is immortal. However much or little motives of personal aggrandisement influenced his schemes and his conduct, "Germany turns ever to Wallenstein as she turns to no other amongst the leaders of the Thirty Years' War. . . . Such faithfulness is not without reason. . . . Wallenstein's wildest schemes, impossible of execution by military violence, were always built upon the foundation of German unity. In the way in which he walked that unity was doubtless unattainable. . . . But during the long dreary years of confusion which were to come, it was as nothing to those of the last supremely able man whose life had been spent in battling against the great evils of the land, against the spirit of religious intolerance and the spirit of cruelty."

WALLER, EDMUND (1666-1687), English poet, was the eldest son of Robert Waller of Coleshill (then in Herts, now in Buckingham county) and Anne Hargrave, his wife. He was his maternal cousin to the celebrated poet John Hampden. He was born on the 4th of March 1666, and baptized in the parish church of Amersham. Early in his childhood his father sold his house at Coleshill and migrated to Beaconsfield. Of Waller's early education all we know is his own account that he "was bred under several ill, dull and ignorant schoolmasters, till he went to Mr Dobson at Wickham, who was a good schoolmaster and had been an Eton scholar." His father died in 1616, and the future poet's mother, a lady of rare force of character, sent him to Eton and to Cambridge. He was admitted a fellow-commoner of King's College on the 22nd of March 1620. He had not yet attained the proper age, and it is believed that in 1621, at the age of only sixteen, he sat as member for Agmonedsham (Amersham) in the last parliament of James I. Clarendon says that Waller was "nursed in parliaments." In that of 1624 he represented Ilchester, and in the first of Charles I. Chipping Wycombe. The first act by which Waller distinguished himself, however, was his surreptitious marriage with a wealthy ward of the Court of Aldermen, in 1631.

He was married before the Star Chamber for this offence, and heavily fined. But his own fortune was large, and all his life Waller was a wealthy man. After bearing a son and a daughter at Beaconsfield, Mrs Waller died in 1634. It was about this time that the poet was elected into Falkland's "Club."

It is supposed that about 1635 he met Lady Dorothy Sidney, eldest daughter of the Earl of Leicester, who was then eighteen years of age. He formed a romantic passion for this girl, whom he celebrated under the name of Sacharissa. She rejected him, and married Lord Spencer in 1639. Disappointment, it is said, rendered Waller for a time insane, but this may well be doubted. He wrote, at all events, a long, graceful and eminently romantic poem, the "Disappointment," which was first published in 1643.

In 1640 Waller was once more M.P. for Amersham, and made certain speeches which attracted wide attention; later, in the Long Parliament, he represented St Ives. Waller had hitherto supported the party of Pym, but he now left him for the group of Falkland and Hyde. His speeches were much admired, and were separately printed; they are academic exercises very carefully prepared. Clarendon says that Waller spoke "upon all occasions with great sharpness and freedom." An extraordinary and obscure conspiracy against Parliament, in favour of the king, which is known as "Waller's Plot," occupied the spring of 1643, but on the 30th of May he and his friends were arrested. In the terror of discovery, Waller was accused of displaying a very mean politeness, and of confessing "whatever he had said, heard, thought or seen, and all that he knew . . . or suspected of others." He certainly cut a poor figure by the side of those of his companions who died for their opinions. Waller was called before the bar of the House in July, and made an abject speech of recantation. His life was spared and he was committed to the Tower, whence, on paying a fine of £10,000, he was released and banished the realm in November 1643. He married a second wife, Mary Bracey of Thame, and went over to Calais, afterwards taking up his residence at Rouen. In 1645 the Poems of Waller were first published in London, in three different editions; there has been much discussion of the order and respective authority of these issues, but nothing is decidedly known. Many of the lyrics were already set to music by Henry Lawes. In 1646 Waller travelled with Evelyn in Switzerland and Italy. During the worst period of the exile Waller managed to get a table for the Royalists in Paris, although in order to do so he was obliged to sell his wife's jewels. At the close of 1651 the House of Commons revoked Waller's sentence of banishment, and he was allowed to return to Beaconsfield, where he lived very quietly until the Restoration.

In 1655 he published A Panegyric to my Lord Protector, and was made a Commissioner for Trade a month or two later. He followed this up, in 1660, by a poem To the King, upon his Majesty's Happy Return. Being challenged by Charles II. to explain why this latter piece was inferior to the eulogy of Cromwell, the poet smartly replied, "Sir, we poets never succeed so well in writing truth as in fiction." He entered the House of Commons in 1661 as M.P. for Hastings, and Burrowes has recorded that for the next quarter of a century "it was no house if Waller was not there." His sympathies were tolerant and kindly, and he constantly defended the Nonconformists. One
famous speech of Waller’s was: “Let us look to our Government, fleet and trade, ‘tis the best advice the oldest Parliament man among you can give you, and so God bless you.” After the death of his second wife, in 1677, Waller retired to his house called Hall Barn at Beaconsfield, and though he returned to London, he became more and more attached to the retirement of his woods, “where,” he said, “he found the trees as bare and withered as himself.” In 1661 he had published his poem, *St James’ Park*; in 1664 he had collected his poetical works; in 1666 appeared his *Instructions to a Painter*; and in 1685 his *Divine Poems*. The final collection of his works is dated 1686, but there were further posthumous additions made in 1690. Waller bought a cottage at Coleshill, where he was born, meaning to die there; “a stag,” he said, “when he is hunted, and near spent, always returns home.” He actually died, however, at Hall Barn, with his children and his grandchildren about him, on the 21st of October 1687, and was buried in woolen (in spite of his expressed wish), in the churchyard of Beaconsfield.

Waller’s lyrics were at one time admired to excess, but with the exception of “Go, lovely Rose” and one or two others, they have greatly lost their charm. He was almost destitute of imaginative invention, and his fancy was plain and trite. But he resolutely placed himself in the forefront of reaction against the violence and “conceit” into which the baser kind of English poetry was descending. A great deal of discussion, some of it absurdly violent in tone, has been expended on the question how far Waller was or was not the pioneer in introducing in English verse a plain and direct style. It is, of course, obvious that Waller could not have introduced what had been invented, and admirably exemplified, by Chaucer. But those who have pointed to smooth distichs employed by poets earlier than Waller have not given sufficient attention to the fact (exaggerated, doubtless, by critics arguing in the opposite camp) that it was he who earliest made writing in the serried couplet the habit and the fashion. Waller was writing in the regular heroic measure, accordingly to his own perfect taste and his own fashion in the medium of the English language. He was a careful, though not a too critical, reader, and his understanding of the bard was admirable, as is shown by his careful study of the works of Shakespeare. He reappeared in the memorable production of Henry V., and he had a great success with *Monsieur Boucau* and similar plays. His wife, Mrs Lewis Waller (Florence West), also became well known as a powerful and accomplished actress.

WALLER, LEWIS (1597–1668), English soldier, was born in Spain, his father being a civil engineer. He first appeared on the London stage in 1683, at Toole’s, and for some years added to his reputation as a capable actor in London and the provinces. He came more particularly to the front by a fine performance as Buckingham in *The Three Musketeers* under Mr Beavobohm Tree’s management at His Majesty’s in 1883, and soon afterwards organized a company of his own, first at the Haymarket and afterwards at Drury Lane. He was a soldier of Imperial, Apollo and other theatres. His fine voice and vigorous acting at the Court were well suited in his memorable production of Henry V., and he had a great success with *Monsieur Boucau* and similar plays. His wife, Mrs Lewis Waller (Florence West), also became well known as a powerful and accomplished actress.

WALLER, SIR WILLIAM (c. 1597–1668), English soldier, was the son of Thomas Waller, lieutenant of Dover, and was born about 1597. He was educated at Magdalen Hall, Oxford, and served in the Venetian army and in the Thirty Years’ War. He was knighted in 1622 after taking part in Vere’s expedition to the Palatinate. Little is known of his life up to 1640, when he became member of parliament for Andover. Being a strict Presbyterian by religion, and a member of the opposition in politics, he naturally threw himself with the greatest ardour into the cause of the parliament when the Civil War broke out in 1642. He was at once made a colonel, and conducted to a speedy and successful issue the siege of Portsmouth in September; and later in the year captured Farnham, Winchester and other places in the south-west. At the beginning of 1643 Waller was made a major-general and placed in charge of operations in the north and west. He took the city of York (see GREAT REBELLION), and he concluded his first campaign with a victory at Higham and the capture of Hereford. He was then called upon to oppose the advance of Sir Ralph Hopton and the Royalist western army, and though more or less defeated in the hard-fought battle of Lansdown (near Bath) he shut up the enemy in Devizes. However, Hopton and a relieving force from Oxford inflicted a crushing defeat upon Waller’s army at Roundway Down. Hopton was Waller’s intimate personal friend, and some correspondence passed between the opposing generals, a quotation from which (Gardiner, *Civil War* i. 1643, is given as illustrative of the temper in which the nobler spirits on either side had entered on the war) “That great God,” wrote Waller, “who is the searcher of my heart knows with what a sad sense I go upon this service, and with what a perfect hatred I detest this war without an enemy; but I look upon it as sent from God . . . God . . . in his good time send us the blessing of peace and in the meantime assist us to receive it! We are both upon the stage and must act such parts as are assigned us in this tragedy, let us do it in a way of honour and without personal animosities.”

The destruction of his army at Roundway Down greatly affected Waller’s military reputation, many reproaching Essex, the commander-in-chief, for allowing the Oxford royalists to turn against Waller. The Londoners, who had called him “William the Conqueror,” recognized his skill and energy so far as willingly to raise a new army for him in London and the south-eastern counties. But from this point Waller’s career is one of gradual disillusionment. His new forces were distinctively local, and, like other local troops on both sides, resented long marches and hard work far from their own counties. Only at moments of imminent danger could they be trusted to do their duty. At ordinary engagements, e.g., when they were defended by their own forts and had mutinied in face of the enemy, deserted and even marched home in formed bodies under their own officers, and their gallantry at critical moments, such as the surprise of Alton in December 1643 and the recapture of Arundel in January 1644, but partially redeemed their general bad conduct. Waller himself, a general of the highest skill,—“the best shifter and chooser of ground” on either side,—was, like Turenne, at his best at the head of a small and highly-disciplined regular army. Only a Cédes or a Cromwell could have enforced discipline and soldierly spirit in such men, ill-clad and unpaid as they were, and the only military quality lacking to Waller was precisely his supreme personal magnetism. In these circumstances affairs went from bad to worse. Though successful in stopping Hopton’s second advance at Cheriton (March 1644), he was defeated by Charles I. in the war of manoeuvre which ended with the action of Cropredy Bridge (June), and in the second battle of Newbury in October his tactical success at the village of Speen led to nothing. His last expeditions were made into the west for the relief of Taunton, and in these he had Cromwell as his lieutenant-general. By this time the confusion in all the armed forces of the parliament had become so great that reforms were essential. The original suggestion of the celebrated “New Model” army came from Waller, who wrote to the Committee of Both Kingdoms (July 2, 1644) to the effect that “an army compounded of these men will never go through with your service, and till you have an army merely your own that you may command, it is in a manner impossible to do anything of importance.” Simultaneously with the New Model came the Self-Denying Ordinance, which required all members of parliament to lay down their military commands. Waller did so gladly—the more as he had already requested and had been granted a civil commission—and his active military career came to an end. But the events of 1643–1644 had done more than embitter him. They had combined with his Presbyterianism to make him intolerant of all that he conceived to be licence in church, state or army, and after he ceased to exercise command himself he was constantly engaged, in and out of parliament, in opposing the Independents and the army politicians, and supporting the cause of his own religious system, and later that of the Presbyterian-Royalist opposition to the Commonwealth and Protectorate régime. He was several times imprisoned between 1648 and 1659. In the latter year he was active in promoting the final negotiations for the restoration of Charles II. and reappeared in the House of Commons. He sat
in the Convention Parliament, but soon retired from political life, and he died on the 19th of September 1668.

See Wood's *Allotiae Oxonienses*, ed. Bliss, iii. 812; and two partial autobiographies, *Recollections by General Sir William Waller* (printed in the *Poetry of Anna Madida*, 1788), and *Vindication of the Character*, &c. (1797).

Sir William Waller's cousin, Sir Hardress Waller (c. 1604-1666) was also a parliamentarian of note. Knighted by Charles I. in 1629, he gained military experience in serving against the rebels in Ireland; then from 1645 to the conclusion of the Civil War he was in England commanding a regiment in the new model army. He was Colonel Pride's chief assistant when the latter "purged" the House of Commons in 1648, and he was one of the king's judges and one of those who signed the death warrant. During the next few years Waller served in Ireland, finally returning to England in 1660. After the restoration he fled to France, but soon surrendered himself to the authorities as a regicide, his life being spared owing to the efforts of his friends. He was, however, kept in prison and was still a captive when he died.

**WALLINGFORD.** A township of New Haven county, Connecticut, U.S.A., S.W. of the centre of the state, in the valley of the Quinnipiac river. It contains the villages of East Wallingford, Tracy and Yalesville, and the borough of Wallingford. Pop. of the township (1900) 9001, (1910) 11,155; of the borough (1900) 6737, of whom 1706 were foreign-born and 21 were negroes, (1910) 8690. Area of the township, about 38 sq. m. The borough is 12 m. N.E. of New Haven, on a hill about 1 m. long, and 1 m. wide. It forms part of the New York & Hartford railroad (which has stations also at East Wallingford and Yalesville) and by an interurban electric line connecting with Meriden and New Haven. The borough has a public library (1881), a Masonic Home, the Gaylord Farm Sanatorium of the New Haven County Anti-Tuberculosis Association, the Phelps School (for girls) and the Choate School (1896, for boys). Among the manufactures of the borough are sterling silver articles, plated and britannia ware, brass ware, rubber goods, cutlery and edge tools. The township of Wallingford was settled in 1670. At a meeting held in January 1766, in protest against the Stamp Act, it was declared, that "Whereas it appears from ancient Records and other Memorials of Incontestible Validity that our Ancestors with a great Sum Purchased said township, with great Peril possessed and Defended the Same, we are Born free (having never been in bondage to any), an inheritance of Inestimable Value," and a penalty of 20£ was imposed upon any one who should introduce or use stamped paper or parchment. During the War of Independence patriotic sentiment here was strong and Loyalists were sometimes exiled to Wallingford, where they could have no effective influence. The borough of Wallingford was incorporated in 1832. In 1853 or 1854 a company was organized to erect a town hall, which was completed in 1855. In 1857 a town hospital was established, and in 1858 a town library was organized. In 1875 a town hall and grammar school were built. In 1880 a high school was organized. The town has a daily newspaper, the *Hartford Morning Post*. The town is divided into 12 districts.

See C. H. S. Davis's *History of Wallingford* (Meriden, 1870).

**WALLINGFORD.** A market town and municipal borough in the Abingdon parliamentary division of Berkshire, England, 31 m. W. by N. of London by the Great Western railway. Pop. (1901) 2808. It is pleasantly situated in the flat valley of the Thames, on the west (right) bank. The railway station is the terminus of a branch line from Cheltenham. Of the churches only St Leonard's, retaining its Norman tower, and rebuilt apse, in the older original plan, with an eastern apse, is of interest. The ancient castle has left only its mound and earthworks, and other works may be traced surrounding the town on the landward side. The town hall, raised on arches, dates from 1670. The large grammar school was founded in 1650. The trade of the town is principally agricultural; and malting is carried on. The borough is under a mayor, 4 aldermen and 12 councillors. Area, 350 acres.

The site of Wallingford (Wærgæford, Wylyngford, Wylyngfort), was occupied by a Romano-British settlement, though the imposing earthworks are of uncertain date—they may be of post-Roman British origin. Wallingford was a fortified town before the Conquest, and, though burned by Sweyn in 1066, was much the largest and most important borough in Berkshire at the time of the Domesday Survey. The new castle was so extensive that eight houses had been demolished to make room for it; the market was already in existence, and perhaps also the gild merchant, which in a charter of Henry II. is said to date back to the reign of the Confessor. In the reign of Henry I. the building of the town was either temporarily suspended or stopped altogether. It was again started under Henry II., who permitted a fair to be held at Wallingford, and who granted the right of holding fairs and markets at Wallingford, and that the town was to be called Wallingford. This charter was renewed under Henry III. in 1257. It was confirmed and enlarged by Henry III. in 1267 and by Philip and Mary in 1557-1558. In 1648 the corporation consisted of a mayor, three aldermen, a chamberlain and sixteen burgesses. This constitution was remodelled in 1650 by a charter from Cromwell, but the governing charter until the passing of the Municipal Corporations Act of 1835 was that given by Charles II. in 1653, incorporating the town under the style of a mayor, recorder, town clerk, six aldermen, two burgesses, a chamberlain and eight assistants of the better sort of the inhabitants. In 1571 Elizabeth issued letters patent empowering the burgesses of Wallingford to take toll of all carts passing over their bridge, in order to provide for its repair and maintenance. Wallingford sent two members to parliament from 1295 to 1832, and one from 1832 to 1885, when its representation was merged in that of the county: before 1832 the franchise was vested in the inhabitants paying scot and lot. The empress Maud took refuge at Wallingford after her escape from Sheriff Castle (1144), and here peace was made between her and Stephen (1153). Wallingford Castle was one of the last strongholds to hold out for Charles I., and during the Commonwealth it was demolished by order of the government. In 1605 the king commanded the sheriff of Oxford to cause a fair to be held at Wallingford at Whitsun for four days, to be continued for three years. In 1272 Swyncombe fair was transferred from the feast of St. Botolph to the feast of St Mark in order not to interfere with Wallingford fair. Fairs on the days of St Nicholas and of St John the Baptist were granted by Henry VII. in 1500, and the charter of 1503 provided for two markets and four annual fairs. All the latter have fallen into disuse except the Michaelmas fair, which is principally for hiring servants. During the 18th century the town was fairly prosperous and had a good trade in grain and malt.

**WALLIS, JOHN** (1616-1703), English mathematician, logician and grammarian, was born on the 23rd of November 1616 at Ashford, in Kent, of which parish his father, Rev. John Wallis (1567-1622), was incumbent. After being at school at Ashford, Tenterden and Felsted, and being instructed in Latin, Greek, Hebrew and mathematics, he was sent to Emmanuel College, Cambridge, and afterwards was chosen fellow of Queens' College. Having been admitted to holy orders, he left the university in 1641 to act as chaplain to Sir William Darby, and in the following year accepted a similar appointment from the widow of Sir Horatio Vere. It was about this period that he displayed surprising talents in deciphering the intercepted letters and papers of the Royalists. His adherence to the parliamentary party was in 1643 rewarded by the living of St Gabriel, Fen-church Street, London. In 1644 he was appointed one of the scriveners or secretaries of the Assembly of Divines at Westminster. During the same year he married Susanna Glyde, and thus
vacated his fellowship; but the death of his mother had left him in possession of a handsome fortune. In 1645 he attended those scientific meetings which led to the establishment of the Royal Society. When the Independents obtained the superiority Wallis adhered to the Solemn League and Covenant. The living of St Gabriel he exchanged for that of St Martin, Ironmonger Lane; and, as rector of this parish, he in 1663, on the occasion of putting Charles I. to death. Notwithstanding this act of opposition, he was in June 1649 appointed Savilian professor of geometry at Oxford. In 1654 he there took the degree of D.D., and four years later succeeded Gerard Langbaine (1609–1658) as keeper of the archives. After the restoration he was named one of the king's chaplains in ordinary. While complying with the terms of the Act of Uniformity, Wallis seems always to have retained moderate and rational notions of ecclesiastical polity. He died at Oxford on the 28th of October 1703.

The works of Wallis are numerous, and relate to a multiplicity of subjects. His *Institutio Logicae*, published in 1667, was very popular, and in his *Arithmeticis Logicae Systema* were brought together observations of an acute and philosophic intellect. The mathematical works are published, some of them in a small 4to volume (Oxford, 1657) and a complete collection in three thick folio volumes (Oxford, 1685–1699). The first volume contains, however, only geographical treatises, and the first part of it is occupied with editions of treatises on harmonics and other works of Greek geometers, some of them first printed with Latin paraphrases by Meibomius, and others (Ptolemy, Porphyrius, Brieniumus, Archimedes, Eutocius, Aristarchus and Pappus). The second and third volumes include also his correspondence with his contemporaries; and there is a tract on trigonometry by Caswell. Excluding all these, the mathematical works contained in the first two and second volumes occupy about 1800 pages. The titles in the order adopted, but with date of publication, are as follows: "Orat. inter linearum proprietat. et imagin. (1646); "Mathesis universalis, seu ars mathematicam philosophic et mathematic matricium, arithmetica numerosam et speciosam aliquae continet (1651); "De sectionibus conicis (1652); "De sectionibus conicis novo modo expositis (1655); "Arithmetica infinitarum, sive nova methodus inquirendi in curvilinearum quadraturas aliqua difficilia matheose probatam (1658); "Eclipsis solaris observatio Oxoni habitab in Aug. 1654 (1655); "Tractatus duo, prior de cycloide, posterior de cissode et de curvarum tum linearum et curvarum superficierum (1656); "Mechanica, sive de motu tractatus quatuor" (three parts, 1660–1667–1667); "De algebra tractatus historicius et practici, ejusdem origine et progressus varios ostendens" (English, 1668); "De combinationibus alternatis et continuatibus" (English, 1667); "De sectionibus conicis angulatius tractatus" (English, 1668); "De angulo contactus et semicirculi tractatus" (1669); "Ejusdem tractatus defensio" (1669); "De postulato quinto, & quinta definitione, lib. 1 al. sect. 8" (1670); "De curvarum, suo corpus partim comum partim cuneum representan geometrice consideratur" (English, 1665); "De gravitate et gravitas" (English, 1672); "De asynt maris hypothesis nova" (1666–1669).

The *Arithmetica Infinitorum* relates chiefly to the quadrature of curves by the so-called method of indivisibles established by Bonaventura Cavalieri in 1639 (see Infinitesimal Calculus). He extended the "law of continuity" as stated by Johannes Kepler; regarded the denominators of fractions as powers with negative exponents; and deduced from the quadrature of the parabola the area of the curves when $n$ is negative or fractional. He attempted the quadrature of the circle by interpolation, and arrived at the remarkable expression known as Wallis's Theorem, containing the same result as Tartaglia's, but obtained an expression for the length of the element of a curve, which reduced the problem of rectification to that of quadrature. The *Mathesis Universalis*, a more elementary work, contains copious dissertations on fundamental points of algebra, arithmetic and geometry, and critical remarks.

The *De Algebra Tractatus* contains (chaps lxi.-lxxi.) the idea of the square root of a negative quantity, which is given somewhat as follows: the distance represented by the square root of a negative quantity cannot be measured in the line backwards or forwards, but can be measured in the same plane above or below the line appearing elsewhere but right angles to the line either in the plane, or in the plane at right angles thereto. Considered as a history of algebra, this work is strongly objected to by Jean Etienne Montucla on the ground of its gross ignorance of early Italian algebraists and also Francesco Viceta and René Descartes and in favour of Harriot; but Augustus De Morgan, while admitting this, attributes to it considerable merit. The symbol for infinity, $\omega$, was invented by him.
WALLOONS

révolutionnaire de Paris avec le journal de ses actes (6 vols., 1880-1882); La Révolution du 31 mai et le fédéralisme en 1793 (2 vols., 1885); Les Répétitants du peuple en mission et la justice révolutionnaire dans les départements (5 vols., 1880-1890). Besides these he published a number of articles in the Journal des savants; for many years he wrote the history of the Académie des Inscriptions in the collection of Mémoires of this Academy, and he composed obituary notices of his colleagues, which were inserted in the Bulletin. He died at Paris on the 13th of November 1904.

WALLOONS (Wallons, from a common Teut. word meaning "foreign," cf. Ger. welsch, Du. waelsch, Eng. Welsh), a people akin to the French, but forming a separate branch of the Romance race, inhabiting the Belgian provinces of Hainaut, Namur, Liège, parts of Luxembourg and southern Brabant, parts of the French departments of Nord and Ardennes, and a few villages in the neighbourhood of Malmedy in Rhenish Prussia. The Walloons are descended from the ancient Gallic Belgae, with an admixture of Roman elements. They are in general characterized by greater vivacity and adaptability than their Flemish neighbours, while they excel their French neighbours in endurance and industry. Their numbers are reckoned in Belgium at between 2,000,000 and 3,000,000. The Walloon dialect is a distinct branch of the Romance languages, with some admixture of Flemish and Low German. It was used as a literary language until the 15th century, when it began to be assimilated to French, by which it was ultimately superseded.

As early as 1852, Delaître published, De la situation des Walloons (Liège, 1852), Vocabulaire des noms wallons, &c. (2nd ed., 1857), and Dict. synonymique de la langue wallonne (t. i. and ii., 1845-1851; t. iii., by Scheler, 1880). J. Dejardin, Dict. des "spots ou proverbes wallons" (1863); Van der Kindere, Répartition de l'éloquence (Brussels, 1875); G. Normant, Le Flamand, le Wallon, l'Ouvrier (Liège, 1889); M. Wilmutte, Le Wallon, Histoire et littérature (Brussels, 1893); Monsieur Le Folklore wallon (Brussels, 1892). [X.]

WALLOON LITERATURE.—In medieval times various local documents in prose and verse were written by inhabitants of Liège and its diocese in a dialect of French which contained many Walloon words and phrases. It is supposed that as early as the 12th century the idiom of the people may have been used in songs which are now lost, unless echoes of them are preserved in the curious Noëls, partly in French, partly in patois, which were orally collected by M. Doutrepont and published in 1888. Several Flemish works in old French, containing Walloon expressions, and in particular the so-called Poème moral of the 13th century, have been claimed as precursors of a local literature, but they are really to be considered as composed in French with a certain admixture of Liégeois phrases. The earliest existing specimen of pure Walloon literature is the Ode in praise of Liège, dated 1629, and attributed to Mathias Navages; this was first printed in 1857 in the transactions of the Société Liégeoise. Except a few very flat popular songs, there is nothing more until the end of the 17th century, when we find Lis Alles di Tongue (The Waters of Tongres), an amusing lyric satire at the pretensions of that town to be considered a Roman spa. Fifty years later the opening of a popular theatre at Liège led to the creation of a class of farces, written in Walloon; of these Li Veige di Chaudfontaine (The Journey to Chaudfontaine) (1757), by Jean-Noël Hamoir, has considerable humour and vivacity. Other successful comedies were Li Fiesse di Hongròplou, Li Liégeois écagé, and, above all, Lis Hypocoques, the liveliest specimen of old Walloon literature which has survived. This diverting farce describes the adventures of a party of mock-invalids, who pursue a series of intrigues at a spa. This class of dramatic literature closed with Li Maligants in 1789. In these early songs and plays the Walloon humour is displayed with great cruelty; anything like sentiment or elevated feeling is unknown.

The Revolution of 1789 inspired numerous Liégeois patriots with popular songs; of these pasqueyes, as they are styled, Albin Body collected more than 250, but they are almost entirely devoid of literary merit. Under their new government, Liège and Namur allowed the national patois to withdraw into the background, and it was not until the middle of the 19th century that Walloon literature began seriously to be cultivated. Its only expression, for a long time, was in lyrical poetry in the form of satires and the humorous songs, called pasqueyes and crémougnens. The earliest of these modern Wallon writers was Charles Nicolas Simonon (1774-1847), who celebrated in Li Copère the ancient clock-tower of the cathedral of St Lambert, an object of reverence to the inhabitants of Liège. His poems were collected in 1845. Henri Joseph Foré (1784-1862) was the first president of the Société Liégeoise, and one of the protagonists of Wallon literature. He published a valuable dictionary of the patois. The Curé C. E. E. Du Vivier de Steel (1799-1866) was the author of Li Pasional trawé (The Torn Trousers), a pasquey which still enjoys an enormous popularity among the Wallon population. The first Wallon writer of high merit, however, was Nicolas Defrereux (1825-1874), who is the most distinguished poet whom the patois has hitherto produced. His Les Bauté-mi plorer (Let me cry), when it appeared in 1842, made a wide sensation, and was the earliest expression of what is serious and tender in the Wallon nature. His Chansons wallonnes appeared in 1850. Defrereux stands almost alone among the Wallon poets as an artist and not merely an improvisatore. His poetical works were posthumously collected in 1877.

For many years, in spite of the efforts of such scholars as MM. Alphonse Le Roy and H. Gaidoza, a taste for Wallon literature remained strictly circumscribed, and was limited to a small circle of enthusiasts in Liège and Namur. In 1872 a literary society was formed, the Société Belge de Littérature wallonne, and at the instance of its presidents, M. Wallon and M. Defrereux, a translation of the works of Charles Simonon and Pierre Dejardin was published. This effort was attended with considerable success, and the translation of Le Prélàve and certain of his humorous lyrics was undertaken by M. G. G. Dejardin. In 1875 a Wallon Literary Society (Societe d'étude de la Littérature Wallonne, Brussels) was formed, which did much to arouse the interest of the local patois. By the efforts of M. M. G. Dejardin, Wallon literature made a very considerable impression on the Wallon public, which had been entirely neglected for more than a century, once more was called into existence through the exertions of the theatrical club, called Le Wallon. The comedies of A. M. J. Delche (b. 1835) were acted with success, and led the way for the most important patois dramatist that Liège has produced, Édouard Remouchamps (b. 1836), who is the author of Taut l'Errattr (1884), perhaps the most entertaining farce in Wallon, and certainly the most popular. Remouchamps was for thirty years a prolific writer of short pieces for the stage, sentimental and farcical. After the success of this play, according to an enthusiastic chronicle, "the writers of Wallonia became legion." Their style, however, was not greatly varied, and they have mainly confined themselves to songs, satirical lampoons and farces. The founder of the Société Liégeoise was J. F. E. Bailleux (1817-1860), to whom the revival of an interest in early Wallon literature is mainly due; in conjunction with J. V. F. J. Dehin (1809-1871) he published a translation of Lafontaine into patois. Among writers of the younger generation, special credit must be given to Henri Simon (b. 1856), for his humorous tales and sketches; to Julien Bason (b. 1868), for his amusing lyrics; and to Zéphir Henin (b. 1866), for his prose, prose being much rarer than verse in Wallon. It would be possible to add very largely to this list, but the most notable names have been mentioned. A certain monotonous fluency is the fault of Wallon literature, which repeats its effects too constantly, and is confined within too narrow limits. A few writers, among whom Isidore Dory (b. 1833) is prominent, have endeavoured to enlarge the scope of the patois writers, but their suggestions have met with little response. When the Wallon writer desire to impart serious information or deep feeling, he resorts to the use of French. The pasqueye, which is the characteristic form of Wallon verse, is a kind of semi-comic and extremely familiar lyric, humorous and extravagant, a survival of the influence of Béranger on taste three-quarters of a century ago; the facility with which these songs are composed is betrayed by the numerous number of them which exist in Liège and Namur. The difficulties of Wallon literature are increased by the unfixed character of its phonetic and often extravagant orthography.

WALROP, SIR HENRY (c. 1540-1590), English statesman, was the eldest son of Sir Oliver Wallop (d. 1560), of Farleigh Wallop, Hampshire. Having inherited the estates of his father and of his uncle, Sir John Wallop (q.v.), he was knighted in 1569 and was chosen a deputy-sheriff in 1572. His connexion with Ireland, where the quarter part of his public life was passed, began in 1579, when he was appointed vice-treasurer of that country; this position was a very thankless and difficult one, and Wallop appears to have undertaken it very unwillingly. However, he reached Dublin and was soon immersed in the troubles caused by the rebellion of Gerald Fitzgerald, earl of Desmond, finding, in his own words, it was "easier to talk at home of Irish wars than to be in them." In July 1582 he and Adam Loftus, archbishop of Dublin, were appointed lords justices and they were responsible to the government of Ireland for just two years, after which they were succeeded by Sir John Perrot. Sir Henry continued to fill the office of vice-treasurer, and at Enniscorthy, where he had secured a lease of lands, he set up a colony of Englishmen and opened up a trade with Madeira. As a member of the Irish council he quarrelled with Perrot, and then from 1589 to 1595 he was in England, entertaining the queen at Farleigh Wallop in 1591. Having returned to Ireland he was sent to Dundalk to attempt to make peace with Hugh O'Neill, earl of Tyrone, but this proved a vain errand. At length, after many misadventures, he was allowed to return to Dublin, and before he could arrange to leave Ireland he died on the 14th of April 1599.

Wallop's eldest son, Sir Henry Wallop (1568-1642), who acted as his father's deputy in Ireland, left an only son, Robert Wallop (1601-1667). A member of parliament for nearly forty years, and a supporter of the parliamentary party, Robert was one of the judges of Charles I, although he did not sign the death warrant. He was active under the Commonwealth, being a member of nearly all the councils of state. At the restoration he was deprived of his estates and was imprisoned, and he died in the Tower of London on the 19th of November 1667. Robert's son Henry (d. 1673) was the grandfather of John Wallop, 1st earl of Portsmouth.

WALROP, SIR JOHN (c. 1490-1551), English soldier and diplomatist, belonged to an old Hampshire family. Adopting the profession of arms, he commanded ships which took part in the war between England and France in 1513 and 1514; later he served the king of Portugal against the Moors, and then he fought for his own sovereign in Ireland and in France. In 1526 Wallop began his diplomatic career, being sent on an errand to Germany by Henry VIII, and from that time till his death he spent much of his time in Paris and elsewhere in France as the representative of the English king. He filled several other public positions, including that of lieutenant of Calais, before January 1541, when he was suddenly arrested on a charge of treason; his offence, however, was not serious and in the same year he was made captain of Guines. In 1543 he led a small force to help the emperor Charles V. in his invasion of France, and he remained at his post at Guines until his death there on the 13th of July 1551.

Walqvist, Olaf (1755-1800), Swedish statesman and ecclesiastic, was ordained in 1776, became doctor of philosophy in 1779, court preacher to Queen Louisa Ulrica in 1780, and bishop of Vaxio in 1787. He attracted the attention of Gustavus III. by his eloquent preaching at the fashionable St Clara church at Stockholm. Gustavus at once took the young priest by the hand, appointed him, at twenty-five, one of his chaplains; made him a canon before he was thirty and a bishop at thirty-two, and finally placed him at the head of the newly appointed commission for reforming the ecclesiastical administration of the country. Thus at thirty-four Walqvist had nothing more to hope for but the primacy, which would infallibly have been his also had the archbishop died during the king's lifetime. Walqvist was, however, much more of a politician than a churchman. His knowledge of human nature, inexhaustible energy, dauntless self-confidence and diplomatic finesse made him indispensable to Gustavus III. His seductive manners too often won over those whom his commanding eloquence failed to convince. His political career began during the tumultuous riksdag of 1786, when he came boldly forward as one of the royalist leaders. But it was at the stormy riksdag of 1789 that Walqvist put forth all his powers. The retirement of the timid prince left him without an equal in the Estate of Clergy, and it was very largely due to his co-operation that the king was able to carry through the famous "Act of Unity and Security" which converted Sweden from a constitutional into a semi-absolute monarchy. Nevertheless, even the combative Walqvist was appalled when on the 16th of February 1789 the king privately informed him that he meant on the following day soundly to wound the Estate of Nobles in the presence of the three other estates and bend them to his royal will. A friend of Gustavus, and, like most of the men of his cloth, Walqvist dissuaded all revolutionary expedients at the outset, though when the king proved immovable the bishop materially smoothed the way before him. At this memorable riksdag Walqvist exhibited, moreover, financial ability of the highest order, and, as president of the ecclesiastical commission, assisted to equilibrate the budget and find the funds necessary for resuming the war with Russia. During the brief riksdag of 1792, as a member of the secret committee, Walqvist was at the very centre of affairs and rendered the king essential services. Indeed it may be safely said that Gustavus III., during the last six years of his reign, mainly depended upon Walqvist and his clerical colleague, Carl Gustaf Nordin (q.v.), who were patriotic enough to subordinate even their private emolument to the royal service. During the Reuterholm (q.v.) administration, Walqvist, like the rest of the Gustavians, was kept remote from court. In 1806 he was recalled to the political arena. But his old rivalry with Nordin was resumed at the same time, and when the latter defeated a motion of the bishop in the Estate of Clergy, at the diet of Norrköping, Walqvist from sheer vexation had a stroke of apoplexy and died next day.

As bishop of Vexio, Walqvist was remarkable for his extraordinary administrative ability. He did much for education and for the poorer clergy, and endowed the library of the gymnasium with 6000 volumes. As an author also he was more than distinguished. His Ecclesiastica Samlingar testify to his skill and diligence as a collector of MSS., while his Minnen och Bref, ed. E. V. Montan (Stockholm, 1878), is one of the most trustworthy and circumstantial documents relating to the Gustavian era of Swedish history.

See R. N. Bain, Gustavus III. and his Contemporaries (London, 1869), vol. 10; O. Walqvists Sjöborgska anteckningar (Uppsala, 1850); and J. Rosengren, Om O. Walqvist såsom Biskop och Eftorn (Vexio, 1901).

(Emb.)

WALLSEND, a municipal borough in the Tyneside parliamentary division of Northumberland, England, on the north bank of the Tyne, 3½ m. E.E. of Newcastle by a branch of the North-Eastern railway. Pop. (1891) 11,257; (1901) 20,018. The Church of St Peter dates from 860. There are remains of the church of the Holy Cross in transitional Norman style. At an early period Wallsend was famous for its coal, but the name has now a general application to coal that does not go through a sieve with meshes five-eighths of an inch in size. The colliery, which was opened in 1807, has frequently been the scene of dreadful accidents, notably on the 23rd of October 1821, when 52 lives were lost. There are ship and boat building yards, engineering works, lead and copper smelting works, cement works and brick and tile works. In the river are two pontoon docks and an immense dry dock. Wallsend was incorporated in 1901, and the corporation consists of a mayor, 6 aldermen and 18 councillors. Area, 1202 acres.

Walmer denotes its modern name from its position at the eastern extremity of the Roman Hadrian's Wall; and there was a Roman fort here. It had a quay, of which remains have been discovered, and possessed a magazine of corn and other provisions for the supply of the stations in the interior.

WALMER, a watering-place, and member of the Cinque Port of Sandwich, in the St Augustine's parliamentary division of
Kent, England, 2 m. S. of Deal, on the South-Eastern & Chatham railway. Pop. of urban district (1901) 5248. Lower Walmer, the portion most frequented by visitors, extends northward along the coast, so as to be contiguous with Deal. Upper Walmer is a short distance inland, and below it Walmer Castle lies close to the sea. This was a blockhouse built for coast defence by Henry VIII., but became the official residence of the Lords Warden of the Cinque Ports, and was in consequence much altered from its original condition. It ceased to be the official residence in 1905, when the prince of Wales (afterwards George V.) was appointed Lord Warden, and the public was given access to those rooms which possess historical associations with former holders, such as the Duke of Wellington, who died here in 1852, William Pitt and others. Kingsdown, 1 m. south, is a decayed member of the Cinque Port of Dover.

WALMSLEY, THOMAS ATTWOOD (1814-1859), English musician, was born in London, his father Thomas Forbes Walmsley (1783-1866) being a well-known organist and composer of church music and glee. Thomas Attwood (q.v.) was his godfather, and the boy was educated in music under their tuition. He became organist at Trinity College, Cambridge, in 1833, and there he soon became prominent by his anthems and other compositions. He not only took the degrees of Mus.Bac. and Mus.Doc., but also graduated at Jesus College as B.A. and M.A. In 1836 he was made professor of music. His Cathedral Music was edited after his death by his father.

WALNUT (Juglans), a botanical genus of about ten species (nat. ord. Juglandaceae), natives of the temperate regions of the northern hemisphere, extending into Mexico, the West Indies and tropical South America. They are all trees, usually of large size, with alternate stalked, unequally pinnate leaves, and abounding in an aromatic resinous juice. The scars left by the fallen leaves are unusually large and prominent. The buds are not unlike those of the ash; and it frequently happens that in the axils of the leaves, instead of one, several buds may be formed. The utility of this is seen in seasons when the shoot produced from the first bud is killed by frost; then one of the supplementary buds starts into growth, and thus replaces the injured shoot. The flowers are unisexual and monoeious, the numerous males borne in thick cattkins proceeding from the side of last year's shoot. The female flowers are solitary or few in number, and borne on short terminal spikes of the present season's growth. In the male flower the receptacle is "conspicuously shorter" from the ovary to the base of the perianth. The receptacle is, in consequence, extended more or less horizontally so that the flowers appear to be placed on the upper surface of horizontally spreading stalks. The perianth consists of five or six oblong greenish lobes, within which is found a tuft, consisting of a large number of stamens, each of which has a very short filament and an oblong two-lobed anther bursting longitudinally, and surmounted by an oblong lobe, which is the projecting end of the connective. There is usually no trace of ovary in the male flowers, though by exception one may occasionally be formed.

The female flower consists of a cup-like receptacle, inseparable from the ovary, and bearing at its upper part a bract and two bracteoles. From the margin springs a perianth of four short lobes. The one-celled ovary is immersed within the receptacular tube, and is surmounted by a short style with two short ribbon-like stigmatic branches. The solitary ovule springs erect from the base of the ovarian cavity. The fruit is a kind of drupe, the fleshy husk of which is the dilated receptacular tube, while the two-valved stone represents the two carpels. The seed is large, very solid and of a yellowish colour, and curiously crumpled cotyledons concealing the plumule, the leaves of which, even at this early stage, show traces of pinnae.

The species best known is J. regia, the common walnut, a native of the mountains of Greece, of Armenia, of Afghanistan and the north-west Himalayas. Traces of the former existence of this or of a very closely allied species are found in the Post-Tertiary deposits of Provence and elsewhere, proving the former much wider extension of the species. At the present day the tree is largely cultivated in most temperate countries for the sake of its timber or for its edible nuts. The timber is specially valued for furniture, and the beauty of its markings rendering it desirable for the first-named purpose, while its strength and elasticity fit it for the second. The leaves and husk of the fruit are resinous and astringent, and are sometimes used medicinally as well as for dyeing purposes. A Spiritus Nucis Juglandis is given as an antispasmodic. It doubtless owes its properties to the alcohol which it contains. Sugar is also prepared from the sap in a similar manner to that obtained from the maple. The young fruits are used for pickling. When ripe the seeds are much esteemed as a delicacy, while in France much oil of fine quality is extracted from them by pressure. There are several varieties in cultivation, varying in the degree of hardiness, time of ripening, thickness of shell, size and other particulars. In the climate of Great Britain a late variety is preferable, as securing the young shoots against injury from frost, to which otherwise they are very subject. The kernel of the large-fruited variety is of very indifferent quality, but its large shells are made use of by the French as trinket cases.

The walnut is mentioned in the earliest British botanical writings, and the species has since been introduced by the Romans. It grows well, and ripens its fruit in the southern and midland counties of England; but large trees may be seen as far north as Rose-shire in Scotland. The nut is spherical or oblong, one to two inches long, and in stiff loams resting on a gravelly bottom. It requires free exposure to air and light. It is propagated by seeds, and occasionally by budding, grafting or inarching for the perpetuation of special varieties. Seedlings should be protected from frost during the first winter. The trees form their heads naturally, and therefore little pruning is required, it being merely necessary to cut off straggling growths, and to prevent the branches from interlacing. The best time for pruning this is in the late winter, when the shoots of the year are green and have nearly assumed the character of the leaf. Plants raised from the seed seldom become productive till they are twenty years old. The fruit is produced at the extremities of the branches. Two out of three of the young shoots of the crop, care should be taken not to injure the young wood. In some parts of England the trees are thrashed with rods or poles to obtain the nuts, but this is not a commendable mode of collecting them.

Among the American species J. nigra, the black walnut, is especially noteworthy as a very handsome tree, whose timber is of great value for furniture purposes, but which is now becoming scarce. In Britain it forms a magnificent tree. The white walnut or butternut, J. cinerea, is a smaller tree, though it sometimes reaches 100 ft. in height; its inner bark yields an extractive, juglandin, given as an hepatic stimulant and cathartic in doses of 2-5 grains.

WALPOLE, HORATIO or HORACE (1717-1797), English politician and man of letters, 4th earl of Orford—a title to which he only succeeded at the end of his life, and by which he is little known—was born in Arlington Street, London, on the 24th of September 1717. He was the youngest of the five children of the 1st earl of Orford (Sir Robert Walpole) by Catherine Shorter, but by some of the scandal-mongers of a later age, Carr, Lord Hervey, half-brother of John, Lord Hervey, afterwards second earl of Bristol, has been called his father. If this rumour be correct, no such suspicion ever entered into the mind of Horace Walpole. To his mother he erected a monument, with an inscription couched in terms of sincere affection, in the chapel of Henry VII. in Westminster Abbey, and from the beginning to the end of his public life his sarcasms never spared the Newcastles and the Hardwicke, who had shown, as he thought, lukewarmness in support of his father’s ministry. On the 20th of April 1727 he was sent to Eton, where he formed what was known as the "Garter Club," in which Hardwicke, Horace Walpole and Thomas Ashton, and became very intimate with Henry Seymour Conway, George Augustus Selwyn and the two Montagu, and in 1735 matriculated at King’s College, Cambridge. Two years (1750-1751) were spent in Gray’s company in the recognized grand tour of France and Italy. They stopped a few weeks in Paris, and lingered for three months at Rheim, on the pretence of learning the French language. Henry Seymour Conway, whose mother was a sister of Lady Walpole, shared their society in the French city. The
other two members of this little circle next proceeded to Florence, where Walpole rested for more than a year in the villa of Horace Mann, the British envoy-extraordinary for forty-six years to the court of Tuscany. Mann's family had long been on terms of the closest intimacy with his guests, and they continued correspondence until 1788. As the 5th Earl of Cholmondeley, their friendship, unlike most of Walpole's attachments, remained unbroken. After a short visit to Rome (March-June 1740), and after a further sojourn at Florence, Walpole and Gray parted in resentment at Reggio. Walpole in after years took the blame of this quarrel on himself, and it is generally believed that it arose from his laying too much stress on his superiority in position. In 1744 the two friends were nominally reconciled, but the breach was not cemented.

Walpole came back to England on the 11th of September 1741. He had been returned to parliament on the 14th of May 1741 for the Cornish borough of Callington, over which his elder brother, through his marriage with the heiress of the Rolles, exercised supreme influence. He represented three constituencies in succession, Callington 1741-1754, the family borough of Castle Rising from 1754 to 1757, and the more important constituency of King's Lynn, for which his father had long sat in parliament, from the latter date until 1768. In that year he retired, probably because his success in political life had not equalled his expectations, but he continued until 1784 in the days of Walpole's son, and afterwards in the speeches of both houses of parliament. Through his father's influence he had obtained three lucrative sinecures in the exchequer, and for many years (1745-1784) he enjoyed a share, estimated at about £1,500 a year, of a second family perquisite, the collectorship of customs. These resources, with a house in Arlington Street, which was left to him by his father, enabled him, a bachelor all his days, to gratify his tastes. He acquired in 1747 the lease and in the next year purchased the reversion of the charmingly situated villa of Strawberry Hill, near Twickenham, on the banks of the Thames. Six years later he began a series of alterations in the Gothic style, not completed for nearly a quarter of a century later, under which the original cottage became transformed into a building without parallel in Europe. On the 25th of June 1757 he established a printing-press there, which he called "Officina Arbuteana," and many of the first editions of his own works were struck off within its walls. Through Walpole's influence Dodsworth published in 1753 the clever, if eccentric, designs of Richard Bentley (the youngest child of the great scholar, and for some time a protégé of Horace Walpole) for the poems of Gray. The first work printed at Strawberry Hill itself was a translation of Plutarch's Greek, by George Vertue, and among the reprints were the Life of Lord Herbert of Cherbury, Memoirs of Grammont, Hentzner's Journey into England, and Lord Whitworth's Account of Russia. The rooms of this whimsical edifice were crowded with curiosities of every description, and the house and its contents were shown, by tickets to admit four persons, between 12 and 3 from May to October, but only one party was admitted on each day, and the owner, although enamoured of notoriety, simulated discontent at this limited intrusion into his privacy. Walpole paid several visits to Paris, was present at the coronation of Louis XVI. in June 1774, and in 1755, and they corresponded until her death in 1780. His nephew, the reckless 3rd earl, died on the 5th of December 1791, and Horace succeeded to the peerage, but he never took his place in the House of Lords, and sometimes signed his name as "the uncle of the late earl of Orford." All his life long he was a victim of the gout, but he lived to extreme old age, and died unmarried, in Berkeley Square, London, to which he had removed in October 1779, on the 2nd of March 1797. He was buried privately at Houghton. The family estate descended to the earl of Cholmondeley, whose successor was his son Horace Walpole's younger sister. All Walpole's printed books and manuscripts were left to Robert Berry (d. 19th of May 1817) and his two daughters, Mary (1763-1852) and Agnes (1764-1839), and Mary Berry edited the five volumes of Walpole's works which were published in 1798. Their friendship had been very dear to the declining days of Walpole, who, it has even been said, wished to marry Mary Berry. By his will each of the ladies obtained a pecuniary legacy of £4,000, and for their lives the house and garden, formerly the abode of his friend Kitty Clive, which adjoined Strawberry Hill. Strawberry Hill went to Mrs Anne Damer, the Countess of Bristol, for the life of her daughter Kitty, who was afterwards the wife of General Conway, for her life, but it was entailed on his niece the countess dowager of Waldegrave and her heirs. The collections of Strawberry Hill, which he had spent nearly fifty years in amassing, were dispersed under the hammer of George Robins in 1842. They are described in a catalogue of that date, and in a series of articles in the Gentleman's Magazine for that year.

The pen was ever in Horace Walpole's hands, and his entire compositions would fill many volumes. His two works of imagination, the romance of the Castle of Otranto (1764) and the tragedy of the Mysterious Mother (1768), are known to have still retained its vitality for more than a century, is entitled Anecdotes of Painting in England, with some Account of the Principal Artists; collected by George Vertue, and now digested and published from his original manuscripts by Horace Walpole (4 vols., 1762-1771). Its value to art students and to admirers of biographical literature demanded its frequent reproduction, and it was re-edited with additions by the Rev. James Dallaway in five volumes (1826-1828), and then again was revised and edited by R. N. Wornum in 1849. A cognate volume, also based on the Journal of the 5th earl of Orford, and printed for his own use, was published as Specimens of English and Foreign Antiquities and Residence in England (1765), which, like its more famous predecessor, often passed through the press. On the Catalogue of Royal and Noble Authors of England (1758) Walpole spent many hours of toilsome research. The best edition is that which appeared in five volumes, in 1866, under the competent editorship of Thomas Park, who carefully verified and diligently augmented the labours of the original author. As a senator himself, or as a private person following at a distance the combats of St Stephen's, Walpole recorded in a diary the chief incidents in English politics. For twenty-seven years he studied, a silent witness, the most private and the most public events, and it was he who trod the stage of politics, and when he quitted the scene he retained the acquaintance of many of the chief actors. If he was sometimes prejudiced, he rarely distorted the acts of those whom he disliked; and his prejudices, which lie on the surface, were mainly against those whom he considered traitors to his father. These diaries extend from 1750 to 1783, and cover a period of momentous importance in the annals of the national history. The Memoirs of the Last Ten Years of the Reign of George II. was edited by Lord Holland (1846); its successor, Memoirs of the Reign of George III., was published as Early Life and Times of Sir Denis Le Marchant (4 vols., 1845), and re-edited in 1849 by Mr G. F. Russell Barker; the last volumes of the series, Journal of the Reign of George III. from 1774 to 1783, were edited and illustrated by John Doran (2 vols., 1859), and were
Walpole, Sir S.—WALPURGIS

edited with an introduction by A. F. Steuart (London, 1909). To these works should be added the Reminiscences (2 vols., 1810), which Walpole wrote in 1788 for the gratification of the Misses Berry. These labours would in themselves have rendered the name of Horace Walpole famous for all time, but his delightful Letters are the crowning glory of his life. His correspondents were numerous and widespread, but the chief of them were William Cole (1734–1752), the critic and biographer of Sir Robert Jephson, the dramatist; William Mason, the poet; Lord Hertford during his embassy in Paris; the countess of Osyory; Lord Harcourt; George Montagu, his friend at Eton; Henry Seymour Conway (1721–1795) and Sir Horace Mann. With most of these friends he quarrelled, but the friendship of the last two, in the former case through genuine liking, and in the latter through his fortunate absence from England, was never interrupted. The Letters were published at different dates, but the standard collection is that by Mrs Paget Tounbee (1909–1909), and to it should be added the volumes of the letters addressed to Walpole by his old friend Madame du Delfain (4 vols., 1810). Dr Doran’s publication, Mans and Manners at the Court of Florence (1876), is founded on the epistles sent in return to Walpole by the envoy-ordinary. Other works relating to him are Horace Walpole and his World, by L. B. Seeley (1884); Horace Walpole, a memoir by Austin Dobson (1890 and 1893); Horace Walpole and the Strawberry Hill Press, by M. A. Havens (1901). Walpole has been called “the best letter-writer in the English language”; and few indeed are the modern correspondents who can show that they can write letters with the same felicity and lightfulness, no less than with the same frivolity, with which Walpole’s correspondents are penned for our amusement, and his love of trifles—for, in the words of another Horace, he was ever “nescio quid meditans nugatur et totus in illis”—ministers to our instruction. To these friends he communicated every fashionable scandal, every social event, and the details of every political struggle in English life. The politicians and the courtiers of his day were more akin to his character than were the chief authors of his age, and the weakness of his intellectual perceptions stands out most prominently in his estimates of such writers as Johnson and Goldsmith, Gibbon and Hume. On many occasions he displayed great liberality of disposition and he bitterly deplored for the rest of his days his neglect of the unhappy Chatterton. Chatterton wrote to Walpole in 1760, sending some prose and verse fragments and offering to place information on English art in Walpole’s hands. Encouraged by a kindly reply, Chatterton appealed for help. Walpole made inquiries and came to the conclusion that he was an impostor. He finally returned the manuscripts in his possession, and took no notice of subsequent letters from Chatterton.

Abundant information about Horace Walpole will be found in the Memoirs of him and of his contemporaries edited by Elliot Warburton (1851), J. H. Jessé’s George Selwyn and his Contemporaries (4 vols., 1843–1844) and the extracts from the journals and correspondence of Miss Berry (3 vols., 1866); and it would be unparodonal to omit mention of Macaulay’s sketch of Walpole’s life and character. (W. P. C.)

Walpole, Sir Spencer (1839–1907), English historian and civil servant, was born on 6th of February 1839. He came of the younger branch of the family of the famous Whig prime minister, being descended from his brother, the 1st lord Walpole of Wolterton. He was the son of the latter’s great-grandson, the Right Hon. Spencer Horatio Walpole (1807–1868), thirce home secretary under Lord Derby, and through his mother was grandson of Spencer Perceval, the Tory prime minister who was murdered in the House of Commons. He was educated at Eton, and from 1858 to 1867 was a clerk in the War Office, then becoming an inspector of fisheries. In 1882 he was made lieutenant-governor of the Isle of Man, and from 1893 to 1899 he was secretary to the Post Office. In 1898 he was created K.C.B. Although well known as a most efficient public servant, and in private life as the most amiable of men, Sir Spencer Walpole’s real title to remembrance is as an historian. His family connections gave him a natural bent to the study of public affairs, and their mingling of Whig and Tory in politics contributed, no doubt, to that quality of judicious balance—inclining, however, to the Whig or moderate Liberal side—which, together with his sanity and accuracy, is so characteristic of his writings. His principal work, the History of England from 1815 (1878–1886), in six volumes, was carried down to 1858, and was continued in his History of Twenty-Five Years (1904). Among his other publications come his lives of Spencer Perceval (1864) and Lord John Russell (1859), and a volume of valuable Studies in Biography (1906); and the lecture he delivered to the Royal Historical Society, for the Encyclopædia Britannica. He died on the 7th of July 1907.

Walpole of Wolterton, Horatio, 1st Baron (1767–1757), English diplomatist, was a son of Robert Walpole of Houghton, Norfolk, and a younger brother of the great Sir Robert Walpole. The Walpoles owned land in Norfolk in the 18th century and took their name from Walpole, a village in the county. An early member of the family was Ralph de Walpole, bishop of Norwich from 1288 to 1290, and bishop of Ely from 1290 until his death on the 20th of March 1302. Among its most noted members were three brothers, Edward (1560–1637), Richard (1564–1607) and Michael (1570–1624), all members of the Society of Jesus. Another Jesuit in the family was Henry Walpole (1558–1595), who wrote An Epitaph of the life and death of the most famous clerk and virtuous priest Edmund Campion. After an adventurous and courageous career in the service of the order, he was arrested on landing in England, was tortured and then put to death on the 17th of April 1595.1

Born at Houghton on the 5th of December 1678 and educated at St John’s College, Cambridge, Horatio Walpole became a fellow of King's and entered parliament in 1716, remaining a member for fifty-four years. In 1714, when his brother, Sir Robert, became first lord of the treasury, he was made secretary to the treasury, and in 1716, having already some experience of the kind, he went on a diplomatic mission to The Hague. He left office with his brother in 1717, but he was soon in harness again, becoming secretary to the lord-lieutenant of Ireland in 1720 and secretary to the treasury a second time in 1721. In 1722 he was again at The Hague, and in 1723 he went to Paris, where in the following year he was appointed envoy extraordinary and minister plenipotentiary. He got on intimate terms with Fleury and seconded his brother in his efforts to maintain friendly relations with France; he represented Great Britain at the congress of Soissons and helped to conclude the treaty of Seville (November 1729). He left Paris in 1730 and in 1734 went to represent his country at The Hague, where he remained until 1740, using all his influence in the cause of European peace. After the fall of Sir Robert Walpole in 1742 Horatio defended his conduct in the House of Commons and also in a pamphlet, The Interest of Great Britain steadily pursued. Later he wrote an Apology, dealing with his own conduct from 1715 to 1720, and an Answer to the latter part of Lord Bolingsbroke’s letters on the study of history (printed 1763). In 1756 he was created Baron Walpole of Wolterton, this being his Norfolk seat, and he died on the 5th of February 1757. His eldest son, Horatio, the 2nd Baron (1723–1809), was created earl of Orford in 1806, and one of his sons was Major-General George Walpole (1758–1835), under-secretary for foreign affairs in 1806.

See W. Cox, Memoirs of Horatio, Lord Walpole (2nd ed., 1856); the same writer, Memoirs of Sir Robert Walpole (1846); and Charles, comte de Baillon, Lord Walpole à la cour de France (1867).

Walpurgis (Walpurga of Walburga), St (d. c. 780), English missionary to Germany, was born in Sussex at the beginning of the 8th century. She was the sister of Willibald, the first bishop of Eichstätt in Bavaria, and Wunnibald, first abbot of Heidenheim. Her father, Richard, is thought to have been a son of Hlothhere, 9th king of Kent; her mother, Winna or Wun, a sister of St Boniface. At the instance of Boniface and Willibald she went about 750 with some other nuns to found

1. The Letters of Henry Walpole, S.J., from the original manuscripts at St John’s College, are edited by the Rev. Augustus Jessopp, One Generation of a Norfolk House (1878).

2. French forms of the name are Gualibou, Falbou, Vaubourg and Avougourg.
WALRAS—WALRUS

religious houses in Germany. Her first settlement was at Bischofsheim in the diocese of Mainz, and two years later (1754) she became abbess of the Benedictine nunnery at Heidenheim in the diocese of Eichstadt. On the death of Wunnibald in 1760 she succeeded him in his charge also, retaining the superintendence of both houses until her death. Her relics were translated to Eichstadt, where she was laid in a hollow rock, from which exuded a kind of bituminous oil afterwards known as Walpurgis oil, and regarded as of miraculous efficacy against disease. It is still said to exude from the saint's bones (especially from October to February) and was chosen by Cardinal Newman as an example of a credible miracle. The cave became a place of pilgrimage, and a fine church was built over the spot. Walpurgis is commemorated at various times, but principally on the 1st of May, her day taking the place of an earlier heathen festival which was characterized by various rites marking the beginning of summer. She is regarded as the protectress against magic arts (cf. the Walpurgin-Nacht dance in Goethe's Faust). In art she is represented with a crozier, and bearing in her hand a flask of balsam.

Her life was written by the presbyter Wolfhard and dedicated to Erkenbald, bishop of Eichstadt (884-916). See the Bollandist Acta sanctorum, vol. iii. February 25. On Walpurgis, Wunnibald and Wunnibald see G. F. Browne, Boniface of Crediton and his Companions (London, 1910), vii.

WALRAS, MARIE ESPRIT LÉON (1834-1910), French economist, was born at Évreux in 1834. From 1866 to 1868 he edited a journal called Le Travail, to which he contributed many valuable political articles. In 1870 he was appointed professor of political economy at Lausanne, a post which he retained until his retirement in 1892. He died on the 4th of January 1910. Walras is best known for his mathematical treatment of economics, and the extreme care he has shown in his works in distinguishing theory and practice. His most important works are Éléments d'économie politique pure (1874-1877) and Théorie mathématique de la richesse sociale (1883).

Of his many valuable papers contributed to various periodicals a good bibliography will be found in the Dict. Pol. Econ. (1914). See biographical notice in Economic Journal (March, 1910) by Vilfredo Pareto, his successor in the chair of political economy at Lausanne.

WALRUS, or MORSE (Odobenus rosmarus), a large marine mammal allied to the seals, representing a family by itself. The former word is a modification of the Scandinavian vollross or hvillos ("whale-horse"), the latter an adaptation of the Russian name for the animal. A full-grown male walrus measures from 10 to 11 ft. from the nose to the end of the short tail, and is a heavy, bulky animal, especially thick about the shoulders. The head is rounded, the eyes are rather small, and there are no external ears. The muzzle is short and broad, with, on each side, a group of stiff, bristly whiskers, which become stouter and shorter in old animals. The tall scarcely projects beyond the skin. The fore-limbs are free only from the elbow; the fore-flipper is broad, flat and webbed, the five digits being of nearly equal length, but the first slightly the longest. Each digit has a small flattened nail, situated on the inner surface at a considerable distance from the end. The hind-limbs are enclosed in the skin of the body, almost to the heel. The free portion when expanded is fan-shaped, the two outer toes (first and fifth) being the longest, especially the latter. Flaps of skin project considerably beyond the bones of the toes. The nails of the first and fifth toes are minute and flattened; those of the second, third and fourth elongated, sub-compressed and pointed. The soles of both fore and hind feet are bare, rough and warty. The surface of the skin generally is covered with short, compressed hair of a light yellowish-brown colour, which, on the under parts of the body and base of the flippers, passes into dark reddish-brown or chestnut. In old animals the hair becomes more scanty, sometimes almost disappearing, and the skin shows evidence of the rough life and pugnacious habits of the animal in the scars which it is usually covered. It is everywhere more or less wrinkled, especially over the shoulders, where it is thrown into deep and heavy folds.

One of the most striking characteristics of the walrus is the pair of tusks which descend almost directly downwards from the upper jaw, sometimes attaining a length of 20 in. or more. In the female they are as long or sometimes longer than in the male, but less massive. In the young of the first year they are not visible. These tusks correspond to the canine teeth of other mammals. All the other teeth, including the lower canines, are much alike—small, simple and one-rooted, and with crowns, rounded at first, but wearing to a flat or concave surface. Many of the teeth are lost early, or remain through life in a rudimentary state concealed beneath the gum. The tusks are formidable weapons of defence, but their principal use seems to be scraping and digging among sand and shingle for the molluscs and crustaceans on which the walrus feeds. They are said also to aid in climbing up the slippery rocks and ledges of ice on which so much of the animal's life is passed.

Walruses are more or less gregarious in their habits, being met with generally in companies or herds of various sizes. They are only found near the coast or on large masses of floating ice, and rarely far out in the open sea; and, though often moving from one part of their feeding-ground to another, have no regular migrations. Their young are born between April and June, usually but one at a time, never more than two. Their strong affection for their young, and their sympathy for each other in danger, have been noticed by all who have had the opportunity of observing them in their haunts. When one is wounded the whole herd usually join in defence. Although harmless and inoffensive when not molested, they exhibit considerable fierceness when attacked, using their tusks with tremendous effect either on human enemies who come into too close quarters or on polar bears, the only other adversary they can meet with in their own natural territory. The voice, a loud roaring, which can be heard at a great distance, is described by Dr Kane as "something between the mooing of a cow and the deepest baying of a mastiff, very round and full, with its bark or detached notes repeated rather quickly seven or nine times in succession."

The principal food of the walrus consists of bivalve molluscs, especially Mya truncata and Saxicava rugosa, two species very abundant in the Arctic regions, which it digs up from the mud and sand in which they lie buried at the bottom of the sea by means of its tusks. It crushes and removes the shells by the aid of its grinding teeth and tongue, and swallows only the soft parts of the animal. It also feeds on other molluscs, sand-worms, starfishes and shrimps. Portions of various kinds of seaweed have been found in its stomach, but whether swallowed intentionally or not is doubtful.

The commercial products of the walrus are its oil, hide (used to manufacture harness and sole-leather and twisted into tillerropes) and tusks. The ivory of the latter is, however, inferior in quality to that of the elephant. Its flesh forms an important article of food to the Eskimo and Chukchi. Of the coast tribes of the last-named people the walrus formed the chief means of support.
Walrus colonies are confined to the northern circumpolar regions, extending apparently as far north as explorers have penetrated. On the Atlantic coast of America the Atlantic species was met with in the 16th century as low as the southern coast of Nova Scotia, and in the last century was common in the Gulf of St Lawrence and on the shores of Labrador. It still inhabits the coast round Hudson’s Bay, Davis Strait and Greenland, where, however, its numbers are decreasing. It is not found on the Arctic coast of America between the 97th and 108th meridians. In Europe, occasional stragglers have reached the British Isles, and it was formerly abundant on the coast of Finnmark. It is rare in Iceland, but Spitzbergen, Nova Zembla and the islands of the western part of the north coast of Siberia are constant places of resort. The North Pacific, including both sides of Bering Strait, northern Kamchatka, Alaska and the Pribiloff Islands are also the haunts of numerous walruses, which are isolated from those of the North Atlantic by long stretches of coast in Siberia and North America where they do not occur. The Pacific walrus appears to be as large as, if not larger than, that of the Atlantic; its tusks are longer and more slender, and curve inwards; and the whole general appearance is smaller, relative to size, and broader. These and certain other differences have led to its being considered specifically distinct, under the name of Odo- benus rosmarus. Its habits appear to be similar to those of the Atlantic form. Though formerly found in immense herds, it is becoming scarce, as the methods of destruction used by American whalers are more certain than those of the Chukchi, to whom the walrus long afforded the principal means of subsistence.

Fossil remains of walruses and closely allied animals have been found in the United States, and in England, Belgium and France, in the Miocene and Pliocene strata. (W. F. R. L.)

WALSALL, a market town and municipal, county and parliamentary borough of Staffordshire, England, on the northern edge of the Black Country, and on a tributary stream of the Tame. Pop. (1891) 71,780; (1901) 86,430. It is 120 miles N.W. from London by the London & North-Western railway, on which system it is a centre of several branches, and is served by the Birmingham-Wolverhampton branch of the Midland railway and by canals. The town, though of ancient foundation, is modern in appearance. The central part stands high on a ridge at the northern termination of which is the church of St Matthew, dating in part from the 15th century, but almost wholly rebuilt. The council house and town hall was completed in 1905; there are two theatres, a free library and museum, and an institute of science and art. Recreation grounds include a picturesque arboretum, Reed’s Wood and Palpey Park. Queen Mary’s Schools are a foundation of 1544; here are believed to have been educated John Hough (1561-1743), the president of Magdalen College, Oxford, whom James II. sought to eject from office, afterwards bishop of Oxford, Lichfield, and Worcester; and John, Lord Somers (1651-1716), Lord Keeper and Lord Chancellor of England. The town has large charities, and Walsall was the scene of the charitable work of Sister Dora (Miss Pattison) whom a statue commemorates. Coal, limestone and ironstone are mined in the neighbourhood. The most important products are saddlery and leather-works, horses’ bits and all metal harness fittings: there are iron and brass foundries, and locks, keys, bolts and other hardware are made, both in Walsall and at Bloxwich, a large industrial suburb. Three annual fairs are held. The parliamentary borough returns one member. The town is governed by a mayor, 8 aldermen and 24 councillors. Area, 3,203 acres.

The town is noted for industry, which includes cottons, woollens, and worsteds, and the manufacture of iron and steel goods. Agriculture is of importance, the chief crops being potatoes, turnips, oats and barley.

Walsall (Walsailes, Walsall, Walsal) is included in the list of lands given in 966 to the church of Wolverhampton, which, however, did not retain it long. It was granted by Henry II. to Herbert Ruffus, and Henry III. confirmed it to his grandson (1227). Later the manor passed to the Bassetts and the Beauchamps, and Warwick the King-maker held it in right of his wife. Henry VIII. granted it (1538) to Dudley, afterwards duke of Northumberland. William Ruffus in the reign of John granted it to the burgesses, in consideration of a fine of 12 marks silver and a rent of 12d. for every burbage, all services, customs and secular demands belonging to him and his heirs, except tallage. Henry IV. confirmed to the burgesses a grant of freedom from toll on the ground that Walsall was ancient demesne of the Crown. A mayor and twenty-four brethren who formed the council of the borough are mentioned in 1440, but the earliest charter of incorporation is that of Charles I. (1627), confirmed in 1661, incorporating it under the title of “The Mayor and Commonalty of the Borough and Foreign of Walsall”: under the act of 1853 the town was governed by a mayor, six aldermen and eighteen town councillors. It was not represented in parliament until 1826, when it returned a representative. In 1791 it was known for its manufacture of iron goods and nail-making. In the 18th century the staple industry was the making of shapes and shoe-buckles, and the town suffered when the latter went out of fashion. Two fairs, on Michaelmas day and September 21, were granted in 1399. The Tuesday market, which is still held, and two fairs on October 28 and May 6, were granted in 1417 to Richard Beauchamp, earl of Warwick. See Victoria County History, Stafford; E. L. Grew, History of the Borough and Foreign of Walsall (1650).

WALSH, JOHN HENRY (1836-1888), English writer on sport under the pseudonym of “Stonehenge,” was born at Hackney, London, on the 21st of October 1810. He was educated at private schools, and became a fellow of the Royal College of Surgeons in 1844. For several years he followed his profession of surgeon, but gradually abandoned it on account of the success of his works on the subject of sport. He removed from the country to London in 1852, and the following year brought out his first important book, The Greyhound (3rd ed. 1873), a collection of papers originally contributed to “Bell’s Life.” In 1866 appeared his Manual of British Rural Sports, which enjoyed many editions. During the same year he joined the staff of The Field, and became its editor at the close of 1857. Among his numerous books published under the name of “Stonehenge” are The Shot-Gun and Sporting Rifle (1859), The Dog in Health and Disease (1859; 4th ed. 1887), The Horse in the Stable and in the Field (1861; 13th ed. 1890), Dogs of the British Isles (1867; 3rd ed. 1885), The Modern Sportsman’s Gun and Rifle (1882-1884). While editor of The Field Walsh instituted a series of trials of guns, rifles and sporting powders extending over a period of many years, with great tend to the development of sporting firearms, and his influence upon all branches of sport was stimulating and beneficial. He died at Putney on the 12th of February 1888.

WALSH, PETER [Valesius] (c. 1618-1688), Irish politician and controversialist, was born at Mooretown, co. Kildare, and studied at Louvain, where he joined the Franciscans and acquired Jansenist sympathies. In 1646 he went to Kilkenny, then in the hands of the rebel “confederate Catholics,” and, in opposition to the papal nuncio Riuicini, urged, and in 1649 helped to secure, peace with the viceroy Ormonde. Persecuted from this time by the irreconcilable supporters of the papal claims, and even in danger of death, after Cromwell’s conquest of Ireland he lived obscurely in London and abroad. On the restoration he urged his patron Ormonde to support the Irish Roman Catholics as the natural friends of royalty against the sectarists, and endeavoured to mitigate their lot and efface the impression made by their successive rebellions by a loyal remonstrance to Charles II., boldly repudiating papal infallibility and interference in public affairs, and affirming undivided allegiance to the crown. For eight years he canvassed for signatures to this address, but in spite of considerable support the strong opposition of the Jesuits and Dominicans deterred the clergy and nearly wrecked the scheme. From 1669 until his death he lived in London, much respected for his honesty, loyalty and learning. Excommunicated by the Franciscan chapter-general in 1670, he remained a devout adherent of his church, although he maintained friendly relations with the Anglicans, accepting their orders and attending their churches. He made a full submission to Rome before his death, though the fact has been questioned. He wrote (1672-1684) a series of controversial letters against Pope Gregory VII’s doctrine of papal supremacy over princes;
a voluminous History of the Remonstrance (1674); Hibernia (1682), a worthless history of Ireland; in 1686 a reply to the Popery of Thomas Barlow (1607-1691), bishop of Lincoln; and other works. In these writings he consistently upheld the doctrine of civil liberty against the pretensions of the papacy.

Sir Francis's love of literature led him to contribute to and edit several works himself. His History of the Great Civil War; or, Burnet, History of his own Times, i. 195; T. Carte, Life of Ormonde (new ed. 1851); Dict. Nat. Biog. ix.

WALSH, WILLIAM (1663-1708), English poet and critic, son of Joseph Walsh of Abberley, Worcestershire, was born in 1663. He entered Wadham College, Oxford, as a gentleman commoner in 1678. Leaving the university without a degree, he retired in 1681, and was returned M.P. for Worcester in 1698, 1701 and 1702. In 1705 he sat for Richmond, Yorkshire. On the accession of Queen Anne he was made "gentleman of the horse," a post which he held till his death, noted by Narcissus Luttrell on the 18th of March 1708. He wrote a Dialogue concerning Women, being a Defence of the Sex (1691), addressed to "Eugenia"; and Letters and Poems, Amorous and Gallant (preface dated 1692, printed in Jonson's Miscellany, 1716, and separately, 1736), love lyrics designed, says the author, to impart to the world "the faithful image of an amorous heart. It is not a galley for sale as an enchanted rose." Pope that Walsh is remembered. Pope's Pastoral Seasons were submitted for his criticism by Wycherley in 1675, and Walsh then entered on a direct correspondence with the young poet. The letters are printed in Pope's Works (ed. Elwin and Courtthope, vi. 49-60). Pope, who visited him at Abberley in 1707, set great value upon his opinion. "Mr Walsh used to tell me," he says, "that there was one way left of excelling; for though we had several great poets, we never had any one great poet that was correct, and he desired me to make that my study and my aim." The excessive eulogy accorded him by Dryden and Pope to Walsh must be accounted for partly on the grounds of personal friendship. The life of Virgil prefixed to Dryden's translation, and a "Preface to the Pastoral" with a short defence of Virgil, against some of the reflections of Monsieur Fontenelle," both ascribed at one time to Walsh, were the work of Dr Knightly Cchetwood (1650-1720). In 1704 Walsh collaborated with Sir John Vanbrugh and William Congreve in Menrile de Pour-ceagnac, or Squire Trelouby, an adaptation of Molière's farce. Walsh's Poems are included in Anderson's Miscellaneous Poems, the British Poets. See The Lives of the Poets, vol. iii. pp. 151 et seq., published 1753 as by Theophilus Cibber.

WALSHINGHAM, SIR FRANCIS (c. 1530-1590), English statesman, was the only son of William Walsingham, common sergeant of London (d. March 1534), by his wife Joyce, daughter of Sir Edmund Denny of Cheshunt. The family is assumed to have sprung from Walsingham in Norfolk, but the earliest authentic traces of it are found in London in the first half of the 15th century; and the list of his ancestors is long and distinguished. Walsingham was educated at Eton and Christ Church, Oxford, and was called to the bar. In 1556 he was one of the heads admitted "counsel" in the faculty of laws. Returning to England after Elizabeth's accession he was elected M.P. for Banbury to her first parliament, which sat from January to May 1559. He married in January 1562 Anne, daughter of George Barnes, Lord Mayor of London and widow of Alexander Carleil, whose son-in-law Christopher Hoddesdon was closely associated with maritime and commercial enterprise. He was elected to represent Lyme Regis in Elizabeth's second parliament of 1563 as well as for Banbury, and preferred to sit for the former borough. He may have owed his election to Cecil's influence, for to Cecil he subsequently attributed his rise to power; but his brother-in-law Sir Walter Mildmay was well known at court and in 1566 became chancellor of the exchequer. In that year Walsingham married a second time, his first wife having died in 1564; his second was also a widow, Ursula, daughter of Henry St Barbe and widow of Sir Richard Worsley of Appuldurcombe, captain of the Isle of Wight. Her sister Edith married Robert Beale, afterwards the chief of Walsingham's henchmen. By his second wife Walsingham had a daughter who married firstly Sir Philip Sidney, secondly Robert Devereux, second earl of Essex, and thirdly Richard de Burgh, earl of Claricarre.

Walsingham's earliest extant communications with the government date from 1558, and in that and the following two years he was supplying Cecil with information about the movements of foreign spies in London. The Spanish ambassador in Paris declared in 1590 that he had been for two years engaged in collecting contributions from English churches for the assistance of the Huguenots in France; and he drew up a memorial denouncing the danger of the enterprise. In England and abroad, the project, was together with the Huguenot enterprise, was a great interest of Walsingham's, and he united both interests in his policy. Ridolfo, the conspirator, was committed to his custody in October 1560, and seems to have deluded Walsingham as to his intentions; but there is inadequate evidence for the statement (Dict. Nat. Biog.) that Walsingham was already organizing the secret police of London. In the summer of 1570 he was, in spite of his protestations, designated to succeed Norris as ambassador at Paris. La Mothe Fénélon, the French ambassador in England, wrote that he was thought a very able man, devoted to the new religion, and very much in Cecil's secrets. Cecil had in 1560 triumphed over the conservative and aristocratic party in the council; and Walsingham was the ablest of the new men whom he brought to the front to give play to the new forces which were to carve out England's career.

An essential element in the new policy was the destabilization of an alliance with France for the old Burgundian friendship. The affair of San Juan de Ulu and the seizure of the Spanish treasure-ships in 1568 had been omens of the inevitable conflict with Spain; Ridolfo's plot and Philip II's approaches to Mary Stuart indicated the lines upon which the struggle would be fought; and it was Walsingham's business to reconcile the nation with the French government, and upon this reconciliation to base an Anglo-French alliance which might lead to a grand attack on Spain, to the liberation of the Netherlands, to the destruction of Spain's monopoly in the New World, and to making Protestantism the dominant force in Europe. Walsingham threw himself heart and soul into the movement. He was the anxious fanatical of Elizabeth's advisers; he lacked the patience of Burghley and the cynical coolness of Elizabeth. His devotion to Protestantism made him feverishly alive to the perils which threatened the Reformation; and he took an alertist view of every situation. Ever dreading a blow, he was always eager to strike the first; and alive to the perils of peace, he was blind to the dangers of war. He supplied the momentum which was necessary to counteract the caution of Burghley and Elizabeth; but it was probably fortunate that his headstrong counsels were generally overruled by the circumspection of his sovereign. He would have plunged England into war with Spain in 1572, when the risks would have been infinitely greater than in 1588, and when the Huguenot influence over the French government, on which he relied for support, would probably have broken in his hands. His clear-cut, strenuous policy of open hostility has always had its admirers; but it is difficult to see how England could have secured from it more than she
actually did from Elizabeth's more Fabian tactics. War, declared before England had gained the naval experience and wealth of the next fifteen years, and before Spain had been weakened by the struggle in the Netherlands and the depredations of the sea-rovers, would have been a desperate expedient; and the ideas that any action on Elizabeth's part could have made France Huguenot, or prevented the disruption of the Netherlands, may be dismissed as the idle dreams of Protestant enthusiasts.

Walsingham, however, was an accomplished diplomatist, and he reserved these turbulent opinions for the ears of his own government, incurring frequent rebukes from Elizabeth. In his professional capacity, his attitude was correct enough; and, indeed, his anxiety for the French alliance and for the marriage between Elizabeth and Anjou led him to suggest concessions to Anjou's Catholic susceptibilities which came strangely from so staunch a Puritan. Elizabeth did not mean to marry, and although a defensive alliance was concluded between England and France in April 1572, the French government perceived that public opinion in France would not tolerate an open breach with Spain in Protestant interests. Coligny's success in captivating the mind of Charles IX. infuriated Catherine de Médicis, and the prospect of France being dragged at the heels of the Huguenots infuriated the Catholics. The result was Catherine's attempt on Coligny's life and then the massacre of St Bartholomew, which placed Walsingham's person in jeopardy and ruined for the time all hopes of the realization of his policy of an Anglo-French alliance.

He was recalled in April 1573, but the queen recognized that the failure had been due to no fault of his, and eight months later he was admitted to the privy council and made joint secretary of state with Sir Thomas Smith. He held this office jointly or solely until his death; in 1577 when Smith died, Dr Thomas Wilson was associated with Walsingham; after Wilson's death in 1581 Walsingham was sole secretary until July 1586, when Davison began his brief and ill-fated seven months' tenure of the office. After Davison's disgrace in February 1587 Walsingham remained sole secretary, though Wolley assisted him as Latin secretary from 1588 to 1590. He was also returned to parliament at a by-election in 1576 as knight of the shire for Surrey in succession to Charles Howard, who had become Lord Howard of Effingham, and he was re-elected for Surrey in 1584, 1586 and 1588. He was knighted on December 1, 1577, and made chancellor of the order of the Garter on April 22, 1578.

As secretary, Walsingham could pursue no independent policy; he was rather in the position of permanent under-secretary of the combined home and foreign departments, and he had to work under the direction of the council, and particularly of Burghley and the queen. He continued to urge the necessity of more vigorous intervention on behalf of the Protestants abroad, though now his clients were the Dutch rather than the Huguenots. In June 1578 he was sent with Lord Cobham to the Netherlands, mainly to glean reliable information on the complicated situation. He had interviews with the prince of Orange, with Casimir who was there in the interests of Protestant Germany, with Anjou who came in his own interests or in those of France, and with Don John, who nominally governed the country in Philip's name; the story that he instigated a plot to kidnap or murder Don John is without foundation. His letters betray discontent with Elizabeth's reluctance to assist the States; he could not understand her antipathy to rebellious subjects, and he refused in October, having accomplished little.

In August 1581 he was sent on a second and briefer mission to Paris. Its object was to secure a solid Anglo-French alliance against Spain without the condition upon which Henry III. insisted, namely a marriage between Elizabeth and Anjou. The French government would not yield, and Walsingham came back, to be followed by Anjou who sought in personal interviews to overcome Elizabeth's objections to matrimony. He, too, was unsuccessful; and a few months later he was dismissed with some English money and ostensible assurances of support. But secretly Elizabeth countermanded his plans; unlike Walsingham, she would sooner have seen Philip remain master of the Netherlands than see them fall into the hands of France. His final embassy was to the court of James VI in 1583, and here his vehement and suspicious Protestantism led him astray and provoked him into counterworking the designs of his own government. He was convinced that James was as hostile to Elizabeth as Mary herself, and failed to perceive that he was as much a Jesuit as a proponent of the union. Walsingham and Burghley were inclined to try an alliance with the Scottish king, and the event justified their policy, which Walsingham did his best to frustrate, although deserted on this occasion by his chief regular supporter, Leicester.

For the rest of his life Walsingham was mainly occupied in detecting and frustrating the various plots formed against Elizabeth's life; and herein he achieved a success denied him in his foreign policy. He raised the English system of secret intelligence to a high degree of efficiency. At one time he is said to have had in his pay fifty-three agents at foreign courts, besides eighteen persons whose functions were even more obscure. Some of them were double spies, sold to both parties, whose real sentiments are still conjectural; but Walsingham was more successful in seducing Catholic spies than his antagonists were in seducing Protestant spies, and most of his information came from Catholics who betrayed one another. In his office in London they were trained in the arts of deciphering correspondence, feigning handwriting, and of breaking and repairing seals in such a way as to avoid detection. His spies were naturally doubtful about any policy, because the profession does not attribute any morality of methods can no more be expected from counterploters than from plotters; and the prevalence of political or religious assassination made counterplot a necessity in the interests of the state.

The most famous of the plots frustrated by Walsingham was Anthony Babington's, which he detected in 1586. Of the guilt of the main conspirators there is no doubt, but the complicity of Mary Stuart has been hotly disputed. Walsingham had long been convinced, like parliament and the majority of Englishmen, of the necessity of removing Mary; but it was only the discovery of Babington's plot that enabled him to bring pressure enough to bear upon Elizabeth to ensure Mary's execution. This circumstance has naturally led to the theory that he conceived, if not the plot, at least the proofs of Mary's connivance. Undoubtedly he facilitated her self-incrimination, but of her active encouragement of the plot there can be little doubt after the publication of her letters to Mendoza, in which she excuses her complicity on the plea that no other means were left to secure her liberation. Considering the part he played in this transaction, Walsingham escaped the vengeance which the queen with calculated indignation inflicted upon Babington.

Walsingham died deeply in debt on April 6, 1590. Since 1576 he had lived mainly at Barn Elms, Barnes, maintaining an adequate establishment; but his salary did not cover his expenses, he was burdened with his son-in-law Sir Philip Sidney's debts, and he obtained few of those perquisites which Elizabeth lavished on her favourites. He had little of the courtier about him; his sombre temperament and directness of speech irritated the queen, and it says something for both of them that he retained his confidence and his office until the end of his life.

Dr Karl Stäglich's elaborate and scholarly Sir Francis Walsingham (Die Zeit [Heidelberg, 1926]), which gives the first full accounts of Walsingham so far as it goes (1573); Dr Stäglich has also dealt with the early history of the family in his Die Walsingham bis zur Mitte des 16. Jahrhunderts (Heidelberg, 1925). The letters of Walsingham's correspondence are preserved in the Record Office and the British Museum; some have been epitomized in the Foreign Calendar (as far as 1582); and his correspondence during his two missions to France was published in extenso by Sir Dudley Digges in 1658 under the title The Compleat Ambassador, possibly, as has been suggested by Dr Stäglich, to give a filip to the similar policy then being pursued by the French government. The ascription to Sir Francis of Archival Tics: or Walsingham's Manual of Prudential Maxims for the Statesman and the Courtier is erroneous; the book is really the translation of a French treatise by one Edward Walsingham who flourished c. 1643-1656. See also Webb, Miller and Beckwith's History of Chislehurst (1899) and Dict. Nat. Biog. lix. 231-240.
Mr Conyers Read, who edited the Bardon Papers ("Camen", ser. 1905), relating to Mary's trial, was in 1910 engaged on an elaborate life of Walsingham, part of which the present writer was asked to see in MS.

WALSINGHAM, THOMAS (d. c. 1422), English chronicler, was probably educated at the abbey of St Albans and at Oxford. He became a monk at St Albans, where he appears to have passed the whole of his monastic life except the six years between 1394 and 1400 during which he was prior of another Benedictine house at Wymondham, Norfolk. At St Albans he was in charge of the scriptorium, or writing room, and he died about 1422. Walsingham's most important work is the Historia Anglorum, a valuable picture of English history between 1272 and 1419, but some authorities hold that Walsingham himself only wrote the section between 1377 and 1392, but this view is controverted by James Gairdner in his Early chroniclers of Europe (1879).

The Historia, which from the beginning to 1377 is largely a compilation from earlier chroniclers, was published by Matthew Parker in 1574 as Historia Angliae brevis. For the "Rolls" series it has been edited in two volumes by H. T. Riley (1863-1864). Covering some of the same ground Walsingham wrote a Chronicon Angliae; this deals with English history from 1328 to 1388 and has been edited by Sir E. P. W. Lewis. The "Rolls" series of Welsh manuscripts include the Gesta abbatum monasterii S. Albanii and the Ypodigma Neustriae. The Gesta is a history of the abbots of St Albans from the foundation of the abbey to 1328, while the Ypodigma Neustriae is a record of the work of the archbishop of Canterbury from 1272 and 1381, the earlier part being merely a compilation; it has been edited for the "Rolls" series by H. T. Riley (1867-1869). The Ypodigma purports to be a history of the dukes of Normandy. But the original work of Walsingham has been lost, and his personal authority is not great. Compiled about 1419, it was dedicated to Henry V. and was written to justify this king's invasion of France. It was first published by Matthew Parker in 1574, and has been edited for the "Rolls" series by H. T. Riley (1876). Another history of England by Walsingham dealing with the period between 1272 and 1393 is in manuscript in the British Museum. This agrees in many particulars with the Chronicæ Anglice, but it is much less hostile to John of Gaunt, duke of Lancaster. Walsingham is the main authority for the history of England during the reigns of Richard II., Henry IV., and Henry V., including the rising under Wat Tyler in 1381. He shows considerable animus against John Wycliffe and the Lollards.

WALTER, HUBERT (d. 1203), chief justice of England and archbishop of Canterbury, was a relative of Ranulf de Glanvill, the great justiciar of Henry II., and rose under the eye of his kinsman to an important position in the Curia Regis. In 1184 and in 1185 he appears as a baron of the exchequer. He was employed, sometimes as a negotiator, sometimes as a justice, sometimes as a royal secretary. He received no clerical promotion from Henry II., but Richard I. appointed him bishop of Salisbury, and by Richard's command he went with the third crusade to the Holy Land. He gained the respect of all the crusaders, and acted as Richard's principal agent in all negotiation. He is always being given a place in the first band of pilgrims that entered Jerusalem. He led the English army back to England after Richard's departure from Palestine; but in Sicily he heard of the king's captivity, and hurried to join him in Germany. In 1193 he returned to England to raise the king's ransom. Soon afterwards he was elected archbishop of Canterbury and made justiciar. He was very successful in the government of the kingdom, and after Richard's last visit he was practically the ruler of England. He had no light task to keep pace with the king's constant demands for money. He was compelled to work the administrative machinery to its utmost, and indeed to invent new methods of extortion. To pay for Richard's ransom, he had already been compelled to tax personal property, the first instance of such taxation for secular purposes. The main feature of all his measures was the novel and extended use of representation and election for all the purposes of government. His chief measures are contained in his instruction to the itinerant justices of 1194 and 1198, in his ordinance of 1195 for the conservation of the peace, and in his scheme of 1198 for the assessment of the carucage. The justices of 1194 were to order the election of four constables by the chief persons of the county. These constables were to "keep," i.e. to register, the pleas of the crown, an important duty hitherto left to the sheriff. The juries, both for answering the questions asked by the judges and for trying cases under the grand assize, were to be chosen by a committee of four knights, also elected by the suitors of each county court for that purpose. In 1195 Hubert issued an ordinance by which four knights were to be appointed in every hundred to act as guardians of the peace, and from this humble beginning eventually was evolved the office of justice of the peace. His reliance upon the knights, or middle-class landowners, who now for the first time appear in the political foreground, is all the more interesting because it is this class who, either as members of parliament or justices of the peace, were to have the effective rule of England in their hands for so many centuries. In 1198, to satisfy the king's demand for money, Hubert demanded a carucage or plough-tax of five shillings on every plough-land (carucate) under cultivation. This was the old tax, the Danegeld, in a new and heavier form and there was great difficulty in levying it. To make it easier, the justiciar ordered the assessment to be made by a sworn jury in every hundred, and one may reasonably conjecture that these jurors were also elected. Besides these important constitutional changes Hubert negotiated a peace with Scotland in 1195, and in 1197 another with the Welsh. But Richard had grown dissatisfied with him, for the carucage had not been a success, and Hubert had failed to overcome the resistance of the Great Council when its members refused to equip a force of knights to serve abroad. In 1198 Hubert, who had inherited from his predecessors in the primacy a fierce quarrel with the Canterbury monks, gave these enemies an opportunity of complaining to the pope, for in 1193 Hubert had committed an act of sacrilege in Bow Church, which belonged to the monks. The pope asked Richard to free Hubert from all secular duties, and he did so, thus making the demand an excuse for dismissing Hubert from the justiciarship. On the 27th of May 1199 Hubert crowned John, making a speech in which the old theory of election by the people was enunciated for the last time. He also took the office of chancellor and cheerfully worked under Geoffrey Fitz Peter, one of his former subordinates. In 1201 he went on a diplomatic mission to Philip Augustus of France, and in 1202 he returned to England to keep the king in peace while John was losing his continental possessions. In 1205 he died. Hubert was an ingenuous, original and industrious public servant, but he was grasping and perhaps dishonest.

WALTER, JOHN (1738-1812), founder of The Times newspaper, London, was born in 1738/9, probably in London, and from the death of his father, Richard Walter (about 1735/6), merchant, as a second child. In 1749, aged 17, he was apprenticed as a merchant. He played a leading part in establishing a Coal Exchange in London; but shortly after 1761, when he began to occupy himself solely as an underwriter and became a member of Lloyd's, he over-specified and failed. In 1782 he bought from one Henry Johnson a patent for a new method of printing from "logotypes" (i.e. fonts of words or portions of words, instead of letters), and made some improvements in it. In 1784 he acquired an old printing office in Blackfriars, which formed the nucleus of the Printing-house Square of a later date, and established there his Logographic Office. At first John only undertook the printing of booklets, but on 1st January 1785 he started a small newspaper called The Daily Universal Register, which on reaching its 400th number on 1st January 1788 was renamed The Times. The printing business developed and prospered, but the newspaper at first had a somewhat chequered career. In 1789 Mr Walter was tried for a libel in it on the duke of York, and was sentenced to a fine of £50, a year's imprisonment in Newgate, to stand in the pillory for an hour and to give surety for good behaviour for seven years; and for further libels the fine was increased by £100, and the imprisonment extended. On 20th March 1791, however, he was released and pardoned. In 1799 he was again convicted for a technical libel, this time on Lord Cowper. He had then given
up the management of the business to his eldest son, William, and had (1795) retired to Teddington, where he died, 10th November 1812. In 1759 he had married Frances Landen (died 1788), by whom he had six children. William Walter very soon gave up the duties he undertook in 1795, and in 1803 transferred the sole management of the business to his younger brother, John.

John Walter (2) (1776-1847), who really established the great newspaper of which his father had sown the seed, was born on the 23rd of February 1776, and was educated at Merchant Taylors' School and Trinity College, Oxford. About 1798 he was associated with his elder brother in the management of his father's business, and in 1803 became not only sole manager but also editor of The Times. The second John Walter was a very remarkable man, the details of whose practice would be extremely interesting if we could recover them. But the conditions of newspaper work at that time, together with the natural reticence of one born to do, not to talk about doing, drew over his operations a veil of secrecy which there are now no means of penetrating. His greatness must be measured by the work he did. He found The Times one of a number of unconsidered journals whose opinions counted for little, and whose intelligence lagged far behind official reports, the accuracy of which they had no independent means of checking. He found it unregarded by the great except when a stringent law of libel enabled them to inflict vindictive punishment in the pillory and in prison for what in our days is ordinary political criticism. He left it in 1847 a great and influential paper. Walter's opinion was delivered to the European public throughout Europe, consulted and courtey by cabinet ministers at home, and in intimate relations with the best sources of independent information in every European capital. The man who, alone among contemporaries of older standing and with better opportunities, raised a struggling newspaper to a position such as no other journal has ever attained or is likely to attain in future, needs no further attestation of his exceptional ability and character. The secret of an achievement of that unique kind is incomprehensible. Yet we may note some at least of the elements of John Walter's monumental success. From his father he inherited a fearless and perhaps slightly aggressive independence, to which he joined a steady and tireless energy and a concentration of purpose which are less conspicuous in his father's career. He had been associated with his brother in the management of the paper for five years before he took entire control and became his own editor in 1803. In the same year he signalized the new spirit of the direction by his opposition to Pitt, which cost him the withdrawal of government advertisements and the loss of his appointment as printer to the Customs, besides exposing him to the not too scrupulous hostility of the official world. These were undoubtedly serious discouragements in the circumstances of that day. In John Walter's way of meeting them we find a principle upon which he consistently acted through life, and which goes far to explain his success. He never allowed himself to be diverted from the pursuit of a great though distant object by any petty calculation of immediate gain or loss. He had set himself to build up a journal which all the world should recognize as independent of government favour, and which governments themselves should be compelled to respect and reckon with. He was not going to barter that splendid field of titanic ideas for a few days' mess of pottage, or allow the government do its worst and hold on his way. At times the way must have been hard and the anxiety great, but great also was the reward. For the public in ever-widening circles received assurance, in an age of considerable literary and political servility, of a man who could not be bought, and a newspaper that could be neither hoodwinked nor terrorized. His determination to avoid even the appearance of being amenable to influence was forcibly illustrated when the king of Portugal sent him, through the Portuguese ambassador, a service of gold plate. It was a princely gift, and a flattering testimonio of the European reputation and authority of his newspaper. Mr Walter promptly returned it, courteously recognizing the honourable motives of the giver, but stating that to accept the gift would place him under a sense of obligation incompatible with the perfect independence of thought and action which he desired to maintain. It was the same jealous regard for the complete independence of The Times that led him to insist, as he did with remarkable success, upon the strict anonymity of the able men whom he selected with the eye of a general to act as his coadjutors. From about 1810 he delegated to other editorial supervision, first to Sir John Stoddart, then to Thomas Barnes, and in 1827 to T. J. Delahaye, though never the supreme direction of policy. Their influence was essentially due to the fact that they had a great newspaper behind them, and behind the great newspaper was the remarkable man who made it, and never ceased from giving it inspiration and direction. To unassailable independence, inflexible integrity and sure sagacity he added complete business knowledge of details, a sound judgment of men and things, and untiring energy in the pursuit of excellence in literary quality, in typography (see Printing, in mechanical appliances, and in the organization for the collection of news. These are the things that went to the making of The Times, and the measure of the greatness of the second John Walter is that he supplied them all. In 1832 Mr Walter, who had purchased an estate called Bear Wood, in Berkshire (where his son afterwards built the present house), was elected to Parliament for that county, and retained his seat till 1837. In 1841 he was returned to Parliament for Nottingham, but was unseated next year on petition. He was twice married, and by his second wife, Mary Smythe, had a family. He died in London on the 28th of July 1847. John Walter's younger son, born at Printing-house Square in 1818, and was educated at Eton and Exeter College, Oxford, being called to the bar in 1847. On leaving Oxford he took part in the business management of The Times, and on his father's death became sole manager, though he devoted part of the work on Mr Mowbray Morris. He was a man of scholarly tastes and serious religious views, and his conscientious character had a marked influence on the tone of the paper. It was under him that the successive improvements in the printing machinery, begun by his father in 1814, at last reached the stage of the "Walter Press" in 1869, the pioneer of modern newspaper printing-presses. In 1847 he was elected to Parliament for Nottingham as a moderate Liberal, and was re-elected in 1852 and in 1857. In 1859 he was returned for Berkshire, and though defeated in 1866, was again elected in 1868, and held the seat till he retired in 1885. He died on the 3rd of November 1894. He was twice married, first in 1842 to Emily Frances Court (d. 1858), and secondly in 1861 to Flora Macnab. His eldest son by the first marriage, John, was accidentally drowned at Bear Wood in 1870; and he was succeeded by Mr Arthur Franklin Walter (1840-1916), his second son by the first marriage. Mr A. F. Walter remained lifelong proprietor of The Times till 1908, when it was converted into a company. He then became chairman of the board of directors, and on his death was succeeded in this position by his son John.

See Newspapers: Modern London Newspapers (The Times), for the history of the paper.

WALTER, LUCY (c. 1630-1638), mistress of the English king Charles II. and reputed mother of the duke of Monmouth (q.v.), is believed to have been born in 1630, or a little later, at Roch Castle, near Haverfordwest. The Walters were a Welsh family of considerable standing, who were active in the Civil War. Roch Castle having been captured and burned by the parliamentary forces in 1644, Lucy Walter found shelter first in London and then at the Hague. There, in 1648, she met the future king, possibly renewing an earlier acquaintance. There is little reason for believing the story that she was his first mistress; it is certain that he was not her first lover. The intimacy between him and this "brown, beautiful, bold but insipid creature," as John Evelyn calls her, who chose to be known as Mrs Barlow (Barlo) lasted with intervals till the autumn of 1651, when Charles claimed the paternity of the child born in 1649, whom he subsequently created duke of Monmouth. A daughter, Mary (b. 1651), of whom the reputed father was Henry Bennet, earl of Arlington, married William Sansfield,
brother of Patrick Sarsfield, earl of Lucan. On the termination of her connexion with Charles II., Lucy Walter abandoned herself to a life of prodigal living and immorality, which resulted in her premature death, at Paris, in 1638. Her name is often wrongly written Walters or Waters.

WALTER OF COVENTRY (fl. 1290), English monk and chronicler, who was apparently connected with a religious house in the province of York, is known to us only through the historical compilation which bears his name, the Memorialis fratriis Waleri de Coventria. The word Memorialis is usually taken to mean "commonplace book." Some critics interpret it in the sense of "a souvenir," and argue that Walter was not the author but merely the donor of the book; but the weight of authority is against this view. The author of the Memorialis lived in the reign of Edward I., and mentions the homage done to Edward as overlord of Scotland (1291). Since the main narrative extends only to 1225, the Memorialis is emphatically a second-hand production. But for the years 1201-1225 it is a faithful transcript of a contemporary chronicle, the work of a Barnwell canon. A complete text of the Barnwell work is preserved in the College of Arms (Heralds' College, MS. 10) but has never yet been printed, though it was collated by Bishop Stubbs for his edition of the Memorialis. The Barnwell annalist, living in Cambridgeshire, was well situated to observe the events of the barons' war, and is our most valuable authority for that important crisis. He is less hostile to John than are Ralph of Coggeshall, Roger of Wendoro and Matthew Paris. He praises the king's management of the Welsh and Scotch wars; he is critical in his attitude towards the pope and the English opposition; he regards the submission of John to Rome as a skilful stroke of policy, although he notes the fact that some men called it a humiliation. The constitutional agitation of 1215 does not arouse his enthusiasm; he passes curtly over the Runnymede conference, barely mentions Magna Carta, and blames the barons for the resumption of war. It may be from this that the annalist avoids talking John, but it is more probable that the middle classes, whom he represents, regarded the designs of the feudal baronage with suspicion.

WALTERSHAUSEN, WOLFGANG SARTORIUS, BARON VON (1800-1876), German geologist, was born at Göttingen, on the 17th of December 1800, and educated at the university in that city. There he devoted his attention to physical and natural science, and in particular to mineralogy. During a tour in 1834-1835 he carried out a series of magnetic observations in various parts of Europe. He then gave his attention to an exhaustive investigation of Etna, and carried on the work with some interruptions until 1843. The chief result of this undertaking was his great Atlas der Etna (1858-1861), in which he distinguished the lava streams formed during the later centuries. After his return from Etna he visited Iceland, and subsequently published Physikalische Skizze von Island (1842), Über die vulkanischen Gesteine in Sicilien und Island (1853), and Geologischer Atlas von Island (1853). Meanwhile he was appointed professor of mineralogy and geology at Göttingen, and held this post for about thirty years, until his death. In 1866 he published an important essay entitled Recherches sur les climats de l'époque actuelle et des époques anciennes; in this he expressed his belief that the Glacial period was due to changes in the configuration of the earth's surface. For this he gained the Geologiseh Schulenburg.

WALTHAM, a city of Middlesex county, Massachusetts, U.S.A., on both banks of the Charles river, about 10 m. W. of Boston. Pop. (1890) 18,707; (1900) 23,481, of whom 6695 were foreign-born; (1910 census) 27,834. Waltham is served by the Boston & Maine railway, and by electric interurban lines connecting with Boston, Lowell, Lexington, Watertown and Newton. It is situated on a series of rugged hills rising from the river. Prospect Hill (485 ft.) commands a magnificent view. A tract of 100 acres, comprising this hill and an adjoining elevation, has been set aside as a public park by the city; and there are four playgrounds (total area, 62 acres) and, in the centre of the city, a large common. In Waltham are some 43 acres of the Beaver Brook Reservation and 40 acres of the Charles River Reservation of the Metropolitan park system; in the former are the famous "Waverley Oaks." The Gore Mansion, erected towards the close of the 18th century by Christopher Gore (1758-1829), a prominent lawyer and Federalist leader, governor of Massachusetts in 1809-1810, and a member of the United States Senate in 1814-1817, is a stately country house surrounded by extensive grounds. Among the fine old oaks and elms. Above the city the Charles river is famous as a canoeing stream, and there is an annual canoe carnival between Waltham and Riverside, one of the most popular resorts in the neighbourhood of Boston. The city has a good public library (about 35,000 volumes in 1910). Its principal buildings are a state armory, and the First Parish (Unitarian), Christ (Protestant Episcopal), the Swedenborgian, the First Baptist and Beth Eden (Baptist) churches. Waltham is the seat of the Massachusetts School for the Feeble-minded (established in Boston in 1848), the first institution of its sort in the country, and of the Waltham Training School for Nurses (through the generosity of Mrs. Abbie S. Leland). Waltham is a noted manufactory of "day nursing" (outside of hospital wards) on the present plan, of the Convent of Notre Dame and the Notre Dame Normal Training School (Roman Catholic), of the New Church School (New Jerusalem Church), of two business schools, and the Waltham Horological School (1879), a school for practical watchmaking and repairing; here also are the Waltham Hospital (1889), the Baby Hospital (1902) and the Leland Home (1879) for aged women. In 1905 the city's factory product was valued at $7,199,697 (21% more than in 1900). The largest single article manufactured was that of the American Waltham Watch Company, which has here the largest watch factory in the world, with an annual production of about a million watches. Watch and clock materials were valued at $123,885 in 1905. In 1905 cotton goods were second in value to watches; and third were foundry and machine-shop products ($516,607). Other products are automobiles, wagons and carriages, bicycles, canoes, organs and enamelled wood.

The first white settlement was made about 1630 and in 1637 became the Middle Precinct of Watertown. In 1738 the township of Waltham was separately organized. At various times it was part of the town of Weston, part of Cambridge, and part of Newton. In 1755 it was incorporated as a town, and in 1841 its western portion was known as Waltham West. In 1879 one of its precincts was set off to form part of the new township of Belmont. In 1884 Waltham was chartered as a city. The first power mill for the manufacture of cotton cloth in the United States was established here in 1814 as an experiment by the company which built the mills and the city of Lowell. Waltham became an important manufacturing city in the decade before the American Civil War, when the company which in 1835 made the first American machine-made watches moved hither from Roxbury and established the Waltham watch industry. This watch company, before the establishment of the U.S. Observatory at Washington and the transmission thence of true time throughout the country by electric telegraph, had an elaborate observatory for testing and setting its watches.

WALTHAM ABBEY, or WALTHAM HOLY CROSS, a market town in the Epping parliamentary division of Essex, England, on the Lea, and on the Cambridge branch of the Great Eastern railway, 13 m. N. by E. from London. Pop. of urban district of Waltham Holy Cross (1901) 6549. The neighbouring county of Essex is flat and uninteresting, but to the E. and N.E. of the town the hills rise in the direction of Hainault and Epping Forests. Of the former magnificent cruciform abbey church the only portion of importance now remaining is the nave, forming the present parish church, the two easternmost bays being converted into the chancel. It is a very fine specimen of ornate Norman work. Only the western supports of the ancient tower now remain. A tower corresponding with the present size of the church was
erected in 1536 and restored in 1798. On the south side of the church is a lady chapel dating from the end of the reign of Edward II. or the beginning of that of Edward III., containing some good Decorated work, with a crypt below. Of the monastic buildings there remain only a bridge and gateway and other slight fragments. Bishop Hall became curate of Waltham in 1612, and Thomas Fuller was curate from 1648 to 1658. At Waltham Cross, about 1 m. W. of Waltham in Hertfordshire, is the beautiful cross erected (1291-1294) by Edward I. at one of the resting-places of the corpse of Queen Eleanor on its way to burial in Westminster Abbey. It is of Caen stone and is supposed to have been designed by Pietro Cavallini, a Roman sculptor. It is hexagonal in plan and consists of three stages, decreasing towards the top, which is finished by a crocketed spirelet and crown. The lower stage is flanked by compartments enclosing the arms of England, Castile and Leon, and Pontorie. Its restoration has not been wholly satisfactory. The royal gunpowder factory is in the immediate vicinity; government works were built in 1850 at Quinton Hill, ½ m. W. of the town, for the manufacture of cordite; and the town possesses gun-cotton and percussion-cap factories, flour-mills, malt kilns and breweries. Watercresses are largely grown in the neighbourhood, and there are extensive market gardens and nurseries.

The town probably grew round the church, which was built early in the 11th century and extended to the confines of the true cross.

The manor was held by the abbot and convent of the Holy Cross from the reign of Henry I. to that of Henry VIII. The town was never more than a market town until 1894. In 1845 a local board of twelve members was formed to govern it; in 1894, under the Local Government Act, it was brought under an urban district council. The market of Waltham was granted to the abbey by Richard I. and confirmed in 1227 by Henry III., who also conceded two fairs in 1257: one for ten days following the Invention of the Holy Cross, the other on the vigil of the Exaltation of the Cross. These fairs lasted for seven days after the Charter from which the present market appears to be derived was granted by Queen Elizabeth in 1560, and gave a Tuesday market for miscellaneous stock. The fairs have died out, although as late as 1792 they were held on the 14th of May and the 25th and 26th of September. The fisheries in the river Lea appear in records from 1086 onwards. At the end of the 17th century a fulling mill is mentioned, and by the year 1721 three powder mills were in existence.

WALTHAMSTOW, a suburb of London in the Walthamstow parliamentary division of Essex, England, a short distance E. of the river Lea, with several stations on a branch of the Great Eastern railway, 6 m. N. of Liverpool Station, pop. of urban district (1891) 46,436; (1901) 95,131. It is sheltered on the north and east by low hills formerly included in Epping Forest. The church of St Mary existed at a very early period, but the present building, chiefly of brick, was erected in 1535 by Robert Thorne, a merchant, and Sir George Monoux, lord mayor of London, and has undergone frequent alteration. Besides other old brasses it contains in the north aisle the effigies in brass of Sir George Monoux (d. 1543) and Anne his wife. There is a number of educational institutions, including a school of art; Forest School, founded in 1834 in connexion with King's College, now ranks as one of the well-known English public schools. Brewing is extensively carried on.

In the reign of Edward the Conqueror Walthamstow belonged to Walthof, son of Siward, earl of Northumberland, who married Judith, niece of William the Conqueror, who betrayed him to his death in 1075. The estate subsequently passed in 1090 to Guy de Beauchamp, earl of Warwick, and on the attainder of Earl Thomas in 1396 reverted to the crown. Afterwards it came into the possession of Edmund, the 2nd earl of Somerset, from the Somersets it passed to Sir George Rodney, and in 1630 came to the Maynard family. It is supposed to have been the birthplace of George Gascoigne the poet (d. 1577). Sir William Batten, commissioner of the navy (d. 1667), the friend of Pepys, had his seat at Walthamstow, and was frequently visited here by Pepys.

WALTHARIUS, a Latin poet founded on German popular tradition, relates the exploits of the west Gothic hero Walter of Aquitaine. Our knowledge of the author, Ekkehard, a monk of St Gall, is due to a later Ekkehard, known as Ekkehard IV. (1160), who gave this story in the series of Lai искусных Galli (cap. 80). The poem was written by Ekkehard, generally distinguished as Ekkehard I., for his master Geraldus in his schooldays, probably therefore not later than 920, since he was probably no longer young when he became deacon (in charge of ten monks) in 957. He died in 973. Waltharius was dedicated by Geraldus to Erchanbald, bishop of Strassburg (fl. 965-981), but MSS. of it were in circulation before that time. Ekkehard IV. stated that he corrected the Latin of the poem, the Germanisms of which offended his patron Aribo, archbishop of Mainz. The work probably harked the cupidity of lost, so that if the author was still in his teens when he wrote, it it must have possessed considerable and precocious powers.

Walter was the son of Alphere, ruler of Aquitaine, which in the 5th century, when the legend developed, was a province of the west Gothic Spanish kingdom. When Attila invaded the west the western princes are represented as making no resistance. They purchased peace by offering tribute and hostages. King Gibich, here described as a Frankish king, gave Hagen as a hostage (of Trojan race, but not, as in the Nibelungenlied, a kinsman of the royal house) in place of his infant son Gunther; the Burgundian king Herithr, his daughter Hildegund; and Alphere, his son Walter. Hagen and Walter became brothers in arms, fighting at the head of Attila's armies, while Hildegund was put in charge of the queen's treasure. Presently Gunther succeeded his father and refused to pay tribute to the Huns, whereupon Hagen fled from Attila's court. Walter and Hildegund, who had been betrothed in childhood, also made good their escape during a drunken feast of the Huns, taking with them a great treasure.

The story of their flight forms one of the most charming pictures of old German story. They were recognized at Worms, however, where the tresspass was exacted. The custody of lost, so that if the author was still in his teens when he wrote, it must have possessed considerable and precocious powers.

The occasional incoherencies of the tale make it probable that many changes have been introduced in the legend. The Thidreks Saga (chaps. 241-244) makes the story more probable by representing the pursuers as Huns. There is reason to believe that Hagen was originally the father of Hildegund, and that the tale was a variant of the saga of Hild as told in the Skaldskaparmál. Hild, daughter of King Högni, was carried off by Hedin, son of Hjarrandi (A.S. Heorrenda). The fight between the forces of father and lover only ceased at sundown, to be renewed on the morrow, since each evening Hild raised the dead by her incantations. This is obviously a form of the old myth of the daily recurring struggle between light and darkness. The songs sung by Hildegund in Waltharius during her night watches were probably incantations, a view strengthened by the fact that in a Polish version the glance of Helgunda is said to have inspired the combatants with new strength. Hildegund has retained nothing of Hild's fierceness, but the fragment of the Anglo-Saxon Waldere shows more of the original spirit. In Waltharius Hildegund advises Walter to fly; in Waldere she urges him to the combat.

BIBLIOGRAPHY.—Waltharius was first edited by Fischer (Leipzig, 1790). Later and more critical editions are by Jacob Grimm (Lan, Geschichte des Mittelalters (Gottingen, 1838); R. Pelzer (Berlin, 1875); V. Scheffel and A. Holker (Stuttgart, 1874); there are German translations by F. Linzig (Paderborn, 1885), and H. Altboh (Leipzig, 1896). Walther's novel of Eckehard (Stuttgart, 1887). The A.S. fragments of Waldere were first edited by G. Stephens (1860), afterwards by R. Wulker in Bild. der angelsächs. Poesie (vol. i.
Cassel, 1881); by F. Holthausen in Göttingens Höherschul- Arbeitsbuch (vol. v., 1889), with autotype reproductions of the two leaves which have been preserved. See also A. Ebert, Allg. Gesch. der Lit. des Mittelalters im Abhandl. K. H. Festschrift der deutschen Literatur zum 800. Jubiläum der deutschen Literatur bis zum Ausgang des Mittelalters (vol. i., pt. ii., Strassburg, 1897); M. D. Larmé, The Saga of Walter of Aquitaine (Baltimore, 1892); B. Symons, Deutsche Heldensage (Strassburg, 1909). "D'Youville's French ballads of the " Brand" and " Erlinton " (F. J. Child's English and Scottish Popular Ballads, i. 88 seq.).

WALTHEOF, (d. 1076), earl of Northumbria, was a son of Earl Siward of Northumbria, and, although he was probably educated for the church, he seems to have been sent to France to study about 1065. After the battle of Hastings he submitted to William the Conqueror; but when the Danes invaded the north of England in 1069 he joined them and took part in the attack on York, only, however, to make a fresh submission after their departure in 1070. Then, restored to his earldom, he married William's niece, Judith, and in 1072 was appointed earl of Northumbria. In 1075 Waltheof joined the conspiracy against the king arranged by the earls of Norfolk and Hereford; but soon repenting of his action he confessed his guilt to Archbishop Lanfranc, and was pardoned in Normandy. Returning to England with William he was arrested, and after being brought twice before the king's court was sentenced to death. On the 31st of May 1076 he was beheaded at St. Giles's Hill, near Winchester. Weak and unreliable in character, Waltheof, like his father, is said to have been a man of immense bodily strength. Devout and charitable, he was regarded by the English as a martyr, and miracles were said to have been worked at his tomb at Crowland. The earl left three daughters, the eldest of whom, Matilda, brought the earldom of Huntingdon to her second husband, David I. of Scotland. One of Waltheof's grandparents was Waltheof (d. 1159), abbot of Melrose.

WALTHEOF, BERNHARD (1430-1504), German astronomer, was born at Nuremberg in 1430. He was a man of large means, which he devoted to scientific pursuits. When Regioniamentum (q.v.) settled at Nuremberg in 1471, Walther built for their common use an observatory at which in 1484 clocks driven by weights were first used in astronomical determinations. He further brought into prominence the effects of refraction in altering the apparent altitudes of the heavenly bodies, and calculated Venus for the moon as a connecting-link between observations of the sun and stars. Walther established a printing-press, from which some of the earliest editions of astronomical works were issued. His observations, begun in 1475 and continued until his death in May 1504, were published by J. Schöner in 1544, and by W. Snell in 1618, as an appendix to his Observationes Heliasticae.

WALTHEOF VON DER VOGELWEIDE (c. 1170-c. 1230), the most illuminated of medieval German lyric poets. For all his fame, Walther's name is not found in contemporary records, with the exception of a solitary mention in the travelling accounts of Bishop Wolfgier of Passau—" Walther cantori de Vogelweide pro pellicio V. solidos longus "—" To Walther the singer of the Vogelweide five shilling to buy a fur coat," and the main sources of information about him are his own poems and occasional references by contemporaneous Minnesingers. It is clear from the title hér (Herr, Sir) these give him, that he was of noble birth; but it is equally clear from his name Vogelweide (Bird Meadow, a gathering place or preserve of birds) that he belonged not to the higher nobility, but to the titles from castles or villages, but to the nobility of service (Dienst). He was a humble retainer of the great lords, who in wealth and position were little removed from non-noble free cultivators. For a long time the place of his birth was a matter of dispute, until Professor Franz Pfeiffer established beyond reasonable doubt that he was born in the Wipthal in Tirol, where, not far from the little town of Sterzing on the Eisak, a wood—called the Vorder- und Hintervogelweide—preserves at least the name of his vanished home. This origin would account for what is known of Walther's early life. Tirol was at this time the home of several noted Minnesingers; and the court of Vienna, under the enlightened duke Frederick I. of the house of Babenberg, had become a centre of poetry and art. It was that the young poet learned his craft under the renowned master Reinmar the Old, whose death he afterwards lamented in two of his most famous lyric poems; and in the open-handed duke he found his first patron. This happy period of his life, during which he produced the most charming and spontaneous of his love-lyrics, came to an end with the death of Duke Frederick in 1198. Hencenward Walther was a wanderer from court to court, singing for his lodging and his bread, and ever hoping that some patron would arise to save him from this "juggler's life " (gugelhupf) and the shame of ever playing the guest. For moral success in this profession he was not calculated. His optimism of men and manners was scathing; and even when this did not touch his princely patrons, their underlings often took measures to rid themselves of so uncomfortable a tenor. Thus he was forced to leave the court of the generous duke Bernhard of Carinthia (1120-1136); after an experience of the tumultuous household of the landgrave of Thuringia he warns those who have weak ears to give it a wide berth; and after three years at the court of Dietrich I. of Meissen (reigned 1195-1221) he complains that he found neither money nor praise. Walther was, in fact, a man of strong views; and it is this which gives him his main significance in history, as distinguished from his place in literature. From the moment when the death of the emperor Henry VI. (1197) opened the fateful struggle between empire and papacy, Walther threw himself ardently into the fray on the side of German independence and unity. Though his religious poems sufficiently prove the sincerity of his catholicism, he remained to the end of his days opposed to the extreme claims of the popes, whom he attacks with a bitterness which can only be justified by the strength of his patriotic feelings. His political poems begin with an appeal to Germany, written in 1198 at Vienna, against the despotic ambitions of the princes:

" Crown Philip with the Kaiser's crown
And bid them vex thy peace no more."

He was present, on the 5th of September, at Philip's coronation at Mainz, and supported him till his victory was assured. After Philip's murder in 1200, he "said and sang" in support of Otto of Brunswick against the papal candidate Frederick of Stauien; and only when Otto's usefulness to Germany had been shattered by the battle of Bouvines (1212) did he turn to the rising star of Frederick II., now the sole representative of German majesty against pope and princes. From the new emperor his genius and his zeal for the empire at last received recognition; and a small fief in Franconia was bestowed upon him, which, though he complained that its value was little, gave him the home and the fixed position he had so long desired. That Frederick gave him an even more signal mark of his favour by making him the tutor of his son Henry VII., is more than doubtful. The fact, in itself highly improbable, rests only upon the evidence of a single poem which is capable of another interpretation. Walther's restless spirit did not suffer him to remain long on his new property. In 1217 we find him once more at Vienna, and again in 1220 after the return of Duke Leopold VI. from the crusade. About 1224 he seems to have settled on his fief near Würzburg. He was active in urging the German princes to take part in the crusade of 1228, and may have accompanied the crusading army at least as far as his native Tirol. In a beautiful and pathetic poem he paints the grandiose and grandiose scenes of his childhood and his life made his life seem a thing dreamt. He died about 1250, and was buried at Würzburg, after leaving directions, according to the
story, that the birds were to be fed at his tomb daily. The original gravestone with its Latin inscription has disappeared; but in 1843 a new monument was erected over the spot. There is also a fine statue of the poet at Bozen, unveiled in 1877.

Historically interesting as Walton's political verses are, their merit has been not a little exaggerated by modern German critics, who saw their own imperial aspirations and anti-papal prejudices reflected in this patriotic poet of the middle ages. Of more lasting value are the beautiful lyrics, mainly dealing with love, which led his contemporaries to hail him as their master in song (unsers sangen meister). He is of course unequal. At his worst he exerts not riddles above the grossest conventionalities of his school. At his best he shows spontaneity, a charm and a facility which his rivals sought in vain to emulate. His earlier lyrics are full of the joy of life, of feeling for nature and of the glory of love. Greatly daring, he even rescues love from the convention which had made it the prerogative of the nobly born, contrasts the titles "woman" (wif) and "lady" (lodowe) to the disadvantage of the latter, and puts the most beautiful of his verses—Unter der Linden—into the mouth of a simple girl. A certain seriousness, which is apparent under the joyousness of his earlier work, grew on him with years. Religious and didactic poems became more frequent, and his verses in praise of love turn at times to a protest against the laxer standards of an age demoralized by political unrest. Throughout his attitude is healthy and sane. He preaches the crusade; but at the same time he suggests the virtue of toleration, pointing out that in the worship of God

"Christians, Jews and heathen all agree."

He fulminates against "false love"; but pours scorn on those who maintain that "love is sin." In an age of monastic ideals and loose morality there was nothing commonplace in the simple lines in which he sums up the inspiring principle of chivalry at its best:—

"Swer quotes wibes liebe hat
Der schamts sich ieder missät."

Altogether Walton's poems give us the picture not only of a great artistic genius, but of a strenuous, passionate, very human and very lovely character.

WALTON, Brian (1600–1661), English divine and scholar, was born at Seymour, in the district of Cleveland, Yorkshire, in 1600. He went to Cambridge as a sizar of Magdalene College in 1616, migrated to Peterhouse in 1618, was bachelor in 1619 and master of arts in 1623. After holding a school mastership and two curacies, he was made rector of St Martin's Ongar in London in 1628, where he took a leading part in the contest between the London clergy and the citizens about the city titles, and compiled a treatise on the subject, which is printed in Brewer's Collectanea (1751). His conduct in this matter displayed his ability, but his zeal for the exaction of ecclesiastical dues was remembered in 1641 in the articles brought against him in parliament, which appear to have led to the sequestration of his very considerable preferments. He was also charged with Popish practices, but on frivolous grounds, and with aspersing the members of parliament for the city.

1 He who has the love of a good woman
Is ashamed of every mistake.

2 He was from 1635 to 1636 rector of Sandon, in Essex, where his wife, Anne Claxton, is buried. He appears to have also been a prebendary of St Paul's, and for a very short time he had held the rectory of St Giles in the Fields.

In 1642 he was ordered into custody as a delinquent; thereafter he took refuge in Oxford, and ultimately returned to London to the house of William Fuller (1587–1659), dean of Ely, whose daughter Jane was his second wife. In this retirement he gave himself to Oriental studies and carried through his great work, a Polyglot Bible which should be completer, cheaper and provided with a better critical apparatus than any previous work of the kind (see POLYGLOT). The proposals for the Polyglot appeared in 1652, and the book itself came out in six great folios in 1657, having been printing for five years. Nine languages are used: Hebrew, Chaldean, Samaritan, Syriac, Arabic, Greek, Latin, Coptic, and Ethiopic. Among his collaborators were James Ussher, John Lightfoot and Edward Pearce, Edmund Castell, Abraham Wheelocke and Patrick Young, Thomas Hyde and Thomas Gravbes. The great undertaking was supported by liberal subscriptions, and Walton's political opinions did not deprive him of the help of the Commonwealth; the paper used was freed from duty, and the interest of Cromwell in the work was acknowledged in the original preface, part of which was afterwards cancelled to make way for more loyal expressions towards that restored monarchy under which Oriental studies in England immediately began to languish.

Walton himself, after his retirement, was appointed to the see of Chester. He was consecrated bishop in December 1660. In the following spring he was one of the commissioners at the Savoy Conference, but took little part in the business. In the autumn of 1661 he paid a short visit to his diocese, and returning to London he died on the 29th of November.

However much Walton was indebted to his helpers, the Polyglot Bible is a great monument of industry and of capacity for directing a vast undertaking, and the Prolegomena (separately reprinted by Darby, 1777, and by Francis Wrangham, 1825) show judgment as well as learning. The same qualities appear in Walton's Considerations on the River Stour (1669), where he thought that the accumulation of material for the revision of the received text tended to atheism. Among Walton's works must also be mentioned an Introductio ad lectionem singularum orientalium (1643; 2nd ed., 1655), meant to prepare the way for the Polyglot.

WALTON, Izak (1593–1683), English writer, author of The Compleat Angler, was born at Stafford on the 9th of August 1593, the son of John Walton, a regimental chaplain in Ireland and later vicar of St John's-in-the-Wood, Westminster. His wife was Jane Jervis, and nothing more is known of his parentage. He settled in London as an ironmonger, and at first had one of the small shops, 7½ ft. by 5 ft., in the upper storey of Gresham's Royal Borse or Exchange in Cornhill. In 1614 he had a shop in Fleet Street, two doors west of Chancery Lane. Here, in the parish of St Dunstan's, he gained the friendship of Dr John Donne, then vicar of that church. His first wife, married in December 1626, was Rachel Floud, a great-niece of Archbishop Cranmer. She died in 1640. He married again soon after, his second wife being Anne Ken—the pastoral "Kenna" of The Angler's Wish—step-sister of Thomas Ken, afterwards bishop of Bath and Wells. After the Royalist defeat at Marston Moor, he retired from business. He had bought some land near his birthplace, Stafford, and he went to live there; but, according to Wood, spent most of his time "in the families of the eminent clergyman of England, of whom he was much beloved"; and in 1650 he was again living in Clerkenwell. In 1653 came out the first edition of his famous book, The Compleat Angler. His second wife died in 1662, and was buried in Worcester cathedral church, where there is a monument to her memory. One of his daughters married Dr Hawkins, a prebendary of Winchester. The last forty years of his long life seem to have been spent in ideal leisure and occupation, the old man travelling here and there, visiting his "eminent clergymen" and other brethren of the angle, compiling the biographies of congenial spirits, and collecting here a little and there a little for the enlargement of his famous treatise. After 1662 he found a home at Farnham Castle with George Morley, bishop of Winchester, to whom he dedicated his Life of George Herbert and also that of Richard Hooker; and from time to time he visited Charles Cotton in
his fishing house on the Dove. He died in his daughter’s house at Winchester on the 15th of December 1683, and was buried in the cathedral. It is characteristic of his kindly nature that he left his property at Shalford for the benefit of the poor of his native town.

Walton hooked a much bigger fish than he angled for when he offered his unique treatise, The Compleat Angler, to the public. There is hardly a name in English literature, even of the first rank, whose immortality is more secure, or whose personality is the subject of a more devoted cult. Not only is he the sacred
take of a considerable sect in the religion of recreation, but multitudes who have never put a worm on a hook—even on a fly-hook—have been caught and securely held by his picture of the delights of the gentle craft and his easy leisurely transcript of his own simple, peaceful, lovable, and amusing character.

The Compleat Angler was published in 1653, but Walton continued to add to it, and the completion of it is still a matter of doubt even for professional anglers.

The first edition the thirteen chapters of the original have grown to twenty-one, and a second part was added by his loving friend and brother angler Charles Cotton, who took up "Venator" where Walton had left him and completed his instruction in fly-fishing and the making of flies. Walton could not profess to be an expert with the fly; the fly-fishing in his first edition was addition by Walton and by a batman, who produced a treatise of his own in 1659; but in the use of the live worm, the grasshopper and the frog "Fis-
cator," himself could speak as a master.

The famous passage about the frog—often misquoted about the worm—"use him as though you loved him, that is, harm him as little as you possibly, that he may live the longer"—appears in the original edition. The additions made as the work grew were merely to the technical part; happy quotations, new turns of phrase, songs, poems and anecdotes were introduced as if the leisurely author, who wrote it as a recreation, had kept it constantly in his mind and talked it over point by point with his numerous brethren. There were originally only two interlocutors in the opening scene, "Piscator" and "Viator;" but in the second edition, as if in answer to an objection that "Piscator" had it too much in his own way in praise of angling, he introduced the falconer, "Auceps," changed "Viator" into "Venator" and made the new companions each dilate on the joys of his favourite sport.

Although The Compleat Angler was not Walton’s first literary work, his leisurely labours as a biographer and a historian grew out of that absorbing interest. It was probably as an angler that he made the acquaintance of Sir Henry Wotton, but it is clear that Walton had more than a love of fishing and a humorous temper to recommend him to the friendship of the accomplished ambassador. At any rate, Wotton, who had intended to write the life of John Donne, and had already corresponded with Walton on the subject, left the task to him. Wotton had already contributed an Elegy to the 1653 edition of Donne’s poems, and he completed and published the life, much to the satisfaction of the most learned critics, in 1640. Sir Henry Wotton dying in 1650, Walton undertook the completion of his work, and it was published in 1651 and 1652. His life of Hooker was published in 1662, that of George Herbert in 1670 and that of Bishop Sanderson in 1678. All these subjects were endeared to the biographer by a certain gentleness of disposition and cheerful piety; three of them at least—Donne, Wotton and Herbert—were angels. Their lives were evidently written with loving pains, in the same leisurely fashion as his Angler, and like it are of value less as exact knowledge than as harmonious and complete pictures of character.

Walton also rendered affectionate service to the memory of his friends Sir John Sionegoff and John Chalkhill, editing with prefatory notices Sionegoff’s Hero of Lorenzo in 1652 and Chalkhill’s Thecla and Clearchus a few months before his own death in 1683. His poems and prose fragments were collected in 1873 under the title of Waltoniana.

The best-known old edition of the Angler is J. Major’s (2nd ed., 1718). The book was edited by Andrew Lang (1882), and various modern editions have appeared. The standard biography is that of Sir Harris Nicol, prefixed to an edition of the Angler (1836). There are notices also, with additional scraps of fact, annexed to two American editions, Bethune’s (1847) and Dowling’s (1853). An edition of Walton’s Lives, by C. Sampson, appeared in 1893. See also Isaak Walton and his Friends, by S. Martin (1903).

WALTON-LE-DALE, an urban district in the Darwen parliamentary division of Lancashire, England, on the S. bank of the Ribble, immediately above Preston. Pop. (1901) 11,271. The church of St Leonard, situated on an eminence to the east of the town, was originally erected in the 11th century. The earliest portions of the present building are the Perpendicular chancel and tower, the nave having been rebuilt in 1758, while the transepts were erected in 1816. There are a number of interesting old brasses and monuments. Cotton-spinning is carried on, and there are market-gardens in the vicinity. Roman remains have been found here, and there was perhaps a roadside post on the site. The manor of Walton was granted by Henry de Lacy about 1130 to Robert Banastre. It afterwards passed by marriage to the Langtons, and about 1592 to the Hoghtons of Hoghton. Walton was the principal scene of the great battle of Preston, fought on the 17th of August 1648 between Cromwell and the duke of Hamilton. In 1701 the duke of Norfolk, the Earl of Derwentwater and other Jacobites incorporated the town by the style of the mayor and corporation of the ancient borough of Walton, and in 1719 the passage of the Ribble was bravely defended against the Jacobites by Parson Woods and his parishioners of Atherton (q.v.).

WALTON-ON-THAMES, an urban district in the Epsom parliamentary division of Surrey, England, pleasantly situated on the right bank of the Thames, 17 m. W.S.W. from London by the London & South-Western railway. Pop. (1901) 10,329. The church of St Mary has late Norman portions, and contains numerous memorials, including examples of the work of Chantrey and Roubilac. A verse inscribed upon a pillar is reputed to be Queen Elizabeth’s profession of faith as regards transplantation. The queen was a frequent resident at Henry VIII’s palace of Oatlands Park, which was destroyed during the civil wars of the 17th century. The property subsequently passed through various hands, and the park is reduced in extent by the modern growth of villages surrounding it. It contains, however, a remarkable grotto built of mineral and stalactitic rock, shells and other similar materials, by one of the early of Lincoln when owner. Ashley Park, a Tudor mansion (in the main modernized), attributed to Cardinal Wolsey, was at times the residence of Cromwell, while William Cavendish, Duke of Devonshire, was the tenant of the estate rebuilt by Sir Robert Wotton’s (q.v.) the most recent period of the town’s history. It was occupied by the old manor house of Walton. Walton is a favourite resort of anglers and boating parties.

WALTON-ON-THE-NAZE (or Walton-le-Soken), a watering-place in the Harwich parliamentary division of Essex, England, the terminus of a branch of the Great Eastern railway from Colchester, 713 m. E.N.E. from London. Pop. of urban district (1901) 2,014. This portion of the coast has suffered from encroachment of the sea, and a part of the old village of Walton, with the church, was engulfed towards the end of the 18th century and reconstructed on a new site. The town was completed about the site of the old church, was occupied in the 19th century of the site of the old church, and the site of the old church, was occupied in the 19th century. It was endowed with the lands thus consumed "praebenda consumpta per mora." On the E. side of the town is the open North Sea, with a fine stretch of sand and shingle, affording good bathing. To the west is a salt marsh extending to low islands, known as Harford Water. The Naze is a promontory in miles. N. by E. of the town, and in the vicinity of Walton are low cliffs exhibiting the fossiliferous red crag formation. The church of All Saints is a brick building dating mainly from 1804. Walton has a public hall, several hotels and a small community of passenger steamers in connexion with Harwich, Clacton-on-Sea, and London are maintained in the summer.

WALTZING MOUSE (or JAPANESE WALTZING MOUSE), a pied race of the house mouse (Mus musculus), or one of its allies,
WALWORTH—WANAMAKER

originally bred in China, and known in Japan as the Nankin mouse. The habit of these mice of spinning round and round after their tails is highly developed, and continually exercised. In Japan, where there were originally two breeds, a grey and a white, these mice are kept in cages on account of their dancing propensity. The dancing was at first supposed to be due to a disease of the labyrinth of the ear; but Dr K. Kishi, in a paper in the Zeitschrift für wissenschaftliche Zoologie (vol. xxi. pt. 3), concludes that it is the effect of confinement for untold centuries in small cages.

WALWORTH, SIR WILLIAM (d. 1385), lord mayor of London, belonged to a good Durham family. He was apprenticed to John Lovekyn, a member of the Fishmongers' Gild, and succeeded his master as alderman of Bridge ward in 1368, becoming sheriff in 1370 and lord mayor in 1374. He is said to have suppressed usury in the city during his term of office as mayor. His name frequently figures as advancing loans to the king, and he supported John of Gaunt, duke of Lancaster, in the city, where there was a strong opposition to the king's uncle. His most famous exploit was his encounter with Wal Tyler in 1381, during his second term of office as lord mayor. In June of that year, when Tyler and his followers entered south London, Walworth defended London Bridge against them; he was with Richard II. when he met the insurgents at Smithfield, and assisted in slaying their leader (see TYLER, Wal), afterwards rising the Church bodyguard as a time imposed to be due for suppressing and an hour at the king's service; for which service he was rewarded by knighthood and a pension. He subsequently served on two commissions to restore the peace in the county of Kent. He died in 1385, and was buried in the church of St Michael, Crooked Lane, of which he was a considerable benefactor. Sir William Walworth was the most distinguished member of the Fishmongers' Gild, and he invariably figured in the pages prepared by them when one of their members attained the mayoralty. He became a favourite hero in popular tales, and appeared in Richard Johnson's Nine Worthies of 1546.

See William Herbert, The History... of St Michael, Crooked Lane, London... (1831); W. and R. Woodcock, Lives of Illustrious Lord Mayors (1846); an account of Wal Tyler's rebellion in a fragmentary chronicle printed by G. H. Trevelyan in the English Historical Review (July 1898).

WAMPUM, or WAMPUM-PEAGE (Amer. Ind. wampum, "white"; peag, "bead"), the shell-money of the North American Indians. It consisted of beads made from shells, and, unlike the cowry-money of India and Africa (which was the shell in its natural state), required a considerable measure of skill to make. A wampum bead was of two colours, dark purple and white, of cylindrical form, averaging a quarter of an inch in length, and about half that in diameter. Its colour determined its value. The term wampum or wampum-peage was apparently applied to the beads only when strung or woven together. They were ground as smooth as glass and were strung together by a hole drilled through the centre. Dark wampum, which was made from a "hard shell" clam (Venus mercenaria), popularly called quahog or quahog, a corruption of the Indian name, was the most valuable. White wampum was made from the shell of whelks, either from the common whelk (Bussumandans) or from the purple whelk (Pyraul garda) and Pyraula carica. Wampum was employed most in New England, but it was common elsewhere. By the Dutch settlers of New York it was called seawen or seawen, and roeoke in Virginia, and perhaps farther south, for shell-money was also known in the Carolinas, but whether the roeoke of the Virginian Indians was made from the same species of shell as wampum is not clear. Cylindrical shell-beads similar to the wampum of the Atlantic coast Indians were made to some extent by the Indians of the west coast. This was manufactured from the Mytilus californianus, mussel which abounds there.

In the trading between whites and Indians, wampum so completely took the place of ordinary coin that its value was fixed by legal enactment, three to a penny and five shillings a fathom. The fathom was the name for a count, and the number of shells varied according to the accepted standard of exchange. Thus where six wampum went to the penny, the fathom consisted of 360 beads; but where four made a penny, as under the Massachusetts standard of 1640, then the fathom counted 240. The beads were at first worth more than five shillings per fathom, the price at which they passed current in 1643. A few years before the fathom had been worth nine or ten shillings. Connecticut received wampum for taxes in 1637 at four a penny. In 1640 Massachusetts adopted the Connecticut standard, "white to pass at four and bleuse at two a penny." There was no restriction on the manufacture of wampum, and it was made by the whites as well as the Indians. The market was soon flooded with carelessly made and inferior wampum, but it continued to be circulated in the remote districts of New England through the 17th century, and even into the beginning of the 18th. It was current with silver in Connecticut in 1704.

Wampum was also used for personal adornment, and belts were made by embroidering wampum upon strips of deerskin. These belts or scarves were symbols of authority and power and were surrendered on defeat in battle. Wampum also served a mnemonic use as a tribal history or record. "The belts that pass from one nation to another in all treaties, declarations and important transactions are very carefully preserved in the chiefs' cabins, and serve not only as a kind of record or history but as a public treasury. According to the Indian conception, these belts could tell by means of an interpreter the exact rule, property, and precepts by which the nation lived. If a belt was a present, or a reward, the three were the exclusive record. A strand of wampum, consisting of purple and white shell-beads or a belt woven with figures formed by beads of different colours, operated on the principle of associating a particular fact with a particular string or figure, thus giving a serial arrangement to the facts as well as fidelity to the memory. These strands and belts were the only visible records of the Iroquois, and they were the trained interpreters who could draw from their strings and figures the acts and intentions locked up in their remembrance" (Major Rogers, Account of the Iroquois, London, 1763).

WANA, a valley and frontier outpost of Waziristan in the North-West Frontier Province of India. It lies to the west of the Mahsud country and north of the Gomal and Chitral rivers, and is inhabited by the Waziri tribe. Lying on the border of Afghanistan it is conveniently placed for dominating Waziristan on the north and the Gomal Pass on the south, and occupies very much the same strategic position as the Zhob valley holds in Baluchistan. It forms the end of the chain of outposts extending from Quetta to Waziristan, and can be supported either from India by the Gomal Pass or from Quetta by the Zhob valley. In 1854, when the Indio-Afghan boundary commission was delimiting the Waziri border, the Mahsud Waziris, thinking their independence to be threatened, made a night attack on the camp of the commission at the Zhob Kundi, the Waziri frontier post of the same year, and the occupation of Wana by British troops. On the formation of the North-West Frontier Province in 1901 it was decided to replace the troops by militia, and Wana was handed over to them in 1904. It is now the headquarters of the political agency of Southern Waziristan.

WANAMAKER, JOHN (1838– ), American merchant, was born, of Palatine-Huguenot stock, in Philadelphia, Pennsylvanla, on the 17th of July 1838. He attended a public school in that city until he was fourteen, then became an errand boy for a book store, and was a retail clothing salesman from 1856 until 1861, when he established with Nathan Brown (who afterward became his brother-in-law) the clothing house of Wanamaker & Brown, in Philadelphia, the partnership continuing until the death of Brown in 1868. In 1869 Wanamaker founded the house of John Wanamaker & Company; and in 1875 bought the
Pennsylvania Railroad Company's freight depot at Thirteenth and Market streets, and in the following year opened it as a dry goods and clothing store, subsequently much enlarged. In September 1866 he acquired from Hilton, Hughes & Company the former New York store of A. T. Stewart, and thereafter greatly enlarged it (Durham, 1876); this, and the Philadelphia store, are among the largest department stores in the United States. Mr Wanamaker was postmaster-general in President Benjamin Harrison's cabinet in 1889-1893, and brought about the establishment of post-offices on ocean-going vessels. He early identified himself with religious work in Philadelphia; was the first paid secretary, in 1857-1861, of that city's Young Men's Christian Association, of which he was president in 1879-1883, and in 1883 founded, and thereafter served as superintendent of, the Bethany (Presbyterian) Sunday School, one of the largest in the world. He took an active part in the movement which resulted in the formation of the United States Christian Commission in 1861.

WANDERU (WANDEROO), the native name for the species of langur monkeys (Semnopithecus) inhabiting the island of Ceylon; but in India commonly misapplied to the lion-tailed macaque, Macacus silenus (see Primates).

WANDESDFOR, CHRISTOPHER (1592-1640), lord deputy of Ireland, was the son of Sir George Wandesford (1573-1612) of Kirklington, Yorkshire, and was born on the 24th of September 1592. Educated at Clare College, Cambridge, he entered the army in 1610. His commission as captain was due primarily to his friendship with Sir Thomas Wentworth, afterwards earl of Strafford. Although at first hostile to Charles I., this being evidenced by the active part he took in the impeachment of Buckingham, Wandesford soon became a royalist partisan, and in 1633 he accompanied Wentworth to Ireland, where he was already master of the rolls. His services to his chief were fully recognized by the latter, whom in 1640 he succeeded as lord deputy, but he had only just begun to struggle with the difficulties of his new position when he died on the 3rd of December 1642.

His son Christopher (1628-1687), created a baronet in 1662, was the father of Sir Christopher Wandesford (d. 1707), who was created an Irish peer as Viscount Castlecomer in 1707, Castlecomer in Kilkenny having been acquired by his grandfather when in Ireland. Christopher, the 2nd viscount (d. 1719), was secretary-at-war in 1717-1718. In 1738 John, 5th viscount, was created Earl Wandesford, but his titles became extinct when he died in January 1784.

WANDIWASH, a town in the North Arcto district of Madras, India. Pop. (1901) 5971. It is notable as the scene of the victory of Sir Eyre Coote in 1760, the most important ever won by the British over the French in India.

WANDSEK, a town of Germany, in the Prussian province of Schleswig-Holstein, practically forming a populous suburb of Hamburg, with which it is connected by a railway and an electric tramway. Pop. (1905) 31,263.

Wandsworth, the largest part of which is best known as the parish of Battersea, is one of the older parts of London, and was inhabited by the people of the Thames valley, and identified with the poet Johann Heinrich Voss and of Matthias Claudius, who here issued (1771-1772) the Wandsea lover Boten. There is a monument to Claudius in the town. Its leading manufactures are spirits, tobacco, beer, leather and confectionery; other industries are machine building and gardening.

WANDSWORTH, a south-western metropolitan borough of London, England, bounded N. by the river Thames and Battersea, and E. by Lambeth, and extending S. and W. to the boundary of the county of London. Pop. (1901) 232,034. The name, which occurs in Domesday, indicates the position of the village on the river Wand, a small tributary of the Thames. Wandsworth is the largest in area of the metropolitan boroughs, including the districts of Putney by the river, part of Clapham in the north-east, Streatham in the south-east, Balham and Upper and Lower Tooting in the centre and south. These are mainly residential districts, and the borough is not thickly populated. Towards the west, along the Upper Richmond and Kingston roads, there is considerable open country, undulating and well wooded. It is to a great extent preserved in the public grounds of Putney Heath, which adjoins Wimbledon Common, outside the borough, on the north; and Richmond Park and Barnes Common, parts of which are in the borough. Other public grounds are parts of Wandsworth Common (193 acres) and Clapham Common, both extending into Battersea, Tooting Bec (147 acres) and Streatham Common (66 acres), and Wandsworth Park bordering the Thames. The borough is connected with Fulham across the Thames by Wandsworth and Putney bridges. The annual Oxford and Cambridge boat-race starts from above Putney Bridge, finishing at Mortlake; and the club-houses of the principal clubs on the Thames are all situated on the Putney shore. Putney Heath was formerly notorious as a resort of highwaymen and duellists. Among the institutions of Wandsworth are the Royal Hospital for Incurables, Putney; the Fountain and the Grove fever hospitals, Lower Tooting; the Clapham School of Art, Wandsworth Technical Institute; the Roman Catholic Training College for Women, West Hill; and Wandsworth Prison, Heathfield Road. The parliamentary borough of Wandsworth returns one member, but the municipal borough also includes part of the Clapham division of the parliamentary borough of Battersea and Clapham.

WANGANAI, the principal port on the west coast of North Island, New Zealand, in the Waiteara county, at the mouth of the Wanganai river, 133 m. by rail N. of Wellington. Pop. (1906) 8175. The town is laid out in rectangular blocks at the foot of low hills, from the summit of which (as in Queen's Gardens) a splendid panorama is seen, including the snow-clad Mount Ruapehu to the north-east. The river bar obstructs navigation, the depth not exceeding 18 ft., so that large vessels must lie outside. The district is agricultural and pastoral, and wool and grain are exported, as well as meat and dairy produce, for which there are large refrigerating works. The Wanganai Collegiate School (Church of England) is one of the largest boarding schools in Australasia. The district was the scene of conflicts with the natives in 1847, 1863 and 1868, and in the beautiful Mountoa gardens a monument commemorates the battle of that name (May 14th, 1864). The settlement was founded in 1842.

WANGARA, the Hausa name for the Mandingo (q.v.), a people of West Africa, used also as the name of districts in the western and central Sudan. The Wangara are also known as Wangara, Wongara, Ungara, Wankore and Wako. According to Idrisi (writing in the 12th century), the Wangara country was renowned for the quantity and the quality of the gold which it produces. The country formed an island about 300 m. long by 150 in breadth, which the Nile (i.e. Niger) surrounded on all sides and at all seasons. This description corresponds fairly accurately with the tract of country between the Niger and its tributary the Bani. Idrisi's account of the annual emigration to the desert, the rise of the Niger, and its fall, is in some details correct, but in others the facts. He states that on the fall of the waters natives from all parts of the Sudan assembled to gather the gold which the subsidizing waters left behind. In the closing years of the 18th and the opening years of the 19th century the discoveries of Horinemann, Mungo Park and others revived the stories of Wangara and its richness in gold. Geographers of that period (e.g. Major Rennell) shifted the Wangara country far to the east and confused Idrisi's description with accounts which probably referred to Lake Chad. Gradually, however, as knowledge increased, the Wangara territory was again moved westward and was located within the Niger bend. The name has now practically disappeared from the maps save that a town in the hinterland of Dahomey is named Wangara (French spelling Ouangara). Idrisi's account as to the richness in gold of the upper Niger regions has basis in fact; though the gold brought
in considerable quantities to the European trading stations on the Gambia and Senegal in the 16th, 17th and 18th centuries appears to have come largely from Bambuk.

WANGARATTA, a town of Victoria, Australia, in the counties of Moira, Delatite and Bogong, at the junction of the Ovens and King rivers, in the north by rail N.E. of Melbourne. Pop. (1901) 2621. It is a prosperous little town in an agricultural district and is the see of an Anglican bishop. It has numerous industries, including flour-milling, tanning, flemmorying, brewing, coach-building, bacon-curing, and bicycle and butter making. Important stock sales are held fortnightly, and there is an annual agricultural exhibition.

WANSTEAD, an urban district in the Romford parliamentary division of Essex, England, forming a residential suburb of London, on a branch of the Great Eastern railway, 8 m. E. of London by train via the Eastern Counties Railway. Pop. (1881) 9179. Wanstead Park, 184 acres in extent, was opened in 1882. Northward extend the broken fragments of Epping Forest. Wanstead Flats, adjoining the Park, form another open ground. At Lake House Thomas Hood wrote the novel 'Tynney Hall.' At Wanstead Park the parish church is the Infant Orphan Asylum, founded in 1827, and the Royal Merchant Seamen's Orphan Asylum, established in London in 1817 and refounded here in 1861. In Wanstead Park is Eagle Pond or lake, 10 acres in extent. It is mentioned in Domesday, and the name is considered by some to be derived from Woden's stead or place, indicating a spot dedicated to the worship of Woden. It belonged before the time of Edward the Confessor to the monks of St Peter's, Westminster, and afterwards to the bishop of London, of whom it was held at the time of the Domesday Survey by Ralph, Fitz Brien. In the reign of Henry VIII. it came into the possession of the crown, and in 1540 it was bestowed by Edward VI. on Lord Rich; whose son sold it in 1577 to Robert Dudley, earl of Leicester. The original manor house was rebuilt by Lord Chancellor Rich, who was here visited by Queen Elizabeth in 1567, and for her entertainment Sir Philip Sidney wrote a dramatic interlude which was played before the queen at Wanstead garden, and is printed at the end of the 'Arcadia.' Sir Richard Child, afterwards earl of Tynley, built the splendid mansion of Wanstead House in 1715 (demolished in 1822), in which the prince of Condé and others of the Bourbon family resided during the reign of the first Napoleon.

WANTAGE, a market town in the Abingdon parliamentary division of Berkshire, England. Pop. of urban district (1901), 3786. The town, in a basin; White Horse Hill, a chalk hollow at the foot of the steep hills which border the Vale on the south, 2 m. S. of Wantage Road station on the Great Western railway, with which a steam tramway connects it. The church of St Peter and St Paul is cruciform, and as a whole Perpendicular in appearance, but retains a nave arcade and ornate tower-arches of the Early English period. The font is a fine specimen of the same style; and there is beautiful woodwork in the chancel. An altar-tomb in alabaster of 1361, and a fine brass of 1414, commemorate members of the family of Fitzwarren. There are other monuments and tombs in 1564 and 1587. The old building of the grammar school preserves a Norman door from another church, which formerly stood in the same churchyard with St Peter's. In the broad market-place is a great statue of King Alfred, executed by Count Gleichen and unveiled in 1877; for Wantage is famous as the birthplace of the king in 849. The town has a large agricultural trade and ironworks.

The title of Baron Wantage of Lockinge was taken in 1885 by Sir Robert Loyd-Lindsay (b. 1832) on his elevation to the peerage. He was the son of General James Lindsay of Balcarres, but took the additional surname of Loyd in 1858 on marrying the heiress of Lord Ovington. He is succeeded by his son; he fought with his regiment the Scots Fusilier Guards in the Crimea and won the V.C., retiring as lieutenant-colonel. He was M.P. for Berks from 1865 to 1885, and was financial secretary to the War Office in 1877-1880. The title became extinct at his death in 1900.

WAPENSHAW (M.E. for "weapon-show"), a periodical muster or review of troops formerly held in every district in Scotland, the object having been to satisfy the military chiefs that the arms of their retainers were in good condition. Scott's 'Old Mortality' gives a description of one. The name is still given to the large meetings held annually at Aberdeen and other places in Scotland.

WAPENTAKE, formerly the principal administrative division of the counties of York, Lincoln, Leicester, Nottingham, Derby and Rutland, corresponding to the hundred in the southern counties of England. In many cases, however, ancient wapentakes are now called hundreds. North of the Tees, Sadbergh in Durham is the only district which was called a wapentake, and the rest of the ancient administrative divisions of the three northern counties were called wapentakes. The word wapentake seems to have been first applied to the periodical meetings of the magnates of a district; and, if we may believe the 12th century compilation known as the 'Leges Edwardi,' it took its name from the custom in accordance with which they touched the spear of their newly-appointed magistrate with their own spears and so confirmed his appointment. Probably it was also usual for them to signify their approval of a proposal by the clash of their arms, as was the practice among the Scandinavian peoples. Wapentakes are not found outside the parts of England which were settled by the Danes. They varied in size in different districts; those of Yorkshire, for instance, being very much larger than those in Lincolnshire. Wapentake had its own court, which had the same jurisdiction as the hundred courts of the southern counties. In some cases, however, a group of wapentakes had a single court. It should be noticed that the court was styled 'wapentagiwm' simply, and not curia wapentagiwm.

See Sir Henry Ellis, General Introduction to Domesday Book; W. W. Skeat, Etymological English Dictionary; W. Stubbs, Constitutional History; and H. M. Chadwick, Studies on Anglo-Saxon Institutions (1905).

WAPPERS, EGIDE CHARLES GUSTAVE, BARON (1803-1874). Belgian painter, was born at Antwerp on the 23rd of August 1803. After studying at the Antwerp Academy he went to Paris in 1826. The Romantic movement was then astir in France, and in that vehement struggle towards a new ideal artists and political men were thrown together. Wappers was the first Belgian artist to take advantage of this state of affairs, and his first exhibited picture, "The Devotion of the Burgomaster of Leiden," appearing at the appropriate moment, had a marvellous success in the Brussels Salon of 1830. The picture, although political, was in fact a remarkable work, which revolutionized the taste of Flemish painters. Wappers was invited to the court of Brussels, and was favoured with commissions. In 1832 the city of Antwerp appointed him professor of painting, and his triumph was complete when he exhibited at the Antwerp Salon of 1834 his masterpiece "An Episode of the Belgian Revolution of 1830" (Brussels Gallery). He was subsequently appointed painter to the king of the Belgians, and at the death of Mathieu van Brée he was made director of the Antwerp Academy. Of his very numerous works we may name "Christ Entombed," "Charles I. taking leave of his Children," "Charles IX.," "Camoëns," "Peter the Great at Saardam," and "Boccaccio at the Court of Joanna of Naples." Louis Philippe gave him a commission to paint a large picture for the gallery at Versailles, "The Defence of Rhodes by the Knights of St John of Jerusalem," a work finished in 1844, when he received from the king the Belgians the title of baron. After retiring from the post of director of the Antwerp Academy, he settled in 1853 in Paris, where he died on the 6th of December 1874.

WAQIDIB (Abū 'Abdallah Mahommed ibn 'Umar al-Waqildi (742-823), Arabian historian, was born at Medina, where he became a corn-dealer but was compelled to flee from his creditors (owing largely to his generosity) to Bagdad. Here the Barmecide vizier Yahyā b. Khālid (see BARMECIDES) gave him means and
made him cadí in the western district of the city. In 819 he was transferred to Rosafa (Rusafa) on the east side. His greatest work is the Kitab ul-Maghasí, or history of Mahomet's campaigns.

The first third of the Kitab ul-Maghasí (one leaf missing) was published by A. von Kremer from a Damascus MS. (Calcutta, 1856). Supplementing this work the British Museum MS., containing the first half, all but one leaf. J. Wellhausen published an abridged German translation from another British Museum MS., under the title Muhammad in Medina (Berlin, 1882), probably the only safe guide in the time of the Crusades to incite the Moslems against the Christians, several works on the conquests of Islam. One of the best known is the Futih ud-Durr, printed in Venice, 1854-55, and also in English translation (Leiden, 1900), holds that this work is founded on that of Abu Hudhafa ul-Bukhari, which in turn is an edition of the real Futuh.

Significant is the edition of the "Warr." in the J. W. ROYAL LIBRARY, 1789.

WAR (O. Eng. warre, Fr. guerre, of Teutonic origin; cf. O.H.G. warran, to confound), the armed conflict of states, in which each seeks to impose its will upon the other by force. War is the opposite of Peace (q.v.), and is the subject of the military art. In separate sections below the general principles of the art of war are discussed, and the laws which have gradually become accepted among civilized peoples for the regulation of its condition. The details concerning the history of individual wars, and the various weapons and instruments of war, are given in separate articles.

The Navy, Conscription, Strategy, Tactics, Infantry, Cavalry, Artillery, Engineers, Fortification, Coast Defence, Officers, Staff, Orders, Supply and Transport, Uniforms, Arms and Armours, Guns, Rifles, Pistols, Sword, Lance, Ordnance, Machine Guns, Submarine Mines, Torpedo, &c. The important wars are dealt with under the names commonly given to them: e.g., American Civil War, American War of Independence, American War of 1812, Crimean War, Dutch Wars, Franco-German War, French Revolutionary Wars, Great Rebellion, Greek War of Independence, Italian Wars, Napoleonic Campaigns, Peloponnesian War, Peninsular War, Russian Wars, Russo-Japanese War, Russo-Turkish Wars, Servo-Bulgarian War, Seven Weeks' War, Seven Years' War, Spanish-American War, Spanish Succession War, Thirty Years' War. Important campaigns and battles are also separately treated (e.g., Waterloo, Trafalgar, Shenandoah Valley, Wilderness, Metz, &c.).

I. General Principles

It is not easy to determine whether industrial progress, improved organization, the spread of education or mechanical inventions have wrought the greater change in the military art. Modern conditions. War is first and foremost a matter of movement; and as such it has been considerably affected by the multiplication of good roads, the introduction of steam transport, and by the ease with which draught animals can be collected. In the second place, war is a matter of supply; and the large area of cultivation, the increase of live-stock, the vast trade in provisions, pouring the food-stuffs of one continent into another, have done much to lighten the inevitable difficulties of a campaign. In the third place, war is a matter of destruction; and while the weapons of armies have become more perfect and more durable, the modern substitutes for gunpowder have added largely to their destructive capacity. Fourthly, war is not merely a blind struggle between mobs of individuals, without guidance or coherence, but a conflict of well-organized masses, moving with a view to intelligent co-operation, acting under the impulse of a single will and directed against a definite objective. These masses, however, are seldom so closely concentrated that the impulse which sets them in motion can be promptly and easily communicated to each, nor can the right objective be selected without some knowledge of the enemy's strength and dispositions. Means of intercommunication, therefore, as well as methods of observation, are of great importance; and with the telegraph, the telephone, visual signalling, balloons, airships and improved field-glasses, the armies of to-day, so far as regards the maintenance of connexion between different bodies of troops, and the diffusion, if not the acquiring, of information, are at a great advantage compared with those of the middle of the 19th century.

War, then, in some respects has been made much simpler. Armies are easier to move, to feed and to maintain. But in other respects this very simplicity has made the conduct of a campaign more difficult. Not only is the weapon wielded by the general less clumsy and more deadly than heretofore, less fragile and better balanced, but, it acts with greater rapidity and has a far wider scope. In a strong and skillful hand it may be irresistible; in the grasp of a novice it is worse than useless. In former times, when war was a much slower process, and armies were less highly trained, mistakes at the outset were not necessarily fatal. Under modern conditions, the inexperienced commander will not be granted time in which to correct his deficiencies and give himself and his troops the needful practice. The idea of forging generals and soldiers under the hammer of war disappeared with the advent of "the nation in arms." Military organization has become a science, studied both by statesmen and soldiers. The lessons of history have not been neglected. Previous to 1870, in one kingdom only was it recognized that intellect and education play a more prominent part in war than stamina and courage. Taught by the disasters of 1866, Prussia set herself to discover the surest means of escaping the value of an educated army. The shrewdness of her sons understood the task. The nature of war was analysed until the secrets of success and failure were laid bare; and on these investigations a system of organization and of training was built up which, not only from a military, but from a political, and even an economical point of view, is the most striking product of the 19th century. The keynote of this system is that the best brains in the state shall be at the service of the war lord. None, therefore, but thoroughly competent soldiers are entrusted with the responsibility of command; and the education of the officer is as thorough as the system of military education now practised by the lawyer, the diplomatist and the doctor. In all ages the power of intellect has asserted itself in war. It was not courage and strategy that made Hannibal, Alexander and Caesar the greatest names of antiquity. Napoleon, Wellington and the Archduke Charles were certainly the best-educated soldiers of their time; while Lee, Jackson and Sherman probably knew more of war, before they made it, than any one else in the United States. But it was not until 1866 and 1870 that the preponderating influence of the trained mind was made manifest. Other wars had shown the value of an educated general; these showed the value of an educated army. It is true that Moltke, in mental power and in knowledge, was in no wise inferior to the great captains who preceded him; but the remarkable point of his campaigns is that so many capable generals had never before been gathered together under one flag. No campaigns have been submitted to such searching criticism. Never have mistakes been more sedulously sought for or more frankly exposed. And yet, compared with the mistakes of other campaigns, even with that of 1815, where hardly a superior officer on either side had not seen more battles than Moltke and his comrades had seen field-days, they were astonishingly few. It is not to be denied that the losses of Prussia were hardly worthy of her steel. Yet it may be doubted whether either Austria or France ever put two finer armies into the field than the army of Bohemia in 1866 and the army of the Rhine in 1870. Even their generals of divisions and brigades had more actual experience than those who led the German army corps. Compared with the German rank and file, a great part of their non-commissioned officers and men were veterans, and veterans who had seen much service. Their chief officers were practically familiar with the methods of moving, supplying and manoeuvring large masses of troops; their marshals were gallant and successful soldiers. And yet the history of modern warfare records no defeats so swift and so complete as those of Königgrätz and Sedan. The great host of Austria was shattered to fragments in seven weeks; the French Imperial army was destroyed in seven weeks and three days; and to all intent and purpose the resistance they had offered was not much more effective than that of a respectable militia. But both the Austrian and the French armies were organized and trained under the old system. Courage, experience and professional pride they possessed in abundance. Man for man, in all virile qualities, neither officers nor men were inferior to
their foes. But one thing their generals lacked, and that was education for war. Strategy was almost a sealed book to them; organization a matter of secondary importance. It was no part of their duty, they declared, to train the judgment of their subordinates; they were soldiers, and not pedagogues. Knowledge of foreign armies and their methods they considered useless; and of war prepared and conducted on "business principles" they had never even dreamed of every word of their profession.

The popular idea that war is a mere matter of brute force, redeemed only by valour and discipline, is responsible for a greater evil than the complacency of the amateur. It blinds both the people and its representatives to their bounden duties. War is something more than a mere outgrowth of politics. It is a political act, initiated and controlled by the government, and it is an act of which the issues are far more momentous than any other. No branch of political science requires more careful study. It is not pretended that if military history were thoroughly studied all statesmen would become Moltkes, or that every citizen would be competent to set squadrons in the field. War is above all a practical art, and the application of theory to practice is not to be taught at a university or to be learned by those who have never rubbed shoulders with the men in the ranks. But if war were more generally and more thoroughly studied, the importance of organization, of training, of education and of readiness would be more generally appreciated; abuses would no longer be regarded with lazy tolerance; efficiency would be something more than a political catchword; and soldiers would be given ample opportunities of becoming assistants of every word of their profession.

Nor is this all. A nation that understood something about war would hardly suffer the fantastic tricks which have been played so often by the best-meaning statesmen. And statesmen themselves would realize that when war is about their interference is worse than useless; that preparation for defence, whether by the multiplication of roads, the construction of railways, of arsenals, dockyards, fortresses, is not the smallest of their duties; and lastly, that so far as possible diplomacy and strategy should keep step. Each one of these is of far greater importance than the past. In the wars of the 18th century, English cabinets and Dutch deputies could direct strategic operations without bringing ruin on their respective countries. The armies of Austria in 1792-1795, controlled as they were by the Aulic Councils, were more formidable in the field than those of the French Republic. In the campaigns of 1854 and 1859 the plans of Newcastle and Napoleon III. worked out to a successful issue; and if Lincoln and Stanton, his Secretary of War, impelled the Union in 1862, they saw the downfall of the Southern Confederacy in 1865. But in every case amateur was pitted against amateur. The Dutch had the support of planning or approving a sound plan of campaign than Louis XIV. The Aulic Council was not more of a marplot than the Committee of Public Safety. Newcastle was not a worse strategist than the tsar Nicholas I. Napoleon III. and his advisers were quite a match for the courtier generals at Vienna; while Lincoln and Stanton were not much more ignorant than Jefferson Davis. The amateur, however, can no longer expect the good fortune to be pitted against foes of a capacity no higher than his own. The professional analytical armies will be directed by soldiers of experience whose training for war has been incessant, and who will have at their command troops in the highest state of efficiency and preparation. It is not difficult to imagine, under such conditions, with what condescension punishment mistakes will be visited. Napoleon III. in 1859 committed as many blunders as he did in 1870. But the Austrians had no Moltke to direct them; their army corps were commanded by men who knew less of generalship than a Prussian major, and their armament was inferior. Had they been the Austrians of to-day, it is probable that the French and the allies would have been utterly defeated. And to come to more recent campaigns, while the Spaniards at Santiago had been Germans or French, the invasion would have ended in disastrous failure, it is impossible to doubt that had the Boers of 1899 possessed a staff of trained strategists, they would have shaken the British Empire to its foundations. The true test of direction of war is the number of mistakes. If they were numerous, although the enemy may not have been skilful enough to take advantage of them, the outlook for the future under the same direction, but against a more practised enemy, is anything but bright.

As before the provision for defence, history supplies us with numerous illustrations. The most conspicuous, perhaps, is the elaborate series of fortifications which were constructed by Vauban for the defence of France; and there can be no question that Louis XIV., in erecting this mighty barrier against invasion, gave proof of statesmanlike foresight of no mean order. An instance less familiar, perhaps, but even more creditable to the brain which conceived it, was Wellington's preparation of Portugal in 1809-1811. Not only did the impregnable stronghold of Torres Vedras, covering Lisbon, and securing for the sea-power an open door to the continent of Europe, rise as if by magic from the earth, but the whole theatre of war was so dealt with that the defending army could operate wherever opportunity might offer. No less than twenty supply depots were established on different lines of the advance. Fortifications protected the principal magazines. Bridges were restored and roads improved. Waterways were opened up, and flotillas organized; and three auxiliary bases were formed on the shores of the Atlantic. Again, the famous "quadrilaterals" of Lombardy and Rumelia have more than fulfilled the purpose for which they were built; and both Austria and Turkey owe much to the fortresses which so long protected their vulnerable points. Nor has the neglect of preparation failed to exert a powerful effect. Moltke has told us that the railway system of Germany before 1870 had been developed without regard to strategic considerations. Yet the fact remains that it was far better adapted both for offence and defence than those of Austria and France; and, at the same time, it can hardly be denied that the unprovided state of the great French fortresses exercised an evil influence on French strategy. Both Metz and Strasbourg were so far from forming strong points of manoeuvres, and thus aiding the operations of the field armies, that they required those armies for their protection; and the retreat on Metz, which removed Bazaine's army from the direct road to Paris and placed it out of touch with its supports, was mainly due to the unfinished outworks and deficient armament of the virgin city. Since 1870 it has been recognized that preparation of the theatre of war is one of the first duties of a government. Every frontier of continental Europe is covered by a chain of entrenched camps. The great arsenals are almost fortified and strongly structured; and both Austrians and Turks have become able to say to new railways as to old, that the lines of communication, whether by water or by land, are adequately protected from all hostile enterprises.

We now come to the importance of close concert between strategy and diplomacy. On the continent of Europe they can easily keep pace, for the theatre of war is always within easy reach. But when the ocean intervenes, and between two hostile states it is undoubtedly difficult to time an ultimatum so that a sufficient armed force shall be at hand to enforce it, and to declare beforehand that it is impossible to negotiate in good faith at the point where the ultimatum is to be accepted, it is not even theoretically possible. The expedition to Copenhagen in 1807, when the British ultimatum was presented by an army of 37,000 men carried on 300 transports, would appear to traverse this statement. But at the beginning of the 20th century an army and a fleet of such magnitude could neither be assembled nor despatched without the whole world being cognizant. It is thus perfectly true that an appreciable period of time must elapse between the breaking off of negotiations and the appearance on the scene of an invading army. Events may march so fast that the statesman's hand may be forced before the army has embarked. But because a powerful blow cannot at once be struck, it by no means follows that the delivery or the receipt of an ultimatum should at once produce a dangerous situation. Dewey's brilliant victory at Manila lost
the greater part of its effect because the United States Government was unable to follow up the blow by landing a sufficient force. Exactly the same thing occurred in Egypt in 1882. The only results of the bombardment of Alexandria were the destruction of the city, the massacre of the Christian inhabitants, the encouragement of the rebels, who, when the ships drew off, came to the natural conclusion that Great Britain was powerless on land. Again, in 1899 the invading Boers found the fortresses unfortified and their march opposed by an inadequate force. It is essential, therefore, that when the hostile acclamation, despised and scorned, the most careful precautions should be taken to ward off the chance of an initial disaster. And such precautions are always possible. It is hardly conceivable, for instance, that a great maritime power, with Cyprus as a place d'armes, could not have placed enough transports behind the fleet to hold a sufficient garrison for Alexandria, and thus have saved the city from destruction. Nor in the case of a distant province being threatened is there the smallest reason that the garrison of the province should be exposed to the risk of a reverse before it is reinforced. It may even be necessary to abandon it altogether to secure strong places, to secure the lines of communication, to establish ample magazines, to organize local forces, to assemble a fleet of transports, and to keep a large body of troops ready to embark at a moment's notice. But there is no reason, except expense, that all this should not be done directly it becomes clear that war is probable, and that it should not be done without attracting public attention. In this way strategy may easily keep pace with diplomacy; and all that is wanted is the exercise of ordinary foresight, a careful study of the theatre of war, a knowledge of the enemy's forces and a resolute determination, despite some temporary inconvenience and the outcry of a thoughtless public, to give the enemy no chance of claiming first blood. The Franco-German War supplies a striking example. Moltke's original intention was to assemble the German armies on the western frontier. The French, he thought, inferior in numbers and but half prepared, would probably assemble as far back as the Moselle. But, as so often happens in war, the enemy did what he was least expected to do. Hastily leaving their garrisons, the French regiments rushed forward to the Saar. The excitement in Germany was great; and even soldiers of reputations abandoned her, to secure the mobilization of the army was still unfinished, demanded that such troops as were available should be hurried forward to protect the rich provinces which lie between the Saar and Rhine. But the chief of the staff became as deaf as he was silent. Not a single company was despatched to reinforce the slender garrisons of the frontier towns; and those garrisons were ordered to retire, destroying railways and removing rolling-stock, directly the enemy should cross the boundary. Moltke's foresight had embraced every possible contingency. The action of the French, improbable as it was deemed, had still been provided against; and, in accordance with time-tables drawn up long beforehand, the German army was disentrenched on the Rhine instead of on the Saar. Ninety miles of German territory were thus laid open to the enemy; but the temporary surrender of the border provinces, in the opinion of the great strategist, was a very minor evil compared with the disasters, military and political, that would have resulted from an attempt to hold them.

It is hardly necessary to observe that no civilian minister, however deeply he might have studied the art of war, could be expected to solve for himself the strategical problems which came before him. In default of practical knowledge, it would be as impossible for him to decide where garrisons should be stationed, what fortifications were necessary, what roads should be constructed, or how the lines of communication should be protected, as to frame a plan of campaign for the invasion of a hostile state. His foresight, his prevision of the accidents inevitable in war, would necessarily be far inferior to those of men who had spent their lives in applying strategical principles to concrete cases; and it is exceedingly unlikely that he would be as prolific of strategical expediens as those familiar with their employment. Nevertheless, a minister of war cannot divest himself of his responsibility for the conduct of military operations. In the first place, he is directly responsible that plans of campaign to meet every possible contingency are worked out in time of peace. In the second place, he is directly responsible that the advice on which he acts should be the best procurable. It is essential, therefore, that he should be capable of forming an independent opinion on the merits of the military projects which may be tendered to him, and that his answers to the ministers of war is the result of his own examination and not the work of a bureau.

The French Directory had sufficient sense to accept Napoleon's project for the campaign of Italy in 1796. In the third place, strategy cannot move altogether untrammelled by politics and finance. But political and financial considerations may not present themselves in quite the same light to the soldier as to the statesman, and the latter is bound to make certain that they have received due attention. If, however, modifications are necessary, they should be made before the plan of campaign is finally approved; and in any case the purely military considerations should be most carefully weighed. It should be remembered that an unfavourable political situation is best redeemed by a decisive victory, while a reverse will do more to shake confidence in the Government than even the temporary surrender of some portion of the national domains. “Be sure before striking” and Remerci pour mieux sauver are both admirable maxims; but their practical application requires a thorough appreciation of the true principles of war, and a very large degree of moral courage, both in the soldier who suggests and in the statesman who approves. If, however, the soldier and the statesman are supported by an enlightened public, sufficiently acquainted with war to realize that patience is to be preferred to precipitation, that retreat, though inglorious, is not necessarily humiliating, their task is very considerably lightened. Nothing is more significant than a comparison between the Paris press in 1870 and the American Confederate press in 1864. In the one case, even after the disastrous results of the first encounters had proved the superior strength and readiness of the enemy, the French people, with all the heat of presumptuous ignorance, cried out for more battles, for an immediate offensive, for a desperate defence of the frontier provinces. So fierce was their clamour that both the generals and the government hesitated, until it was too late, to advise the retreat of Bazaine's army; and when that army had been cut off at Metz, the pressure of public opinion was so great that the last reserve of France was despatched to Sedan on one of the maddest enterprises ever undertaken by a civilized state. In 1864, on the other hand, while Lee in Virginia and Johnston in the west were retreating from position to position, and the huge hosts of the Union were gradually converging on the very heart of the Confederacy, the Southern press, aware that every backward step made the Federal task more difficult, had nothing but praise for the caution which controlled the movements of their armies. But the Southern press, in three crowded years of conflict, had learned something of war. In 1866 and 1870 the German press was so carefully muzzled that even had there been occasion it could have done nothing to prejudice public opinion. Thus both the sovereign and the generals were backed by the popular support which they so richly merited; and it may be remarked that the relations between the army and the government were characterized by a harmony which has been seldom seen. The old king, in his dual capacity as head of the state and commander-in-chief, had the last word to say, not only in the selection of the superior officers, but in approving every important operation. With an adviser like Moltke at his elbow, it might appear that these were mere matters of form. Moltke, however, assures us that the king was by no means a figurehead. Although most careful not to assert his authority in a way that would embarrass his chief of staff, and always ready to yield, on his own judgment.
to sound reasons, he expressed, nevertheless, a perfectly independent opinion on every proposal placed before him, and on very many occasions made most useful suggestions. And at the same time, while systematically refraining from all interference after military operations had once begun, he never permitted military considerations to override the demands of policy. In 1866, when it was manifestly of the first importance, and a military point of view, that the Prussian army strain was concentrated in a position which would enable it to cross the border immediately war was declared, the political situation was so strained that it was even more important to prevent the enemy from setting foot at any single point on Prussian territory. The army, in consequence, was dispersed instead of being concentrated, and the ultimate offensive became a difficult and hazardous operation. It is true that the king was an able and experienced soldier. Nevertheless, the wise restraint he displayed in the conduct of great campaigns, as well as the skill with which he adjusted conflicting factors, are an admirable example of judicious statesmanship.

The duration of a campaign is largely affected by the deadly properties of modern firearms. It is true that the losses in battle are relatively less that in the days of Brown Bess and the smooth-bore cannon, and almost insignificant when compared with the fearful carnage wrought by sword and spear. The reason is simple. A battlefield in the old days, except at close quarters, was a comparatively safe locality, and the greater part of the troops engaged were seldom exposed to a steady fire from either a hot and continuous fire. To-day death has a far wider range, and the strain on the nerves is consequently far more severe. Demoralization, therefore, sets in at an earlier period, and it is more complete. When troops once realize their inferiority, they can no longer be depended on. It is not the losses they have actually suffered, but those that they expect to suffer, that affect them. Unless discipline and national spirit are of superior quality, unless the soldier is animated by something higher than the mere habit of mechanical obedience, panic, shrieking and wholesale surrender will be the ordinary features of a campaign. These phenomena made themselves apparent, though in a less degree, as long ago as the American Civil War, when the weapon of the infantry was the muzzle-loading rifle, firing at most two rounds a minute, and when the projectiles of the artillery were hardly more destructive than the stone shot of Mons Meg. With the magazine rifle, machine guns, shrapnel and high explosives they have become more pronounced than ever at Vionville or Plevna. "The retreat of the 38th (Prussian) Brigade," writes Captain Hoenig, "an eye-witness of the former battle, 1 forms the most awful drama of the great war. It had lost 55 per cent of its strength, and the proportion of killed to wounded was as 3 to 4. Strong men collapsed inanimately... I saw men cry like children, others fell prone without a sound; in most the need of water thrust forth all other instincts; the body demanded its rights. 'Water, water,' was the only intelligible cry that broke from those moving phantoms. The enemy's lead poured like hail upon the wretched remnant of the brigade; yet they moved only slowly to the rear, their head bent in utter weariness; their features distorted under the thick dust that had got into their hair and clothes, so that they were beyond endurance. The soldier was no longer a receptive being; he was oblivious of everything, great or small. His comrades or his superiors he no longer recognized; and yet he was the same man who but a short time before had marched across the battlefield shouting his marching chorus. A few active squadrons, and not a man would have escaped! Only he who had seen men in such circumstances, and observed their bearing, knows the dreadful imprint that their features leave upon the memory. Madness is there, the madness that arises from bodily exhaustion combined with the most abject terror. I do not shrink," he adds, "from confessing that the fire of Mars-la-Tour affected my nerves for months."

If such are the results of ill-success, a whole army might be reduced to the condition of the 38th Brigade in the first month of the campaign, and it is thus perfectly clear that some small mistake in conduct, some trifling deficiency in preparation, an ill-conceived order or a few hours' delay in bringing up a reinforcement may have the most terrible consequences.

The importance, nay the necessity, that the people, as a governing body, should keep as watchful an eye on its armed forces as on diplomacy or legislation is fully realized. Naturally enough, only by those who instinctively feel the value of self-defence, by reason of the configuration of their fronts or their political situation, are strongly developed. Yet even to maritime empires, to Great Britain or indeed to the United States, an efficient army is of the first necessity. Their land frontiers are vulnerable. They may have to deal with rebellion, and a navy is not all-powerful, even for the defence of coasts and commerce. It can protect, but it cannot destroy. Without the help of an army, it can neither complete the ruin of the enemy's fleet nor prevent its resuscitation. Without the help of an army it can hardly force a hostile power to ask for terms. Exhaustion is the object of its warfare; but exhaustion, unless accelerated by crushing blows, is an exceedingly slow process.

In the spring of 1861 the blockade was established in American waters along the coasts of the Southern Confederacy, and maintained with increasing stringency from month to month. Yet it was not till the spring of 1865 that the colours of the Union floated from the capitol of Richmond, and it was the army which placed them there. A state, then, which should rely for naval defence on mere geography; it is one long illustration. Captain Mahan points out that there are always dominant positions, outside the frontiers of a maritime state, which, in the interests of commerce, as well as of supremacy at sea, should never be allowed to pass into the possession of a powerful neighbour. Great Britain, always dependent for her prosperity on narrow seas, has long been familiar with the importance of the positions that command these waterways. In one respect at least her policy has been consistent. She has spared no effort to secure such positions for herself, or, if that had been impracticable, at least to draw the teeth. The position of the Ionian Islands, Malta, Egypt, Cyprus are conspicuous instances; but above all stands Antwerp. In perhaps the most original passage of Alison's monumental work the constant influence of Antwerp on the destinies of the United Kingdom is vividly portrayed. "Nature has framed the Scheldt to be the rival of the Thames. Flowing through a country excelling even the midland counties of England in wealth and resources, adjoining cities equal to any in Europe in arts and commerce; the artery at once of Flanders and Holland, of Brabant and Luxembourg, it is fitted to be the great organ of communication between the fertile fields and rich manufacturing towns of the Low Countries and other maritime states of the world." Antwerp, moreover, the key of the great estuary, is eminently adapted for the establishment of a vast naval arsenal, such as it became under Philip II. of
WAR

Spain and again under the first Napoleon. "It is the point," continues the historian, "from which in every age the independence of these kingdoms has been seriously menaced. Sensible of her danger, it had been the fixed policy of Great Britain for centuries to prevent this formidable outwork from falling into the hands of her enemies, and the best days of her history are chiefly occupied with the struggle to ward off such a disaster."

In ascribing, however, every great war in which Great Britain has been engaged to this cause alone, he has gone too far. The security of India has been a motive of equal strength. Nevertheless, it was to protect Antwerp from the French that Charles II. sided with the Dutch in 1670; that Anne declared war on Louis XIV. in 1704; that Chatham supported Prussia in 1742; that Pitt, fifty years later, took up arms against the Revolution. The trophies of the British army in the great war with France were characteristic of the amphibious power. The troops took more battleships than colours, and almost as many naval arsenal as land fortresses. Many were the blows they struck at the maritime strength of France and her allies; but had the expedition which landed on the Isle of Walcheren in 1809 been as vigorously conducted as it was wisely conceived, it would have hit Napoleon far harder than even the seizure of the Danish fleet at Copenhagen. The great dockyard that the emperor had constructed on the Scheldt held the nucleus of a powerful fleet. Eight line-of-battle ships and ten frigates lay in mid-channel. Twenty vessels of different classes were on the slips, and in the magazines and storehouses had been accumulated sufficient material to equip all these and twenty more. The destruction of Antwerp — and for a full week it was at Lord Chatham's mercy — would have freed scores of British frigates to protect British commerce; Wellington, in his great campaign of 1813, could not have had to complain that, for the first time, the communication by sea of a British army was insecure; the Americans, in the war which broke out in 1812, would have been more vigorously opposed; and Napoleon, who, while Antwerp was his, never altogether abandoned hope of overmastering Great Britain on her own element, might, on his own confession, have relinquished the useless struggle with the great sea power. The expedition failed, and failed disastrously. But for all that, fulfilling as it did the great maxim that the naval strength of the enemy should be the first objective of the forces of the maritime power, both by land and sea, it was a strategical stroke of the highest order.

The predominant part played by the army under Wellington in Spain and Belgium has tended to obscure the principle that governed its employment in the war of 1793-1815. The army, in the opinion of the country, was first and foremost the auxiliary of the fleet; and only when the naval strength of the enemy had been destroyed was it used in the ordinary manner as, for instance, in the invasion of the hostile territory and in lending aid to the forces of confederate powers. Events proved that these principles were absolutely sound. It was not in the narrow seas alone that the army rendered good service to the navy. Depriving France of her colonies, occupying her ports in foreign waters, cutting her from commanding posts along the trade routes, it contributed not only to her exhaustion, but to the protection of British commerce and to the permanent establishment of maritime supremacy. Few of these operations are of sufficient magnitude to attract much notice from the ordinary historian, yet it is impossible to overrate their effect. To the possession of the dominant positions that were captured by the army, Great Britain, in no small degree, is indebted for the present security of her vast dominions. The keynote of the fierce struggle with the French Empire was the possession of India. Before he became First Consul, Napoleon had realized that India was the throne of Asia; that whoever should sit on that throne, master of the commerce of the East, of the richest and most natural market for the products of the West, and of the hardest and most enlightened tribe, would be master of more than half the globe. But his prescience was not sure than the instinct of the British people. Vague and shadowy indeed were their dreams of empire, yet the presentiment of future greatness, based on the foothold they had already gained in Hindustan, seems always to have controlled the national policy. They knew as well as Napoleon that Malta and Egypt, to use his own phrase, were merely the outworks of their stronghold in the East; and that if those outworks fell into the hands of France, a great army of warlike Mahomedans, led by French generals, stiffened by a French army corps, and gathering impetus from the accession of every tribe it passed through, might march unopposed across the Indus. So, from first to last, the least threat against Egypt and Malta sufficed to awaken their apprehensions; and in their knowledge that India was the ultimate objective of all his schemes is to be found the explanation of the stubbornness with which they fought Napoleon. It is not to be denied that in thwarting the ambition of their mighty rival, or perhaps in furthering their own, the navy was the chief instrument; but in thrusting the French from Egypt, in adding Ceylon, Mauritius and Cape Colony to the outworks, the army, small as it was then, compared with the great hosts of the Continent, did much both for the making and the security of the British Empire.

But the scope of the military operations of a maritime state is by no means limited to the capture of colonies, naval arsenals and coaling-stations. Timely diversions, by attracting a large portion of the enemy's fighting strength on the mainland, may give valuable aid to the armies of an ally. The Peninsular War is a conspicuous example. According to Napoleon, the necessity of maintaining his grip on Spain deprived him of 180,000 good soldiers during the disastrous campaign of 1813; and those soldiers, who would have made Dresden a decisive instead of a barren victory, were held fast by Wellington. Again, it was the news of Vittoria that made it useless for the emperor to propose terms of peace, and so escape from the coils that strangled him at Leipzig.

Nor is the reinforcement supplied by a small army based upon the sea to be despised. In 1793 a British contingent under the duke of York formed part of the allied forces which, had the British government forborne to interfere, would in all probability have captured Paris. Twenty-two years later, under wiser auspices, another contingent, although numbering no more than 30,000 men, took a decisive part in the war of nations, and the blunders of the older generation were more than repaired at Waterloo. Nevertheless, the strength of the amphibious power has been more effectively displayed than in the campaign of 1815. Intervention at the most critical period of a war has produced greater results than the provision of a contingent at the outset. In 1781 the disembarkation of a French army at Yorktown, Virginia, rendered certain the independence of the United States; and in 1812, when the Russian invaders were advancing north of Constantinople, the arrival of the British fleet in the Dardanelles, following the mobilization of an expeditionary force, at once arrested their further progress. Had the British Cabinet of 1807 realized the preponderating strength which even a small army, if rightly used, draws from the command of the sea, the campaign of Eylau would in all probability have been as disastrous to Napoleon as that of Leipzig. The presence of 20,000 men at the great battle would have surely turned the scale in favour of the allies. Yet, although the men were available, although a few months later 27,000 were assembled in the Baltic for the coercion of Denmark, his Majesty's ministers, with the exception of Marlborough's glories, were so imbued with the idea that the British army was too insignificant to take part in a Continental war, that the opportunity was let slip. It is a sufficiently remarkable fact that the successive governments of that era, although they realized very clearly that the first duty of the army was to support the operations and complete the triumph of the navy, never seemed to have grasped the principles which should have controlled its use when the command of the sea had been attained. The march of the Allies on Paris in 1793 was brought to a standstill because the British Cabinet considered that the contingent would be better employed in besieging Dunkirk. After the failure of the expedition
under Sir John Moore to achieve the impossible, and in conjunction with the Spaniards drive the French from the Peninsula, the ministry abandoned all idea of intervention on the main theatre, although, as we have seen, had such intervention been well timed, it might easily have changed the current of events. It is true that when the main theatre is occupied by huge armies, as was the case during the whole of the Napoleonic conflict, the value of a comparatively small force, however, sudden its appearance, is only realized by the enemy. For instance, it would seem at first sight that a British contingent of 100,000 men would be almost lost amid the millions that would take part in the decisive conflicts of a European war. It is remembered, however, that with enormous masses of men the difficulties of supply are very great. Steam has done much to lighten them, and the numbers at the point of collision will be far greater than it was possible to assemble in the days of Napoleon. Nevertheless, the lines of communication, especially railways, will require more men to guard them than heretofore, for they are far more vulnerable. The longer, therefore, the lines of communication, the smaller the numbers on the field of battle. Moreover, the great hosts of the Continent, not only for convenience of supply, but for convenience of manœuvre, will deploy several armies on a broad front. At some one point, then, a reinforcement of even one or two army corps might turn the scale.

The objections, however, to intervention of this character are numerous. Between allied armies, especially if one is far larger than the other, there is certain to be friction, as was the case in the Crimea; and the question of supply is not easily settled. If, however, the decisive point is near the coast, as in the campaign of Eyland, the army of the maritime power, possessing its own base, can render effective aid without embarrassment either to itself or its ally. But, under all other conditions, independent operations of a secondary nature are distinctly to be preferred. Such was clearly the opinion of the British ministries during the war with France. They recognized that by giving vitality and backbone to popular risings even a small army might create useful diversions. But their idea of a diversion was a series of isolated efforts, made at far-distant points; and even so late as 1813 they were oblivious of the self-evident facts that for a diversion to be really effective it must be made in such strength as to constitute a serious threat, and that it should be directed against some vital point. Fortunately for Europe, Wellington foresaw that the permanent occupation of Portugal, and the presence of a British army in close proximity to the southern frontier of France, would be a menace which it would be impossible for Napoleon to disregard. Yet with what difficulty he induced the government to adopt his views, and how lukewarm was their support, is exposed in the many volumes of his despatches. In all history there are few more glaring instances of incompetent statesmanship than the proposal of the cabinet of 1813, at the moment Wellington was contemplating the campaign that was to expel the French from Spain, and was asking for more men, more money and more material, to detach a large force in the vague hope of exciting a revolution in southern Italy. Whether the improvement in communications, as well as the increase in the size of armies, have not greatly weakened the value of diversions on the mainland, it is difficult to say. Railways may enable the defender to concentrate his forces so rapidly that even the landing may be opposed, and with the enormous numbers at his command he may well be able to spare a considerable force from the main theatre. It is possible to conceive that a small army, even if it completed its embarkation, might find itself shut up in an entrenched position by a force little larger than itself. If, however, the diversions were made at a crisis of the campaign, the sudden appearance of a new army might be decisive of the war. Otherwise, the army would probably do more good if it refrained from landing and concentrated on the real threats. So long as it was hidden by the horizon, it would be wasted as the key to a fort. The enemy's knowledge that at any moment a well-equipped force, supported by a powerful fleet, might suddenly descend upon some prosperous port or important arsenal, would compel him to maintain large garrisons along the whole seaboard. The strength of these garrisons, in all probability, would be much larger in the aggregate than the force which menaced them, and the latter would thus exercise a far greater disintegrating effect on the enemy's armed strength than by adding a few thousand men to the hosts of its ally. On theatres of war which are only thinly populated or half civilized, a descent from the mountains would make a complete change in the situation. The occupation of Plevna, in close proximity to the Russian line of communications and to the single bridge across the Danube, brought the Russian advance through Bulgaria to a sudden stop, and relieved all pressure on Turkey proper. The deadlock which ensued is suggestive. Let us suppose that the invaders' line of communications had been a railway, and Plevna situated near the coast. Supplied from the sea, with unlimited facilities for reinforcement, Osman's ring of earthworks would have been absolutely impregnable; and had the ring been pushed the Inland as to secure scope for operation, then, as Napoleon, in all human probability, would never have crossed the Balkans. It is perfectly possible, then, that if an army lands within reach of a precarious line of communications it may compel the enemy, although far superior in numbers, to renounce all enterprises against distant points.

Railways in war are good servants, but bad masters. In some respects they are far superior to a network of highways. Two trains will supply the daily needs of 100,000 men, several hundred miles distant from their base. But the road-bed is easily destroyed; the convey system is impracticable if the road-bed is not there. Indeed, the regular course of traffic is susceptible to the slightest threat. So, when railways become the principal factors, as when an army finds itself dependent on a long and exposed line, a powerful aggressive combination becomes a matter of the utmost difficulty. The whole attention of the commander will be given to the security of his supplies, and even if he is not thrown on the defensive by the enemy's activity, his liberty of action will be exceedingly circumscribed. The relative values of the different kinds of communications have a most important bearing on the art of war. A great waterway, such as the Nile, the Mississippi, the Danube or the Ganges, is safer and surer than a railway. But railways are far more numerous than navigable rivers, and a series of parallel lines is a better means of supplying a large army. But neither railways nor waterways as lines of supply or of operation are to be compared with the sea. Before the war of 1870, for instance, a study of the French railway system enabled Moltke to forecast, with absolute accuracy, the direction of Napoleon's advance, the distribution of his forces, and the extent of front that they would occupy. In a war, therefore, between two Continental powers, the staff on either side would have no difficulty in determining the line of attack; the locality for concentration would be at once made clear; and as the carrying capacity of all railways is well known, the numbers that would be encountered at any one point along the front might be easily calculated. But if the enemy's army, supported by a powerful fleet, were to advance across blue water, the case would be very different. Its movements would be veiled in the most complete secrecy. It would be impossible to do more than guess at its objective. It might strike at any point along hundreds of miles of coast, or it might shift from one point to another, perhaps far distant, in absolute security; it could bewilder the enemy with feints, and cause him to disperse his forces over the whole seaboard. Surprise and freedom of movement are pre-eminently the weapons of the power that commands the sea. Witness the War of Secession. McClellan, in 1862, by the adroit transfer of 120,000 men down the reaches of Chesapeake to the Virginia Peninsula, had Richmond at his mercy. Grant in 1864, by continually changing his line of communication from one river to another, made his progress of himself, in two years. Sherman's great march across Georgia would have been impossible, had not a Federal fleet been ready to receive him when he reached
the Atlantic; and, throughout the war, the knowledge that at any moment a vast fleet of transports might appear off any one of the ports on their enormous seaboard prevented the Confederates, notwithstanding that the garrisons were reduced to a most dangerous extent, from massing their full strength for a decisive effort.

The power of striking like "a bolt from the blue" is of the very greatest value in war. Surprise was the foundation of almost all the great strategical combinations of the past, as it will be of those to come. The first thought and the last of the great general is to outwit his adversary, and to strike where he least expected. And the measured approach to accomplish his purpose are not easily divined.

What soldier in Europe anticipated Marlborough's march to the Danube and Blenheim field? What other brain besides Napoleon's dreamt of the passage of the Alps before Marengo? Was there a single general of Prussia before Jena who foresaw that the French would march north from the Bavarian frontier, uncovering the roads to the Rhine, and risking utter destruction in case of defeat? Who believed, in the early June of 1815, that an army 130,000 strong would dare to invade a country defended by two armies that mustered over 200,000 unbeaten soldiers? To what Federal soldier did it occur, on the morning of Chancellorsville, that Lee, confronted by 90,000 Northerners, would detach the half of his own small force of 50,000 to attack his enemy in flank and rear? The very course which appeared to ordinary minds so hetet by difficulties and dangers as to be outside the pale of practical strategy has, over and over again, been that which led to decisive victory; and if there is one lesson more valuable than another as regards national defence, it is that preparation cannot be too careful or precautions overdone. Overwhelming numbers, adequately trained, commanded and equipped, are the only means of ensuring absolute security. But a numerical preponderance, either by land or sea, over all possible hostile combinations, is unattainable, and in default the only sound policy is to take timely and ample precautions against all enterprises which are even remotely possible. There is nothing more to be dreaded in war than the combined labours of a thoroughly well-trained general staff, except the intellect and audacity of a great strategist. The ordinary mind, even if it does not shrink from great danger, sees no way of surmounting great difficulties; and any operation which involves both vast dangers and vast difficulties it scoffs at as chimerical. The heaven-born strategist, on the other hand, "takes no counsel of his fears." Knowing that success is seldom to be won without incurring risks, he is always greatly daring; and by the skill with which he overcomes all obstacles, and even uses them, as Hannibal and Napoleon did the Alps, and as some great captain of the future may use the seas, to further his purpose and surprise his adversary, he shows his superiority to the common herd. It is repeated ad nauseam that in consequence of the vastly improved means of transmitting information, surprise on a large scale is no longer to be feared. It is to be remembered, however, that the means of concentrating troops and ships are far speedier than of old; that false information can be far more readily distributed; and also, that if there is one thing more certain than another, it is that the great strategist, surprise being still the most deadly of all weapons, will devote the whole force of his intellect to the problem of bringing it about.

Nor is it to be disguised that amphibious power is a far more terrible weapon than even in the days when it crushed Napoleon. Commerce has increased by leaps and bounds, and it is no longer confined within territorial limits. The arteries vital to the existence of civilized communities stretch over every ocean. States which in 1800 rated their maritime traffic at a few hundred thousand pounds sterling, value it now at many millions. Others, whose flags, fifty years ago, were almost unknown on the high seas, possess to-day great fleets of merchantmen; and those who fifty years ago were self-dependent, rely in great part, for the maintenance of their prosperity, on their intercourse with distant continents. There is no great power, and few small ones, to whom the loss of its sea-borne trade would be other than a most deadly blow; and there is no great power that is not far more vulnerable than when Great Britain, single-handed, held her own against a European coalition. Colonies, commercial ports, dockyards, coaling-stations are so many hostages to fortune. Year by year they become more numerous. Year by year, as commercial rivalry grows more acute, they become more intimately bound up with the prosperity and prestige of their mother-countries. And to what end? To exist as pledges of peace, auspicia mellioris aevi, or to fall an easy prey to the power that is supreme at sea and can strike hard on land?

Even the baldest and briefest discussion of the vast subject of war would be incomplete without some reference to the relative merits of professional and unprofessional soldiers. Voluntary service still holds its ground in the Anglo-Saxon states; and both the United Kingdom and America will have to a great extent to rely, in case of conflicts which tax all their resources, on troops who have neither the practice nor the discipline of their standing forces. And how are those to be recruited and trained against regulars? Putting the question of moral aside, is leading us too far afield, it is clear that the individual amateur must depend upon his training. If, like the Boers, he is a good shot, a good scout, a good skirmer and, if mounted, a good horseman and horsemaster, he is undoubtedly a most useful soldier. But whether amateurs en masse, that is, when organized into battalions and brigades, are thoroughly trustworthy, depends on the quality of their officers. With good officers, and a certain amount of previous training, there is no reason why bodies of infantry, artillery or mounted infantry, composed entirely of unprofessional soldiers, should not do excellent service in the field. Where they are likely to fail is in discipline; and it would appear that at the beginning of a campaign they are more liable to panic, less resolute in attack, less enduring under heavy losses and great hardships, and much slower in manoeuvre than the professionals. To a certain extent this is inevitable; and it has a most important bearing on the value of the citizen soldier, for the beginning of a campaign is a most critical phase. In short, troops who are only half-trained or have been hastily raised may be a positive danger to the army to which they belong; and the shelter of strong rank is the only place for them. Yet the presence of a certain number of experienced fighting men in the ranks may make all the difference; and, in any case, it is probable that battalions composed of unprofessional soldiers, the free citizens of a free and prosperous state, are little if at all inferior, as fighting units, to battalions composed of conscripts. But it is to be understood that the men possess the qualifications referred to above, that the officers are accustomed to command and have a good practical knowledge of their duties in the field. A mob, however patriotic, carrying small-bore rifles is no more likely to hold its own to-day against well-led regulars than did the mob carrying pikes and flint-lock in the past. A small body of resolute civilians, well-armed and skillful marksmen, might easily on their own ground defeat the same number of trained soldiers, especially if the latter were badly led. But in a war of masses, the power of combination, of rapid and orderly movement, and of tactical manœuvring is bound to tell.

WAR

II. LAWS OF WAR

The law of war, in strict usage, does not apply to all armed conflicts, but only to such conflicts as, by the usage of states, constitute war. War exists when the organized armed forces of one state are opposed to the organized armed forces of another state. War also exists within the bounds of a single state when organized armed forces, of sufficient power to make the issue doubtful, place themselves in opposition to the armed forces of the existing government. If the disaffected forces are in a state of flagrant inferiority in comparison with those of the existing government there is not a state of war but of rebellion. The combatants in civil war are entitled to treatment in accordance with the law of war. Rebels, as outlaws, have no rights. In the South African campaign (1899-1902) the question arose whether the manifest inferiority of the Boer forces, the possession by the British forces of the seats of government, and their practical occupation of the whole country, did not put an end to the state of war and constitute the Boer fighting forces rebels against a new existing government which had proclaimed annexation of the conquered states. The action of the British commanders is a precedent in favour of the view that the fighting forces of an invaded state are entitled to belligerent rights, though in a state of hopeless inferiority, so long as they remain in the field in organized bands. In this, as in many cases which have formed international usage, the danger of reprisals more than the logic of principles has dictated a different line of conduct from that which the strict principles of law suggested. A somewhat similar, but more complicated situation, arose out of the cession by Spain to the United States of the Philippine Islands. The insurgents being in possession of them at the time, Spain ceded what she did not in fact possess. Thus it has been contended that the position of the insurgents became that of belligerents defending their country against conquest by invading forces.

Wars have been classed in different ways—wars of intervention, wars of conquest, wars of defence, wars of independence, just wars, unjust wars, and so on; but the law of war applies to them all without distinction. States do not sit as judges over each other, but treat war, subject to their own interest, as a fact. Interest, however, with the development of international relations is becoming a more important factor in the determination of the attitude of the neutral onlooker (see NEUTRALITY).

In the Chino-Japanese War (1894-95) the Japanese had to decide whether the Chinese were entitled to treatment under the European law of war. Japan had acceded to the Geneva Convention (see below) in 1866, and to the Declaration of Paris (see below) in 1857. China was a party to neither, and observed the provisions of neither. Japan, nevertheless, as related by her learned judicial advisers, Professors Ariga and Takahashi, observed towards the Chinese forces, combatant and non-combatant, all the rules of European International Law without resorting to the reprisals to which Chinese barbarities provoked her.

The position of neutral governments towards insurgent forces is always a delicate one. If they are not recognized as belligerents by the state against which they are arrayed, the state in question theoretically accepts responsibility for the consequences of their acts in respect of neutral states. A neutral state may be satisfied with this responsibility, or it may recognize the belligerent character of the insurgents. If, however, it does not, the insurgent forces cannot exercise rights of war against neutral property without exposing themselves to treatment as outlaws and pirates. A case of such treatment occurred in September 1902 in connexion with a then pending revolution in Hayti. A German cruiser, the "Panther", treated an insurgent gunboat, the "Crête-a-Pierrot", as a pirate vessel, and sank her for having stopped and confiscated arms and ammunition found among the cargo of the German steamer

"Markomannia" on the ground that they were contraband destined for the armed forces of the existing Hayitian government. The "Crête-a-Pierrot" had for some years formed part of the Hayitian navy, and was commanded by Admiral Killick, who had been an admiral of that navy. There had been no recognition of the belligerency of the insurgents. No state seems to have made any observations on the incident, which may be taken to be in accordance with current international usage.

A well-known instance of a neutral government recognizing insurgent forces as belligerent, in spite of the denial of that character to them by the state against which they were carrying on hostilities, occurred in the Northern American Civil War. The right asserted by Great Britain to recognize the belligerency of the Confederate forces was based on the contention that British commercial interests were very largely affected by the blockade of the Southern ports. It is agreed, however, among jurists that, where the interests of neighbouring states are not affected, the recognition of an insurgent's belligerency is needless interference.2

2 It is also agreed that, as the existence of belligerency imposes burdens and liabilities upon neutral subjects, a state engaged in civil war has a right in entrenching to effect its warlike object; and that such a proceeding would be an invasion of international law relating to blockade (Hansard, cixii., 1846). Subsequently the government of the United States proposed to adopt the same measure against the ports of the Northern States upon which Lord John Russell wrote to Lord Lyons that "Her Majesty's government entirely concur with the French government in the opinion that a decree closing the Southern ports would be entirely illegal, and that, under an event that recognizes the maxim of law that the ports of a belligerent can only be closed by an effective blockade" (State Papers, North America, No. 1, 1862). In neither case was the order carried out. When in 1892 the British government declared the existence of civil war, declared several ports to be closed without instituting a blockade, Mr T. F. Bayard, Secretary of State of the United States, in a despatch of 24th April of that year, fully acknowledged the general principle of this contention by refusing to acknowledge the closure.

In the Servo-Bulgarian War of 1885 the Sultan, though suzerain of Bulgaria, was unmoved by the invasion of his vassal's dominions.

Neutral interest.

Civil war as distinguished from rebellion.

War with barbarous peoples.

The Times (9th September 1902).
LAWS OF WAR

WAR

civilian population as any longer possible. They have found, to some extent, expression in the following Articles of the Hague War-Regulations:

"Art. 23. The laws, rights and duties of war apply not only to an army, but also to militia and volunteer corps fulfilling the following conditions: (a) To be commanded by a person responsible for his subordinates; (b) to have a fixed distinctive emblem recognized as a military formation, and (c) to carry on their operations in accordance with the laws and customs of war. In countries where militia or volunteer corps constitute the army, or form part of it, they are included under the denomination "army.""

"The only alteration made by the revised Convention of Nov. 27th, 1907, as compared with that of 1899 is the insertion in Art. 2 of the words in italics. By these provisions, irregular combatants whom both the government of the United States in the American Civil War and the German government in the Franco-German War refused to regard as legitimate belligerents, are now made legally so."

"The preamble of the Convention refers specially to Articles 1 and 2 in the following terms: "In the view of the High Contracting Parties, the draft Regulations have been inspired by the desire to diminish the evils of war as far as military necessities permit, are destined to serve as general rules of conduct for belligerents in their relations with each other and with civilians."

"It is not the intention of the drafters, in the present provision, to contemplate a change of the law, or anything to the effect that nothing in the Regulations should be considered as tending to diminish or suppress the right which belongs to the population of an invaded country patriotically to oppose the most energetic resistance by every legitimate means." The whole of this notice was to cause the insertion of a proviso in the preamble of the

Connected with the position of private persons in time of war is that of their property in invaded territory, a subject which has often been misunderstood. Assumptions as to immunity, neutrality or confiscation of the property of those who have been made which are historically inaccurate and are not borne out by contemporary usage. No doubt contemporary usage is an improvement on older usage. An invading army, before the practice of war became more refined, lived by foraging and pillage in the invaded country; pillage, in fact, being one of the inducements held out to the adventurers who formed part of the fighting forces either as officers or as common soldiers, and this continued down to comparatively recent times. Attenuations followed from the rise of standing and regular armies, and the consequent more careful distinction between soldier and civilian. They have now taken the form of systematic requisitions and contributions, the confining of the right of levying these to generals and commanders-in-chief, the institution of quittances or bills drawn by the belligerent invader on the invaded power and handed in payment to the private persons whose movable belongings have been appropriated or used, and of war indemnities. These are methods of lessening the hardships of war as regards the private property on land of the subjects of belligerent states. Their object and effect have by no means been to arrest at all."

"Neither requisitions in kind nor services can be demanded from communes or inhabitants except for the necessities of the army of occupation. They must be in proportion to the resources of the country, and of such a nature as not to involve the population in the obligation of taking part in military operations against their country."

"These requisitions and services shall only be demanded on the authority of the Commander in the locality occupied."

"The contributions in kind shall, as far as possible, be paid for in ready money; if not, their receipt shall be acknowledged and the payment of the amounts due shall be made as soon as possible" (Article 52).

"In another Article provision, moreover, is made for the utilization of property in kind belonging to private persons:"

"An army of occupation can only take possession of the cash, funds and property liable to requisition belonging strictly to the state, depots of arms, means of transport, stores and supplies, by virtue of the law, all movable property of the state which may be used for military operations."

"All appliances, whether on land, at sea, or in the air adapted for the transmission of news, or for the transport of persons or things, for the use of naval law, diplomatic archives, or any other service, all kinds of ammunition of war, may be seized, even if they belong to private individuals, but must be restored and compensation paid when peace is made."

Utilize neutral rolling-stock is not excepted, Article 19 of the Convention on the rights and duties of neutral powers and persons in war on land only providing that:

"The plant of railways coming from neutral states, whether the property of those states, or of companies, or of private persons, and recognizable as such, shall be sent back as soon as possible to the country of origin.""
existing exemptions. The considerations which have led mankind to systematize the practice of war in regard to private property on land do not arise in the same form in connexion with private property at sea. Here there is no question of seizing the live stock, or the bedding, or the food, or the utensils of the private citizen. If ship and cargo are captured, it may be hard upon the merchant, but such captures do not directly deprive him of the necessaries of life. Yet, as in the case of war on land, its hardships have been attenuated, and progress has been made by developing a more systematic procedure of capture of private property at sea. Thus exemption from capture is now allowed by belligerents to enemy merchant ships which, at the outbreak of war, are on the way to one of their ports, and they also allow enemy merchantmen in their ports at its outbreak a certain time to leave them. This is confirmed by the Hague Convention of 1897 on the status of enemy ships on the outbreak of hostilities. A somewhat similar practice exists as regards pursuit of merchant ships which happen to be in a neutral port at the same time with an enemy cruiser. Under the Hague Convention of 1897 respecting the rights and duties of neutral powers in naval war (Art. 16), this, too, is confirmed.

Lastly, there has grown up, on grounds similar to those which have led to the indulgence shown to private property on land, a now generally recognized immunity from capture of small vessels engaged in the coast fisheries, provided they are in no wise made to serve the purposes of war, which also has been duly confirmed in the Hague Conventions of 1907 by Art. 3 of the convention relative to certain restrictions on the exercise of the right of capture in maritime war. This has all been done with the object of making the operations of war systematic, and enabling the private citizen to estimate his risks and take the necessary precautions to avoid capture, and of restricting acts of war to the purpose of bringing it to a speedy conclusion.

We have seen that the only immunity of private property yet known to the laws of war is a limited one at sea. War, by its very nature, seems to prevent the growth of any such immunity. The tendency in war on land has been to spread its effects over the whole community, to keep a faithful record on both sides of all confiscations, appropriations and services enforced against private citizens; beyond this, protection has not yet been extended. There is good reason for this. The object of each belligerent being to break the enemy's power and force him to sue for peace, it may not be enough to defeat him in the open field; it may be necessary to prevent him from repairing his loss both in men and in the munitions of war. This may imply crippling his material resources, trade and manufactures. It has been contended that to capture at sea raw materials used in the manufacturing industry of a belligerent state, or products on the saie of which its prosperity, and therefore its taxable sources depend, is necessarily one of the objects, and one of the least cruel, which the belligerents pursue. To capture the merchant vessels which carry these goods, and even to keep the seamen navigating them prisoners, is to prevent the employment of the ships by the enemy as transports or cruisers, and the repairing from among the seamen of the mercantile marine of losses of men in the official navy. 1

The existence of reform of the existing practice would naturally be viewed in different countries according to their respective interests. The United States has obviously an interest in the exemption of its merchant vessels and cargoes from capture, a small official navy being sufficient for the assertion of its ascendancy on the American continent. It may also be presumed to be in the interest of Italy, who, in a treaty with the United States in 1871, provided for mutual recognition of the exemption.

In the Austro-Prussian war of 1866 the principle of inviolability was adhered to by both parties. Germany proclaimed the same principle in 1870, but afterwards abandoned it.

There is a strong movement in Great Britain in favour of the general adoption of immunity. Whether it may now be expedient for her to agree to such immunity is an open question. It is quite conceivable, however, that different considerations would weigh with her in a war with the United States from those which would arise in a war with France or Germany. In the case of the United States it might be in the interest of both parties to localize the operations of war, and to interfere as little as possible, perhaps for the joint exclusion of neutral vessels, with the traffic across the Atlantic. In the case of Germany, Britain, Great Britain might consider that the closing of the high seas to all traffic by the merchantmen of the enemy would be very much in her own interest.

The converse subject of the treatment of subjects of the one belligerent who remain in the country of the other belligerent also was not dealt with at the Hague. British practice in this matter has always been indulgent, the protection to the persons and property of non-combatant enemies on British soil dating back to Magna Carta (s. 48), and this is still the law of England. The practice in the continent of Europe varies according to circumstances, to which no doubt, in the event of the invasion of Great Britain, British practice would also have to adapt itself.

The Hague War-Regulations deal fully with the treatment of prisoners, and though they add nothing to existing practice, such treatment is no longer in the discretion of the signatory Powers, but is binding on them. They provide as follows:

"Prisoners of war are the property of the hostile government, but not in that of the individuals or corps who captured them. They must be humanely treated. All their personal belongings, except arms, horses and military papers, remain their property (Article 4). Prisoners of war may be interned in a town, fortress, camp or any other locality, and bound not to go beyond certain fixed limits; but they can only be confined as an indispensable means of maintaining security, and under circumstances necessitating this measure shall endure (Article 5). The States may exempt from the rank of prisoners of war according to their rank and aptitude, with the exception of officers. Their tasks shall not be excessive, and shall have regard to their rank and aptitude. They shall do with them as though they were authorized to work for public service, for private persons, or on their own account. Work done for the state shall be paid for according to the tariffs in force for soldiers of the national army employed in similar tasks, or if there are none in force, then according to a tariff suitable to the work executed. When the work is for other branches of the public service or for private persons, the conditions shall be settled in agreement with the military authorities. The wages of the prisoners shall go towards improving their position, and the balance shall be paid them at the time of their release, after deducting the cost of their maintenance (Article 6). The government in whose hands prisoners of war have fallen is bound to treat them without punishment and without difference in the treatment of their fellow-countrymen. They shall be allowed to send and receive letters, and to have a change of clothes, except in case of serious misconduct, and shall be allowed to move about freely in their camp and in the city, whilst engaged in work. They shall be provided with proper accommodation, which shall be kept clean (Art. 7). Their captors shall not be permitted to sell their individual property, or to take away their personal effects. They shall be provided with proper clothing, food, and medical assistance (Art. 8). They shall be treated with all humanity, and not suffer from any hardships but those which circumstances may make unavoidable (Article 9). Those guilty of breaches of this rule shall be punished with their capitons or interned. All prisoners of war shall be released or exchanged in the event of a conclusion of peace (Article 10)."

1 Barclay, "Proposed Immunity of Private Property at Sea from Capture by Enemy," Law Quarterly Review (January 1900).
LAWS OF WAR

WAR

To employ arms, projectiles or material of a nature to cause superfluous injury.

To make improper use of a flag of truce, the national flag or military ensigns and the enemy's uniform, as well as the distinctive badges of the Geneva Convention (Art. 32).

To destroy or seize the enemy's property, unless such destruction or seizure be imperatively demanded by the necessities of war; to attack or bombard towns, villages, habitations or buildings which are not declared.

To pillage a town or place, even when taken by assault.

Ruses of war, or the employment of methods necessary to obtain information about the enemy and the country, on the contrary, are allowed.

A spy is one who, acting clandestinely, or on false pretences, obtains, or seeks to obtain, information in the zone of operations of a belligerent, with the intention of communicating it to the hostile party (the Hague War-Regulations, Art. 29). Thus, soldiers not in disguise who have penetrated into the zone of operations of a hostile army to obtain information are not considered spies. Similarly, the following are not considered spies: soldiers or civilians, carrying out their mission openly, charged with the delivery of despatches destined either for their own army or for that of the enemy. To this class belong likewise individuals sent in balloons to deliver despatches, and generally to maintain communication between both sides, in order to be in communication with persons who, in case of war, may be prisoners of war, and not punishable for his previous acts of espionage.

In sieges and bombardments all necessary steps are to be taken to avoid the destruction of buildings devoted to religion, art, science, and charity, hospitals and places where the sick and wounded are, or their mounts; provided they are not used not the same time for military purposes; but the besieged are to indicate these buildings or places by particular and visible signs and notify them to the assailants.

New Convention respecting bombardments by naval forces was adopted by the Hague Conference of 1907, forbidding the bombardment of undefended "ports, towns, villages, dwellings or buildings," unless after a formal summons the local authorities decline to comply with requisitions for provisions or supplies necessary for the immediate use of the naval force before the place in question. But they may not be bombarded on account of failure to pay money contributions. On the other hand, the prohibition does not apply to military works, depots of arms, &c., or ships of war in a harbour.

Another new Convention adopted at the Hague in 1907 dealt with the laying of automatic submarine contact mines. Its main provisions are as follows:

**To employ poison or poisoned arms.**

**To kill or wound treacherously individuals belonging to the hostile nation or army.**

**To kill or wound an enemy who, having laid down arms but having no longer means of defence, has surrendered at discretion.**

To declare that no quarter will be given.

**Rules of war.**

**Relief societies.**

**Shk and wounded.**

Military hospital-ships, that is to say, ships constructed or assigned by states specially and solely for the purpose of assisting the wounded and sick, the wounded and sick being evacuated and their ships armed, are to be respected and cannot be captured while there are wounded and sick on board.

As regards hospital-ships equipped wholly or in part at the cost of private individuals or officially recognized relief societies, they likewise are to be respected and exempt from capture, provided the belligerent or neutral power to which they belong shall have given them an official commission and notified their names to the hostile powef at the commencement of or during the hostilities, and in any case before they are employed, are to be respected and cannot be captured while there are wounded and sick on board.

The belligerents have the right to control and visit them; they can refuse to help them, order them off, make them take a certain course, and put a commissioner on board; they can even detain them, if important circumstances require it.

The religious, medical or hospital staff of any captured ship is inviolable, and its members cannot be made prisoners of war.

Lastly, neutral merchant ships, yachts or vessels, having, or taking on board, sick, wounded or shipwrecked of the belligerents, cannot be captured for so doing.

The following provisions are also placed by the Hague Regulations on the means of injuring the enemy:

1. It is forbidden:
   - To employ anchored automatic contact mines, except when they are so constructed as to become harmless one hour at most after the person who laid them ceases to control them;
   - To lay anchored automatic contact mines which do not become harmless in case the ship they have been detached from, breaks loose from its moorings;
   - To use torpedoes which do not become harmless when they have missed their mark (Art. 1).

2. It is forbidden to lay automatic contact mines off the coast and ports of the enemy, with the sole object of intercepting commercial shipping (Art. 2).

When anchored automatic contact mines are employed, every possible precaution must be taken for the security of peaceful shipping.

The belligerents undertake to do their utmost to render these mines harmless within a limited time, and, should they cease to be used for defence, to notify the danger zones as soon as military exigencies permit, by a notice addressed to shippers, which must also be communicated to the Governments through the diplomatic channels (Art. 3).

Neutral Powers which lay automatic contact mines off their coasts must observe the same rules and take the same precautions as are imposed on belligerents.

**Neutral Power.**

Neutral Power may inform shippers, by a notice issued in advance, where automatic contact mines have been laid. This notice must be communicated at once to the Governments through the diplomatic channels. In case of the war, the Contracting Powers undertake to do their utmost to remove the mines which they have laid, each Power removing its own mines.

In case of an anchored automatic contact mine laid by one of the belligerents off the coast of the other, their position must be notified to the other party by the Power which laid them, and each Power must proceed with the least possible delay to remove the mines in its own waters. (Art. 5.)

---

1. See, as to Flags of Truce, Art. 32 of the Hague Regulations.
The Contracting Powers which do not at present own perfected mines of the pattern contemplated in the present Convention, and which, consequently, could not at present carry out the rules laid down in Articles 1 and 3, undertake to convert the material of their mines as soon as possible so as to bring it into conformity with the foregoing requirements. (Art. 6.)

Territory is considered as occupied when it is actually under the authority of the hostile army. The authority having passed into the hands of the occupant, the latter takes all possible steps to re-establish public order and safety. Compulsion of the population of occupied territory to take part in military operations against their own country, or even give information respecting the army of the other belligerent, is strictly prohibited. Private property must be respected, save in case of military necessity (Arts. 46 and 47). The property of religious, charitable and educational institutions, and of art and science, even when state property, are assimilated to private property, and all seizure of, and destruction or intentional damage done to such institutions, to historical monuments, works of art or science is prohibited (Art. 46).

Practice as regards declarations of war has hitherto varied. The Franco-Prussian War of 1870 was preceded by a deliberate declaration. In the war between Japan and China there was no declaration. In the Franco-Japanese War (sino-japonaise, Paris, 1896). The delivery of an ultimatum specifying those terms, the compliance with which is demanded within a specified time, is practically a conditional declaration of war which becomes absolute in case of non-compliance. Thus the note communicated by the United States to Spain on 20th April 1898 demanded the "immediate withdrawal of all the land and sea forces from Cuba," and gave Spain three days to accept these terms. On the evening of 22nd April the United States seized the opportunities thus opened. In the case of the Transvaal War, the declaration also took the form of an ultimatum. A special Hague convention adopted at the Conference of 1907 now provides that hostilities "must not commence without previous and explicit warning in the form of a reasoned declaration of war or of an ultimatum with conditional declaration of war." It also provides that the existence of a state of war must be notified to the neutral powers and shall not take effect in regard to them until after the receipt of the notification which may be given by telegraph. Most of the rules of the preceding provision, however, is negatived by the qualification that neutral powers cannot rely on the absence of notification if it is clearly established that they were in fact aware of the existence of a state of war.

Too much confidence must not be placed in regulations concerning the conduct of war. Military necessity, the heat of action, the violence of the feelings which come into play will always at times defeat the most skillfully-combined rules diplomacy can devise. Still, such rules are a sign of conditions of public opinion which serve as a restraint upon the commission of barbarities among civilized peoples. The European operation of the Confederate armies on the "Boxer" rising showed how distance from European criticism tends to lessen that restraint. On the other hand, it was significant that both the United States and Spain, who were not parties to the Declaration of Paris, found themselves, in a war confined to them, under the necessity of observing provisions which the majority of civilized states have agreed to respect. (T.B.A.)

WARANGAL, an ancient town of India, in the Nizam's Dominions or Hyderabad state, 86 m. N.E. of Hyderabad city. It was the capital of a Hindu kingdom in the 12th century, but little remains to denote its former grandeur except a fort and four gateways of a temple of Siva. Warangal has given its name to a district and a division of the state.

WARASDIN (Hungarian, Varads; Croatian, Varaladin), a royal free town of Hungary, and capital of the county of Warasdin, in Croatia-Slavonia; on the right bank of the Drave, 62 m. by rail N.N.E. of Agram. Pop. (1900) 12,930. Warasdin is the seat of a district court, and possesses an old castle, a cathedral and several churches, monasteries and schools. It carries on a brisk trade in timber, wine, fruit, tobacco, spirits, stoneware and silk. Coal is also manufactured here. Several mines in the Warsadin Mountains were worked. The celebrated sulphur baths of Constantins-Bad or Toplitz, known to the Romans as Thermae Constantiane, lie about 10 m. S.

WARBECK, PERKIN (c. 1474-1499), pretender to the throne of England, was the son of Jehan de Werbecue, a poor burgess of Tournay in Flanders and of his wife Katherine de Faro. The exact date of his birth is unknown, but as he represented himself as having been nine years old in 1483, it must have taken place in, or close on, 1474. His confession made at the end of his life was an account of his early years which is to some extent relevant to the oratory of his pretension. There are many other relations whom he mentions have been found in the governmental records of Tournay, and the official description of them agrees with his statements. According to this version, which may be accepted as substantially true, he was brought up at Antwerp by a cousin Jehan Stienbecks, and served a succession of employers as a boy servant. He was for a time with an Englishman John Strewle at Middleburg, and then accompanied Lady Brampton, the wife of an exiled partisan of the house of York, to Portugal. He was for a year employed by a Portuguese knight whom he described as having only one eye, and whom he accompanied to Veza, in the Azores (1490). In 1491 he was in Cork as the servant of a Breton silk merchant Pregent (Pierre Jean) Meno. Ireland was strongly attached to the house of York, and was full of intrigue against King Henry VII. Perkin says that the people seeing him dressed in the silks of his master took him for a person of distinction, and insisted that he must be either the son of George, duke of Clarence, or a bastard of Richard III. He was more or less encouraged by the ears of Desmond and Kildare. The facts are ill recorded, but it is safe to presume that intrigues who wished to disturb the government of Henry VII. did not lack resources. The case of Perkin was, however, more发展阶段, he was at first considered the legal heir of the Yorkists.
WARBLER—WARBURTON, B. E. G. 317

two or three small vessels, and accompanied by his wife, who had borne him one or two children. After some obscure adventures in Ireland, he landed at Whitesand Bay, near the Land's End, on the 7th of September, and there he found it very a cold认识 in the country, and that he had lately been recently in revolt against excessive taxation. He advanced to Exeter, but was unable to master the town. On the approach of the royal troops he deserted his followers, and ran for refuge to the sanctuary of Beaulieu in Hampshire. He then surrendered. His wife was kindly treated and placed in the household of Henry's queen Elizabeth. Perkin was compelled to make two ignominious public confessions at Westminster, and in Cheapside on the 15th and 16th of June 1498. On the 23rd of November 1490 he was hanged on a charge of endeavouring to escape from the Tower with the imprisoned earl of Warwick.

WARBLER, in ornithology, the name bestowed in 1773 by T. Pennant (Genera of Birds, p. 32) on the birds removed, in 1759, by J. A. Scopoli from the Linnaean genus Motacilla (cf. Wagtail) to one founded and called by him Seriola luxurabi being a word evidently recognized as a valid genus, so that to say, on all the species of Motacilla which were not wagtails. "Warbler" has long been used by English technical writers as the equivalent of Sylvia, and is now applied to all members of the sub-family Sylviinae of the thrushes (g.v.), and in the combination "American warblers" to the distinctive passerine family Mniotilidae. The true warblers (Sylviinae) are generally smaller than the true thrushes Turdinae (see Thrushes), with, for the most part, a weak and slender bill. They seldom fly far, except when migrating, but frequent undergrowth and herbage, living on insects, larvae and fruits. The song is unusually clear and a true sound, as in the grasshopper warbler. The nest is usually cup-shaped and well lined, and from three to six eggs (twelve in Regulus), usually spotted, are laid.

The true warblers are chiefly Old World, visiting the southern Old World in winter, but members of the sub-family occur in New Zealand, Polynesia and Panama. Amongst the commonest in England is the well-known sedge-bird or sedge-warbler, Acrocephalus schoenobaenus, whose chattering song resounds in summer-time from almost every wet ditch in most parts of Britain. As is the case with so many warblers, the warbling habits of the bird cause it to be far more often heard than seen; but, with a little patience, it may be generally observed flitting about the uppermost twigs of the bushes it frequents, and back and forth between the edges of ditches over its eye serve to distinguish it from its ally the reed-wren or reed-warbler, A. streperus, which is clad in a wholly mouse-coloured suit. But this last can also be recognized by its different song pattern and by never betraying its presence; thus the reed-wars and its favourite haunts. In them generally it builds one of the most beautiful of nests, made of the seed-branches of the reed and long grass, woven together, and suspended so as to include its subject the living stems of three or four reeds, between which it is suspended at a convenient height above the water, and the structure is so deep that the eggs do not roll out when its props are shaken by the wind. Of very similar habits is the reed-thrush or great reed warbler, A. arundinaceus, a loud-voiced species, abundant on the Continent but very rarely straying to England. Much interest also attaches to the species known as Sav's warbler, Locustella savii, one of the few species possessing as a constant inhabitant of the Fen district of England a few years before its haunts were destroyed by drainage. The last example known to have been obtained in this country was killed in 1856. The nest of this species is peculiarly placed on the ground and formed of the blades of a species of Glyceria so skillfully woven as to be a very permanent structure, and it is a curious fact that its nests were well known to the sedge-cutters of the district which it most frequented, and amongst these bird with its eggs were unacquainted, long before the builder was recognized by naturalists. In coloration the bird somewhat resembles a nightingale (whose it is especially), and it is from the front its name being unmeaning, being a long smooth tripli, pitched higher possessing more tone than that of the grasshopper-warbler Locustella naevius—which is a widely-distributed species throughout the British Isles—who had been kept for a time from the birds before mentioned, being a long smooth tripli, pitched higher possessing more tone than that of the grasshopper-warbler Locustella naevius—which is a widely-distributed species throughout the British Isles. True warblers are generally of the class of the American warblers, a distinction of which the American and European genera, such as the willow- and wood-wrens under Wren. The Australian genus Malurus, to which belong the birds known as "superb warblers," not inaptly so named, since in beauty they surpass any other of the genus, is allied to the Old World fly-catchers in the family Muscicapidae. Part of the plumage of the cocks in breeding-dress is generally some shade of intense blue, and is so glossy as to resemble enamel, while in the females, and as well as green and lilac, are also present in one species or another, so as to heighten the effect. But, as already stated, there are systematists who would raise this genus, which contains some 15 species but 5 species of a distinct family, though on what grounds it is hard to say.

The birds known as "American warblers," forming what is now recognized as a distinct family, Mniotilidae, remain for considerations. The family includes only a single genus, Mniotilus, which is peculiar to the New World. More than 130 species have been described, and these have been grouped in 20 genera or more, of which the larger are at home in North and South America and in the West Indies. As a whole they are much more brightly coloured than the Sylviae, for, though the particular genus Mniotilus (from which the family takes its name) is one of the most aboriginal—its present range is from the Baltic and Alpine plains to the ocean, and to which a tree-creeper (g.v.)—in other groups chestnut, bluish-grey and green appear, the last varying from an olive to a saloon tint, and in some groups the yellow predominates to an extent that has been called that of "golden" warblers. In the genus Setophaga, the members of which deserve to be called "fly-catching" warblers, the plumage of the male is more present, yellow, orange, scarlet or scarlet and as well as green and lilac, are also present in one species or another, so as to heighten the effect. But, as already stated, there are systematists who would raise this genus, which contains some 15 species but 5 species of a distinct family, though on what grounds it is hard to say.

WARBURTON, COLONEL SIR ROBERT (1842–1890), Anglo-Indian soldier and administrator, was the son of an artillery officer who had been taken prisoner at Kabul in 1842, and escaped through the good offices of an Afghan princess. He married this lady, and she transmitted to their son that power of exercising influence over the tribes of the north-west frontier which stood him in good stead during his long service in India. Warburton entered the Royal Artillery in 1861, took part in the Abyssinian War of 1867–68, and then joined the Bengal Staff Corps. He served with distinction in the expedition against the Utman Khel in 1878 and in the Afghan War of 1878–80. Very soon after the British government had made permanent arrangements for keeping open the Khyber Pass, Warburton was appointed to take charge of it as political officer. This post he held, discharging its duties with conspicuous ability, between 1879 and 1882 with intervals of other duty, and continuously from 1882 until 1890. He turned the rude levies which formed the Khyber Rifles into a fine corps, ready to serve the Indian government wherever they might be required. He made the road safe, kept the Afridis friendly, and won the thanks of the people. At the end of his term of office he was given the rank of colonel and a pension in retirement, for his good work. When the Afridis began to cause anxiety in 1897, Colonel Warburton was asked by the government of India if he would assist in quieting the excitement amongst them. He declared himself ready to do so, but in the meantime the trouble had come to a head. Colonel Warburton took part in the campaign which followed; at its close his active career ended. He occupied his leisure in retirement by writing his memoirs, Eighteen Years in the Khyber (1900). He died at Kensington on the 22nd April 1899.

WILLIAM (1674–1709), English critic and divine, bishop of Gloucester, was born at Newark on the 24th of December 1668. His father belonged to an old Cheshire family and was town clerk of Newark. William was educated at Oakham and Newark grammar schools, and in 1714 he was articled to Mr. Kirke, attorney at East Markham, in Nottinghamshire. After serving his time he returned to Newark with the intention of practising as a solicitor; but, having given some time to the study of Latin and Greek, he left the law and was ordained deacon by the archbishop of York in 1723, and in 1727 received his other orders from the bishop of London. He had occupied the interval in various literary labours, the most important being the notes he contributed to Theobald's edition of Shakespeare, and an anonymous share in a pamphlet on the jurisdiction of the Court of Chancery, The Legal Judicature in Chancery stated (1727). This was an answer to another anonymous pamphlet, written by Philip Yorke, afterwards Lord Chancellor Hardwicke, who replied in an enlarged edition (1728) of his original Discourse of the Judicial Authority...of Master of the Rolls. Warburton now received from Sir Robert Sutton the small living of Greatley, in Nottinghamshire, exchanged next year for that of Brant Broughton, Lincolnshire. He held in addition, from 1725, the living of Frisby in Lincolnshire. In 1728 he was made an honorary M.A. of Cambridge. At Brant Broughton for eighteen years he spent his time in study, the first result of which was his treatise on the Alliance between Church and State (1736). The book brought Warburton into favour at court, and he probably only missed immediate preferment by the death of Queen Caroline. His next and best-known work, Divine Legation of Moses demonstrated on the Principles of a Religious Deist (2 vols., 1737–74), preserves his name as the author of the most daring and ingenious of theological paradoxes. The deists had made the absence of any inculcation of the doctrine of a future life an objection to the divine authority of the Mosaic writings. Warburton boldly admitted the fact and turned it against the adversary by maintaining that no merely human legislator would have omitted such a sanction of morality. The author's extraordinary power, learning and originality were acknowledged on all hands, though he excited censure and suspicion by his tenderness to the alleged heresies of Conyers Middleton. The book aroused much controversy. In a pamphlet of 1738, "Warburton the Deist," he replied to John Tindal, and answered his Reflections on Several Occasional Reflections (1744–1745) was an answer to Akinside, Conyers Middleton (who had up to this time been his friend), Richard Pococke, Nicholas Mann, Richard Grey, Henry Stebbing and other of his critics. As he characterized his opponents in general as the "pestilent herd of libertine scribblers with which the island is overrun," it is no matter of surprise that the book made him many bitter enemies.

Either in quest of paradox, or actually unable to recognize the real tendencies of Pope's Essay on Man, he entered upon its controversy against the Notes and Emendations on Shakespeare's series of articles (1738–1739) contributed to The Works of the Learned. Whether Pope had really understood the tendency of his own work has always been doubtful, but there is no question that he was glad of an apologist, and that Warburton's jeu d'esprit in the long run did more for his fortunes than all his erudition. It occasioned a sincere friendship between him and Pope, whom he persuaded to add a fourth book to the Dunciad, and encouraged to substitute Cibber for Theobald as the hero of the poem in the edition of 1743 published under the editorship of Warburton. Pope bequeathed him the copyright and the proceeds of his copperplate engravings upon his retirement by introducing him to Murray, afterwards Lord Mansfield, who obtained for him in 1746 the preachership of Lincoln's Inn, and to Ralph Allen, who, says Johnson, "gave him his niece and his estate, and, by consequence, a bishopric." The marriage took place in 1745, and from that time Warburton resided principally at his father-in-law's estate at Prior Park, in Gloucestershire, which he inherited on Allen's death in 1764. In 1747 appeared his edition of Shakespeare, into which, as he expressed it, Pope's earlier edition was melted down. He had previously entrusted notes and emendations on Shakespeare to Sir Thomas Hamner, whose unauthorized use of them led to a heated controversy. As early as 1727 Warburton had corresponded with Theobald on Shakespearean subjects. He now accused him of stealing his ideas and denied his critical ability. Theobald's superiority to Warburton as a Shakespearean critic has long since been acknowledged. Warburton was further kept busy by the attacks on his Divine Legation from all quarters, by a dispute with Bolingbroke respecting Pope's behaviour in the affair of Bolingbroke's Patriotic King, by his edition of Pope's Works, and by large contributions to the building of Lincoln's Inn, "to prove the truth of revealed religion...from the completion of the prophecies of the Old and New Testament which relate to the Christian Church, especially to the apostacy of Papal Rome." He died at Gloucester on the 7th of June 1779. Warburton was undoubtedly a great man, but his intellect, marred by wilfulness and the passion for
WARD, A. W.—WARD, E. S. P.

WARD, ADOLPHUS WILLIAM (1837— ), English historian and man of letters, was born at Hampstead, London, on the 2nd of December 1837, and was educated in Germany and at the university of Cambridge. In 1860 he was appointed professor of history and English literature in Owens College, Manchester, and was principal from 1890 to 1897, when he retired. He took an active part in the foundation of Victoria University, of which he was vice-chancellor from 1886 to 1890 and from 1894 to 1896. In 1897 the freedom of the city of Manchester was conferred upon him, and in 1900 he was elected master of Peterhouse, Cambridge. His most important work is his standard History of English Dramatic Literature to the Age of Queen Anne (1875), re-edited after a thorough revision in three volumes in 1890. He also wrote The House of Austria in the Thirty Years' War (1869), which was re-edited in 1890; Gipsies and their Way of Life (1869); The Electress Sophia and the Hanoverian Succession (1903); he edited Crabbe's Poems (2 vols., 1905-1906) and Pope's Poetical Works (1866); he wrote the volumes on Chaucer and Dickens in the "English Men of Letters" series, translated Curtius's History of Greece (5 vols., 1868-1873); he was one of the editors of the Cambridge Modern History, and with A. R. Waller edited the Cambridge History of English Literature (1907, 5 vols.). For the 9th edition of the Ency. Brit. he wrote the article Drama, and biographies of Ben Jonson and other dramatists; and he became an important contributor to the present work.

WARD, ARTEMUS (1834-1867), American humorist, was born in Waterford, Maine. He began life as a composer and became an occasional contributor to the daily and weekly journals. In 1858 he published in the Cleveland Plain Dealer the first of the "Artemus Ward" series, which attained great popularity both in America and England. His separate publications were: Artemus Ward: his Book (New York, 1862); Artemus Ward: his Travels (New York, 1863); Artemus Ward among the Pioneers (1863); Betsy Jane Ward: Her Book of Gags (New York, 1866), generally attributed to his widow; The Electress Sophia and the Hanoverian Succession (1893); and Other Papers (New York, 1867). Artemus Ward's Lecture at the Egyptian Hall . . . and Other Relics of the Humourist (London, 1869), edited by T. W. Robertson and J. C. Hotten, was published posthumously (New York, 1869). His wit largely relied on the drollery of strange spelling. In 1860 he became editor of Vanity Fair, a humorous New York weekly, which proved a failure. About the same time he began to appear as a lecturer, and his eccentric humour attracted large audiences. In 1866 he visited England, where he became exceedingly popular both as a lecturer and in literature. In the spring of the following year he gave up this occupation and devoted himself to the study of art.
WARD, J.—WARD, M. A.

(1829): A Dash to the Pole (1833); The White Crown, and Other Stories (1845); The Jorglar who moved Paradise (1897); and The Light of the World (1901).

WARD, JAMES (1829-1890), English animal painter and engraver, was born in Thames Street, London, on the 23rd of October 1769. At the age of twelve he was bound apprentice with J. Raphael Smith, but he received little attention and learnt nothing from this engraver. He was afterwards instructed for over seven years by his elder brother, William Ward, and he engraved many admirable plates, among which his "Mrs Billington," after Reynolds, occupies a very high place. He presented a complete set of his engravings, in their various states, amounting three hundred impressions, to the British Museum. While still a youth he made the acquaintance of George Morland, who afterwards married his sister; and the example of this artist's works induced him to attempt painting. His early productions were rustic subjects in the manner of Morland, which were frequently sold as the work of the more celebrated painter. His "Bull-Bait," an animated composition, introducing many figures, attracted much attention in the Royal Academy of 1797. A commission from Sir John Sinclair, president of the new Agricultural Society, to paint an Aldeurney cow and several similar works, and turned Ward's attention to animal-painting, a department in which he achieved his highest artistic successes. His "Landscape with Cattle," acquired for the National Gallery at a cost of £1,500, was painted in 1820-1822 at the suggestion of West, in emulation of the "Bull of Paul Potter" at the Hague. His "Boa Serpent Seizing a Horse" was executed in 1822, and his admirable "Grey Horse," shown in the Old Masters' Exhibition of 1839, dates from 1828. Ward also produced portraits, and many landscapes like the "Gordene Scar" and the "Harlech Castle" in the National Gallery. Sometimes he turned aside into the less fruitful paths of allegory, as in his unsuccessful "Pool of Bethesda" (1818), and "Triumph of the Duke of Wellington" (1818). He was a frequent contributor to the Royal Academy and the British Institution, and in 1841 he collected one hundred and forty examples of his art, and exhibited them in his house in Newman Street. He was elected an associate of the Royal Academy in 1807, and a full member in 1811, and died at Cheshunt on the 23rd of November 1839.

WARD compiled an autobiography, of which an abstract was published in the Art Journal in 1849.

WARD, JAMES (1829- ), English psychologist and metaphysicist, was born at Hull on the 27th of January 1843. He was educated at the Lilyfield Institute, at Berlin and Göttingen, and at Trinity College, Cambridge; he also worked in the physiological laboratory at Leipzig. He studied originally for the Congregational ministry, and for a year was minister of Emmanuel Church, Cambridge. Subsequently he devoted himself to psychological research, became fellow of his college in 1875 and university professor of mental philosophy in 1897. He was Gifford lecturer at Aberdeen in 1895-1897, and at St Andrews in 1898-1900. His work shows the influence of Leibnitz and Lotze, as well as of the biological theory of evolution. His psychology marks the definite break with the sensationalism of the English school; experience is interpreted as a continuum into which distinctions are gradually introduced by the action of selective attention; the implication of the subject in experience is emphasized; and the operation in development of subjective, as well as natural, selection is maintained. In his metaphysical work the analysis of scientific concepts leads to a criticism of naturalism, and to a view of reality as a unity which implies both subjective and objective factors. This view is further worked out, through criticism of pluralism and as a theistic interpretation of the world, in his St Andrews Gifford Lectures (The Realm of Ends). Beside the article "Psychology" in the Ency. Brit. (9th and 10th edit. 1885 and 1896), and A Dictionary of National Biography (1889, 3rd ed. 1909), besides numerous articles in the Journal of Physiology, Mind, and the British Journal of Psychology.

WARD, JOHN QUINCY ADAMS (1830-1910), American sculptor, was born in Urbana, Ohio, on the 20th of June 1830. His education was received in the village schools. He studied under Henry K. Brown, of New York, in 1852-1853, and by 1857, when he opened a studio in New York, he had executed busts of Joshua R. Giddings, Alexander H. Stephens, and Hannibal Hamlin, prepared the first sketch for the "Indian Hunter," and made studies among the Indians themselves for the work. In 1863 he became a member of the National Academy of Design (New York), and he was its president in 1872-1873. Among his best-known statues are the "Indian Hunter," finished in 1864 (Central Park, New York); Washington, heroic size (on the steps of the U.S. Sub-Treasury, Wall Street, New York); Henry Ward Beecher (Brooklyn); an equistrian statue of General Sherman. Thomas Jefferson, a statue of Israel Putnam (Hartford); and the seated statue of Horace Greeley, the founder of the New York Tribune, in front of the office of that newspaper. In 1896 he was elected president of the newly organized National Sculpture Society (New York). Unlike his fellow-countryman, W. W. Story, he acquired his training, his inspiration and his themes from his own country. He died in New York on the 1st of May 1910.

WARD, LESTER FRANK (1841- ), American geologist and sociologist, was born in Johnstown, Illinois, on the 18th of June 1841. He graduated at Columbia (now George Washington) University in 1863 and from the law school of the same university in 1871, his education having been delayed by his service in the Union army during the Civil War. In 1865-1872 he was employed in the United States Treasury Department, and became assistant geologist in 1881 and geologist in 1888 to the U.S. Geological Survey. In 1884-1886 he was professor of botany in Columbia University. He wrote much on paleobotany, including A Sketch of Paleobotany (1883), The Geographical Distribution of Fossil Plants (1888) and The Status of the Mesozoic Flora of the United States (1905). He is better known, however, for his work in sociology, in which, modifying Herbert Spencer and refuting the Spencerian individualism, he paralleled social with psychological and physical phenomena. His more important works are: Dynamic Sociology (1883, 2nd ed. 1897), Psychical Factors of Civilization (1897), Outlines of Sociology (1899), Sociology and Economics (1890), Pure Sociology (1903), and, with J. Q. Dealy, Text-Book of Sociology (1905).

See an appreciation by L. Gumpowicz, in Die Zeit (Vienna, 20th Aug. 1904); reprinted in English in vol. x. of The American Journal of Sociology.

WARD, MARY AUGUSTA [MRS HUMPHREY WARD] (1831- ), British novelist, was born on the 13th of June 1851 at Hobart, Tasmania, where her father, Thomas Arnold (1824-1900), was then an inspector of schools. Thomas Arnold was a son of Arnold of Rugby, and a brother of the poet Matthew Arnold. As a scholar of University College, Oxford, at the crisis of the Oxford Movement, he had begun life as a Liberal of the school of Jowett, Stanley and Clough. In 1856 he became a Roman Catholic, relinquished his inspectorship of schools in Tasmania, and was appointed professor of English literature at Dublin, whence followed Newman to Birmingham, where he published his Manual of English Literature. After a brief period of unrest he reverted to the English Church, and went to Oxford, where he lived twenty years, editing The Select Works of Wyclif and Beaufort for the Clarendon Press, Henry of Huntingdon and Symeon of Durham for the "Rolls" series, and, with W. E. Addis, the Catholic Dictionary. In 1877 he reverted once more to the Roman Catholic Church, and was appointed fellow of the new Royal University of Ireland, dying in Dublin on the 12th of November 1906. His daughter was brought up mainly at Oxford, and her early associations with a life of scholarship and religious conflict are deeply marked in her own later literary career. She was brought into close connexion during this period with Edward Hartopp Cradock, who was principal of Brasenose College from 1853 till his death in 1886, and some of whose characteristics went to the portrait of the "Squire" in Robert Eliotson. In 1872 she married Thomas Humphrey Ward (b. 1845), then fellow and tutor of Brasenose, and one of the authors of the Oxford Spectator. Mr Humphry Ward, a son of the...
WARD, S.—WARD, W. G.

Rev. Henry Ward, Vicar of St Barnabas, King's Square, London, E.C., remained at Oxford till 1886, and then went to London to take up literary work; with the help of the chief critics of the day he brought out the important selections of English verse called The English Poets (4 vols., 1850–1881). He joined the staff of The Times and wrote much for that paper, becoming its principal art critic. He also published Humphry Sandwich, a Memoir (1884); and he edited Men of the Reign (1885), English Art in the Public Galleries of London (1886), Men of the Time (1887), and, with the help of Matthew Arnold, Huxley, Lord Wolseley, H. S. Maine and others, The Reign of Queen Victoria: a Survey of Fifty Years Progress (1887).

Mrs Humphry Ward at first devoted herself to Spanish literature, and contributed articles on Spanish subjects to the Dictionary of Christian Biography, edited by Dr William Smith and Dr Henry Wace. She wrote also for Macmillan's Magazine. In 1881 she published her first book, Milly and Olly, a child's story illustrated by Lady (then Mrs) Alma-Tadema. This was followed in 1884 by a more ambitious, though slight, study of modern life, Miss Bretherton, the story of an actress. In 1885 Mrs Ward published an admirable translation of the Journal of the Swiss philanthropist, Edmund de Casterlé, and in 1890 her delicate appreciation of the subtleties of speculative thought. It was no bad preparation for her next book, which was to make her famous. In February 1888 appeared Robert Elsmere, a powerful novel, tracing the mental evolution of an English clergyman, of high character and conscience and of intellectual leanings, constrained to surrender his own orthodoxy to the influence of the "higher criticism." The character of Elsmere owed much to reminiscences both of T. H. Green, the philosopher, and of J. R. Green, the historian. Largely in consequence of a review by W. E. Gladstone in the Nineteenth Century (May 1888, "Robert Elsmere and the Battle of Belief"), the book became the talk of the civilized world. It ran in five months through seven editions in three-volume form, and the cheap American editions had an enormous sale. It was translated into several European languages, and was the subject of articles in learned foreign reviews. Robert Elsmere is in itself a fine story, notably in its picture of the emotional conflict between Elsmere and his wife, whose over-narrow orthodoxy brings her religious faith and their mutual love to a terrible impasse; but it was the detailed discussion of the "higher criticism" of the day, and its influence on Christian belief, rather than the power as a piece of dramatic fiction, that gave the book its exceptional vogue. It started, as no academic work could have done, a popular discussion on historic and essential Christianity. In 1890 Mrs Ward took a prominent part in founding University Hall, an "Elsmarian" settlement for working and teaching among the poor. Her next novel, David Grieve, was published in 1892. In Marcella (1894), and its sequel Sir George Tressey (1896), she broke new ground in the novel of modern politics and socialism, the fruit of observation and reflection at University Hall. In 1895 she had appeared the short tragic, the Story of Bessie Costrell. Mrs Ward's next long novel, Helbeck of Bannisdale (1898), treated of the clash between the ascetic ideal of Roman Catholicism and modern life. The element of Catholic and humanistic ideals entered also into Eleanor (1900), in which, however, the author relied less on the interest of a thesis and more on the ordinary arts of the novelist. Eleanor was dramatized and played at the Court Theatre in 1902. In Lady Rose's Daughter (1903)—dramatized as Agatha in 1905—and The Marriage of William Ashe (1905), modern tales founded on the stories respectively of Mlle de Lespinasse and Lady Caroline Lamb, she achieved entirely with success upon social portraiture. Later novels were Fenwick's Career (1906), Diana Mallory (1908), Daphne (1909) and Canadian Born (1910).

Mrs Ward's eminence among latter-day women-novelists arises from her high conception of the art of fiction and her strong grasp of intellectual and social problems, her descriptive power (fondly shown in the first part of Robert Elsmere) and her command of a broad and vigorous prose style. But her activities were not confined to literature. She was the originator in England of the Vacation Schools, which have done much to educate the poorest children of the community upon rational lines. She also took a leading part in the movement for opposing the grant of the parliamentary suffrage to women, whilst encouraging their active participation in the work of local government. She was one of the founders of the Women's National Anti-Suffrage League in 1908, and both spoke and wrote repeatedly in support of its tenets.

See for bibliography up to June 1904, English Illustrated Magazine, vol. 24, pp. 297–298 (H. C.)

WARD, SETH (1677–1695), English bishop, was born in Hertfordshire, and educated at Sidney Sussex College, Cambridge, where he became fellow in 1690. In 1693 he was chosen university mathematical lecturer, but he was deprived of his fellowship next year for opposing the Solemn League and Covenant. In 1694 he became Savilian professor of astronomy at Oxford, and gained a high repute by his theory of planetary motion, propounded in the works entitled In Ismaelis Bullialdi astronome phillolaiae fundamenta inquisito brevis (Oxford, 1693), and Astronomia geometrica (London, 1696). About this time he was involved in a controversy with Thomas Hobbes. He was one of the original members of the Royal Society. In 1659 he was appointed master of Trinity College, Oxford, but not having the statutory qualifications he resigned in 1660. Charles II. appointed him to the livings of St Lawrence Jewry in London, and Updown, Devonshire, in 1661. He also became dean of Exeter (1661) and rector of Brook, Cornwall (1662). In the latter year he was consecrated bishop of Exeter, and in 1667 he was translated to the see of Salisbury. The office of chancellor of the Order of the Garter was conferred on him in 1671. In his diocese he showed great severity to nonconformists, and rigidly enforced the act prohibiting conventicles. He spent a great deal of money on the restoration of the cathedrals of Worcester and Salisbury. He died at Knightsbridge on the 6th of January 1688/1689.

WARD, WILLIAM (1766–1826), English mezzotint-engraver, an elder brother of James Ward (q.v.), was born in London in 1766. He was the most distinguished pupil of J. Raphael Smith, and executed a great part of many of the plates which bear the name of that excellent engraver. In 1795 he began to exhibit in the Royal Academy, of which in 1814 he was elected an associate engraver, in 1817 the engraver, and in 1824 the president, in the latter capacity being appointed mezzotint-engraver to the prince regent and the duke of York. He executed six plates after Reynolds, engraved many of the works of his brother-in-law, George Morland, and his mezzotints after Andrew Geddes, which include the full-lengths of Sir David Wilkie and of Patrick Brydone, are of great merit. His engravings are full of artistic spirit, and show fine feeling for colour; and they are excellently tender and expressive in their rendering of flesh. He died in London on the 1st of December 1826.

WARD, WILLIAM GEORGE (1812–1882), English Roman Catholic theologian, was born on the 21st of March 1812. His career is extremely interesting as illustrating the development of religious opinion at a remarkable crisis in the history of English religious thought. Ward is described by his son and biographer as somewhat unequally gifted by nature. For pure mathematics he had a special gift—almost a passion. For history, applied mathematics—for anything, in fact, outside the exact sciences—he felt something approaching to contempt. He was endowed with a strong sense of humour and a love of paradox carried to an extreme. He went up to Christ Church, Oxford, in 1830, but his father's subsequent pecuniary embarrassments compelled him in 1833 to try for a scholarship at Lincoln College, which he succeeded in obtaining. His examination for mathematical honours exhibited some of the peculiarities of his character and mental powers. Four out of his five papers on applied mathematics were sent up absolutely blank. Honours, however, were not refused him, and in 1834 he obtained an open fellowship at Balliol. In the previous year the Tractarian movement had commenced, and Ward's relations with that movement were as original as the rest of his life. He was attracted to it by his.
WARD—WARDLAW, LADY

hatred of moderation and what he called “respectability” in any shape—a characteristic of which some amusing instances have been handed down. He was repelled from it by the conception he had formed of the character of Newman, whom he regarded as a mere antiquary. When, however, he was at length persuaded by a friend to go and hear Newman preach, he at once became a disciple. But he had, as Newman afterwards said of him, “struck into the movement at an angle.” He had no taste for historical investigations. He treated the question at issue as one of pure logic, and differing the Reformers, the right of private judgment which Protestants claimed, and the somewhat prosaic uniformity of the English Church, he flung himself into a general campaign against Protestantism in general and the Anglican form of it in particular. He nevertheless took deacon’s orders in 1838 and priest’s orders in 1840.

In 1839 Ward became the editor of the British Critic, the organ of the Tractarian party, and he excited suspicion among the adherents of the Tractarians themselves by his violent denunciations of the Church to which he still belonged. In 1841 he urged the publication of the celebrated “Tract XC,” and wrote in defence of it. From that period Ward and his associates worked undisguisely for union with the Church of Rome, and in 1844 he published his Ideal of a Christian Church, in which he openly contended that the only hope for the Church of St. Paul’s, was submission to the Church of Rome. This publication brought to a height the storm which had long been gathering. The university of Oxford was invited, on the 13th of February 1845, to condemn “Tract XC,” to censure the Ideal, and to degrade Ward from his degrees. The two latter propositions were carried and “Tract XC,” only escaped censure by the non placet of the proctors, Guilmard and Church. The condemnation precipitated an exodus to Rome. Ward left the Church of England in September 1845, and was followed by many others, including Newman himself. After his separation into the Church of Rome, Ward gave himself up to ethics, metaphysics and moral philosophy. He wrote articles, on free will, the philosophy of theism, on science, prayer, and miracles for the Dublin Review. He also dealt with the condemnation of Pope Honorious, carried on a controversial correspondence with John Stuart Mill, and took a leading part in the discussions of the Metaphysical Society, founded by Mr James Knowles, of which Tennyson, Huxley and Martineau were also prominent members. He was a vehement opponent of Liberal Catholicism. In 1851 he was made professor of moral philosophy at St Edmund’s College, Ware, and was advanced to the chair of dogmatic theology in 1852. In 1856 he became editor of the Dublin Review. He gave a vigorous support to the promulgation of the dogma of Papal Infallibility in 1870. After his admission into the Roman Catholic Church he had, rather to the dismay of his friends, entered the married state, and for a time had to struggle with poverty. But his circumstances afterwards improved. He died on the 6th of July 1882. (J. L.)*

See William George Ward and the Oxford Movement (1889); and William George Ward and the Catholic Revival (1893), by his son, Wilfrid Philip Ward (b. 1886), who has also written the Life and Times of Cardinal Wiseman; and Ten Personal Studies (1908).

WARD, that the guards or watches and that which is guarded or watched. The word is a double of “guard,” which was adapted from the French comparatively late into English. Both are to be referred to the Teutonic root wer-, to protect, defend, cf. “wary,” “warn,” “beware,” O. Eng. ward, Ger. warten, &c., and the English “guardian,” “garrison,” &c. The principal applications of the term are, in architecture, to the inner courts of a fortified place; at Windsor Castle they are called the upper and lower wards (see BAILEY, CASTLE); to a ridge of metal inside a lock blocking the passage of any key which has not a corresponding slot into which the ridge fits, to the slot in the key being also called “ward” (see LOCK). Another branch of meaning is to be found in the use of the word for a division into which a borough is divided for the purpose of election of councillors, or a parish for election of guardians. It was also the term used as equivalent to “hundred” in Northumberland and Cumberland. To this branch belongs the use for the various large or small separate rooms in a hospital, asylum, &c., where patients are received and treated. The most general meaning of the word is for a minor or person who is under a guardianship (see INFANT, MARRIAGE and ROMAN LAW).

WARDEN, a custodian, defender, guardian (see GUARDIAN, a word with which it is etymologically identical). The word is frequently employed in the ordinary sense of a watchman or guardian, but more usually in England in the sense of a chief or head official. The lords wardens of the marches, for example, were powerful nobles appointed to guard the borders of Scotland and of Wales; they held their lands per baroniam, the king’s writ noted against them, and they had extensive rights of administering justice. The chief officer of the ancient stannaries of Cornwall has the title of lord warden (see STANNARIES), as has also the governor of Dover Castle (see Cinque Ports). Warden was until 1870 the alternative title of the master of the mint, and “warden of the standards” the title of the head of the Standards office (see STANDARDS). The principal or head of several of the colleges of Oxford University is also termed WARDEN.

WARDHA, a town and district of British India, in the Nagpur division of the Central Provinces, which take their name from the Wardha river. The town is situated 49 m. S.W. of Nagpur by rail. Pop. (1901) 9872. It was laid out in 1866, shortly after the district was first constituted. It is an important centre of the cotton trade.

The District of Wardha has an area of 4228 sq. m. It is hilly in the north, and intersected by spurs from the Satpura range. The central portion includes the three peaks of Malegun (1726 ft.), Nandgaon (1854 ft.), and Jahigarah (2086 ft.). From this cluster of hills numerous small streams lead to the Wardha river on the one side, while on the other the Dham, Bor, and Asoda flow down the length of the district in a south-easterly direction. The Wardha, and its affluent the Wana, are the only rivers of any importance. To the south the country spreads out in an undulating plain, intersected by watercourses, and broken here and there by isolated hills rising abruptly from the surface. In general the lowlands are well wooded. Leopards, hyenas, wolves, jackals and wild hogs abound in the district; other animals found are the spotted deer, nilgai and antelope. The district is subject to great variations of climate, and the rainfall at Wardha town averages 41 in. In 1901 the population was 385,103, showing a decrease of 4% in the decade. The principal crops are cotton, millet, wheat and oil-seeds. This region supplies the cotton known in the market as Hinganath. There are cotton-mills at Hinganath and Palgaon, and many factories for ginning and pressing cotton. The district is traversed by the Nagpur line of the Great Indian Peninsula railway. A branch runs from Wardha town past Hinganath to the Warora coal-field in the district of Chanda. The history of Wardha forms part of that of Nagpur district, from which it was separated in 1862 for administrative purposes.

See Wardha District Gazetteer (Alibabad, 1906).

WARDLAW, ELIZABETH, LADY (1677–1747), reputed author of Hardyknute, second daughter of Sir Charles Halket, was born in April 1677. She married in 1666 Sir Henry Wardlaw, Bart., of Pitreavie. The ballad of Hardyknute, published in 1719 as an old poem, was supposed to have been discovered by her in a vault at Dunfermline, but no MS. was ever produced; and in the 1767 edition of Percy’s Reliques the poem was ascribed to her. The beautiful ballad of Sir Patrick Spens (F. J. Child, English and Scottish Popular Ballads, ii. 17) has been also asserted to be her work, one of the supporters of the theory being Robert Chambers (Remarks on Scottish Ballads, 1859). The level of accomplishment in Hardyknute, however, gives no reason for supposing that Lady Wardlaw was capable of producing the charm of Sir Patrick Spens.

WARDLAW, H.—WAREHAM

WARDLAW, HENRY (d. 1440), Scottish prelate, was a son of Sir Andrew Wardlaw and a nephew of Walter Wardlaw (d. 1390), bishop of Glasgow, who is said to have been made a cardinal by the anti-pope Clement VII. in 1381. Educated at the universities of Oxford and of Paris, Henry Wardlaw returned to Scotland about 1385, and owing to his influential connections received many benefices in the Church. He passed some time at Avignon, and it was whilst he was residing at the papal court that he was chosen bishop of St Andrews, being consecrated in 1403. Returning to Scotland he acted as tutor to the future king, James L, and finished the work of restoring his cathedral. Then having helped to bring about the release of James from his captivity in England, he crowned this king in May 1424, and afterwards acted as one of his principal advisers. He appears to have been an excellent bishop, although he tried to suppress the teaching of John Wycliffe by burning its advocates. He died on the 6th of April 1440. Wardlaw's chief title to fame is the fact that he was the founder of the university of St Andrews, the first Scottish university. He issued the charter of foundation in February 1411, and the privileges of the new seat of learning were confirmed by a bull of Pope Benedict XIII., dated the 28th of August 1413. The university was to be "an impregnable rampart of doctors and masters to resist heresy."

WARDROBE, a portable upright cupboard for storing clothes. The earliest wardrobe was a chest, and it was not until some degree of luxury was attained in regal palaces and the castles of powerful nobles that separate accommodation was provided for the sumptuous apparel of the great. The name of wardrobe was then given to a room in which the wall-space was filled with cupboards and lockers—the drawer is a comparatively modern invention. From these cupboards and lockers the modern wardrobe, with its hanging spaces, sliding shelves and drawers, was slowly evolved. In its movable form as an oak "hanging cupboard" it dates back to the early 17th century. For probably a hundred years such pieces, massive and cumbersome in form, but often with well-carved fronts, were made in fair numbers; then the gradual diminution in the use of oak for cabinet-making produced a change of fashion. Walnut succeeded oak as the favourite material for furniture, but some strong oaks, such as the Kentish nave (q.v.) at Stowe, and others, were made. Walnut appeared to have been made very rarely, although clothes presses, with drawers and sliding trays, were frequent. During a large portion of the 18th century the tallboy (q.v.) was much used for storing clothes. Towards its end, however, the wardrobe began to develop into its modern form, with a hanging cupboard at each side, a press in the upper part of the central portion and drawers below. As a rule it was of mahogany, but so soon as satinated and other hitherto scarce finely grained foreign woods began to be obtainable in considerable quantities, many elaborately and even magnificently inlaid wardrobes were made. Where Chippendale and his school had carved, Sheraton and Hepplewhite and their contemporaries obtained their effects by the artistic employment of deftly contrasted and highly polished woods. The first step in the evolution of the wardrobe was taken when the central doors, which had hitherto enclosed merely the upper part, were carried to the floor, covering the drawers as well as the sliding shelves, and were fitted with mirrors.

WARD-ROOM (i.e. the room of the guard), the cabin occupied by the commissioned officers, except the captain, in a man-of-war. In the wooden line-of-battle ships it was above the gun- room.

WARE, a market town in the Hertford parliamentary division of Hertfordshire, England, on the river Lea, 22 m. N. of London by a branch of the Great Eastern railway. Pop. of urban district (1901) 5573. The church of St Mary is a cruciform Decorated and Perpendicular building of flint and stone, consisting of chancel (built, it is supposed, by Lady Margaret Beaufort, countess of Richmond, and mother of Henry VII.), lady chapel to the south (c. 1380), nave of five bays of the time of Richard II., transepts, aisles, south porch and embattled tower of the time of Edward III. There is an elaborate Perpendicular font. The modern mansion of The Priory, to the west of the town, occupies the site of a priory of the order of St Francis, founded, according to Dugdale, by Hugh de Grantmaisill, lord of Ware. A portion of the original building is incorporated in the modern one. Among public buildings are the corn exchange and the town-hall, which includes a literary institute and library. The famous "Great Bed of Ware," referred to in Shakespeare's "Twelfth Night," which formerly was at the Saracen's Head in Ware, has been moved to Rye House, about 2 m. distant, the scene of the Rye House plot of 1683 against Charles II. The town possesses breweries and brick-fields, and there is a large trade in malt, assisted by the navigation of the Lea to London. Near the village of Great Amwell (1 m. S.E.) are the sources of the New River, formed in 1666-1672 to supply London with water; and on a small island in the stream stands a monument to Sir Hugh Myddleton, through whose exertions this work was carried out.

WARE, a township of Hampshire county, Massachusetts, U.S.A., traversed by the Ware river, and about 25 m. E.N.E. of Springfield. Pop. (1880) 487, (1890) 7559, (1900) 8263, of whom 7563 were foreign-born, (1910 census) 8774. Area 29-3 sq. m. The township is served by the Boston & Albany and Boston & N'Alaine railways, and by two interurban electric lines. Its average elevation is about 550 ft. above sea-level. There is a public library (14,225 volumes in 1910). In 1905 the value of the factory products was $3,783,606, 23.2% more than in 1900. Among the manufactures are cotton and woollen goods, and boots and shoes. The township owns and operates its waterworks. Because of its hard and rough soil, Ware was not easily settled. In 1703 the Ware townspeople formed a company for the "acquisition of the lands and waste in the town of Ware or any town thereabouts," and obtained a deed of land in 1705. Later a town charter was obtained, and Ware was incorporated as a town in 1772.

WAREHAM, a market town and municipal borough in the eastern parliamentary division of Dorsetshire, England, 12 1/4 m. S.W. by W. from London by the London & South-Western railway. Pop. (1901) 2083. It lies between the rivers Frome and Piddle, 13 m. above their outflow into Poole harbour. The town is of high antiquity, and is partially surrounded by the old works probably of British construction. The church of St Mary contains a chapel dedicated to St Edward, commemorating that Edward who was murdered at Corfe Castle in this neighbourhood, whose body lay here before its removal to Shaftesbury. It also possesses a remarkable Norman font of lead. Two other ancient churches remain, but are not used for worship. There are ruins of a priory dedicated to SS. Mary, Peter and Ethelwold, and the site of the old castle may be traced. The town and neighbourhood have been long noted for their lime and cement, and large quantities of potters' pipe, fire and other kinds of clay are sent to Staffordshire and to foreign countries. The borough is under a mayor, 4 aldermen, and 12 councillors. Area 253 acres.

Owing to its situation as a key of Purbeck, the site of Wareham (Wareham, Warham) has been occupied from early times. The earthworks, of British origin, were modified in almost every successive age. That Wareham was a pre-Saxon town is evident from Asser's statement that its British name was Duungecir. The early chroniclers declare that St Aldhelm founded a church near Wareham about 701, and perhaps the priory, which is noted as existing in 1054, when the Danes returned from Cambridge to a strong position in this fort. Their occupation was not lengthy. Having made terms with Alfred, they broke the conditions and returned to Cambridge. In the following year they were again at Wareham, which they made their headquarters. Peorhtic, the immediate predecessor of Egbert, was buried here. Further incursions made by the Danes in 998 and in 1015 under Canute probably resulted in the destruction of the priory, on the site of which a later house was founded in the 12th century as a cell of the Norman abbey of Lyca, and in the decayed condition of Wareham in 1586, when 203 houses
WARENNE, EARLS—WAR GAME

were ruined or waste, the result of misfortunes, poverty and fire. The early castle, which existed before 1086, was important during the civil wars of Stephen's reign; in 1142 Robert, earl of Gloucester, on his departure for France, committed it to his son's charge. Stephen, however, surprised and took it, but it surrendered to the earl in the same year on the king's refusal to send it aid. John fortified it against Louis of France in 1216, and during the civil wars it was the scene of much fighting, being stormed by the parliamentary forces in 1644. Warenne was taken in 1649 by Lord Byron, and the Warringtons in 1776 paid 20 marks for a default. In 1180-1181 they rendered account of 5 marks for erecting a geld without licence. The fee-farm of the borough was obtained in 1211, on a fine of 100 marks. The constitution of Waremham underwent a change during the years 1326-1338, when the governing body of the bailiffs and commonalty were replaced by the mayor and bailiffs. In 1587 Elizabeth granted certain privileges to Waremham, but it was not incorporated until 1703, when the existing fairs for April 6 and August 23 were granted. The port was important throughout the middle ages, and was required to furnish ships for the French war in 1334. Considerable trade was carried on with France and Spain, cloth, Purbeck stone and, later, clay being largely exported.

WARENNE, EARLS. The Warennes derived their surname from the river of Guernsey or Warenne and the little town of the same name near Arques in Normandy. William de Warenne, who crossed with William I. in 1066, was a distant cousin of the Conqueror, his grandmother having been the sister of Gunora, wife of Richard I. of Normandy: De Warenne received as his share of English spoil some 300 manors in Yorkshire, Norfolk, Surrey and Sussex, including Lewes Castle. He was wounded at the siege of Pevensey and died in 1069, a year after he had received the title of earl of Surrey. Both he and his successors were more commonly styled Earl Warenne than earl of Surrey. His wife Gundrada, described on her monument as stirps ducum, appears to have been a sister of Gharbod, earl of Chester.

Their son William, 2nd earl (c. 1091-1138), was a suitor for the hand of Matilda of Scotland, afterwards queen of Henry I. He was temporarily deprived of his earldom in 1101 for his support of Robert, duke of Normandy, but he commanded at the Battle of Trenchenberi (1106), and was governor of Rouen in 1135. He carried off Elizabeth of Vermandois, granddaughter of Henry I. of France, and wife of Robert, count of Meulan, and married her in 1118 after her husband's death.

William de Warenne, 3rd earl (d. 1148), was, with his half-brother, Robert de Beaumont, early of Leicester, present at the battle of Lincoln, where his flight early in the day contributed to Stephen's defeat. He remained faithful to the queen during Stephen's imprisonment, and in 1146 he took the cross, and was killed near Laodoicea in January 1148.

His daughter and heiress, Isabel, married in 1153 William de Blois, second son of King Stephen and Matilda of Boulogne, and in 1163 Hamelin Planntagente, natural son of Geoffrey, count of Anjou. Both Isabel's husbands appear to have borne the title of Earl Warenne. Earl Hamelin was one of those who at the council of Northampton denounced Becket as a traitor; he remained faithful to his half-brother, Henry II., during the trouble with the king's sons, and in Richard I.'s absence on the crusade he supported the government against the intrigues of Prince John.

William de Warenne (d. 1240), son of Isabel and Hamelin, who succeeded to the earldom in 1216, enjoyed the special confidence of King John. In 1212, when a general rebellion was apprehended, John committed him the custody of the northern shires; and he remained faithful to his master throughout the troubles which preceded the signing of the Charter. In 1216, as the king's situation became desperate, the earl repented of his loyalty, and, shortly before the death of John, made terms with Prince Louis. He returned, however, to his lawful allegiance immediately upon the accession of Henry III., and was, during his minority, a loyal supporter of the crown. He disliked, however,

the royal favourites who came into power after 1227, and used his influence to protect Hubert de Burgh when the latter had been removed from office by their efforts (1232). Warenne's relations with the king became strained in course of time. In 1238 he was evidently regarded as a leader of the baronial opposition, for the great council appointed him as one of the treasurers who were to prevent the king from squandering the subsidy voted in that year. His son John de Warenne (c. 1231-1304) succeeded 1240, and at a later date bore the style of earl of Surrey and Sussex. In the battle of Lewes (1264) he fought under Prince Edward, and on the defeat of the royal army fled with the queen to France. His estates were confiscated but were subsequently restored. He served in Edward I.'s Welsh campaigns, and took a still more prominent part in Scottish affairs, being the king's lieutenant in Scotland in 1296-1297. In September 1297 he advanced to Stirling, and, giving way to the clamour of his soldiers, was defeated by William Wallace on the 11th. He invaded Scotland early the next year with a fresh army, and, joining Edward in the second expedition of that year, commanded the rear at Falkirk. He was killed in the battle.

By his first wife, Alice of Lusignan, half-sister of Henry III., Earl Warenne had three children—Alice, who married Henry Percy, father of the 1st baron Percy; Isabella, who married John Baliol, afterwards king of Scots; and William, who pre-deceased his father, leaving a son John.

John de Warenne (1286-1347) succeeded his grandfather in 1304, and was knighted along with the prince of Wales in 1306, two days after his marriage with the prince's niece, Joanna, daughter of Eleanor of England, countess of Bar. From that time Joanna was his constant companion. He was not engaged in the Scottish war, in which he had a personal interest, since John Baliol was his cousin and at one time his ward. As there were no children of his marriage, his nephew, Richard Fitzalan II., earl of Arundel (c. 1307-1376), became heir to his estates and the earldom of Surrey. His northern estates reverted to the crown, and the southern estates held by Joanna of Bar during her lifetime passed to Fitzalan. The Warrens of Poynton, barons of Stockport, descended from one of Earl Warenne's illegitimate sons by Isabella de Holland. Earl Warenne had received from Edward Baliol the Scottish earldom of Strathbarn, but seems never to have established an effective possession.

WAR GAME, or (in its German form) KRIEGSPIEL, a scientific game, played by representing the positions and movements of troops on a map. Kriegspiel is, as the name indicates, of German origin. A form of it, invented by Marshal Keith, called Kriegs-schachspiel (War Chess), was in vogue in the 19th century. In its present form it was invented by von Reisswitz (1794-1827), a Prussian officer, in 1824. As a game it quickly became fashionable at the German courts, and as a means of instruction it was promptly introduced into the Prussian army, whence it has spread to all the armies of the world. The idea of it has been applied also to naval warfare in recent times, the most usual form of naval war game being that designed by F. T. Jane about 1898.

In the military game the positions of troops are marked on maps, movements are made under regulations and the whole or portions of past campaigns can be reproduced in outline of fair accuracy, or more usually hypothetical manoeuvres may be formulated for study and instruction. The materials required are at least three copies of the same map, drawn to such scale as may be suitable to the magnitude of the operations to be represented. If the scheme is one for small numbers of troops, maps of large scale are essential, as small features of the ground largely influence the action of small bodies, and it is only on large-scale maps that the real influence of small features can readily be appreciated. Conversely, with large bodies, maps on a diminished scale are convenient. A great amount of detail is necessary in all maps drawn for military purposes; heights, roads, buildings, water-courses, fences and the nature of the

WARGLA—WARHAM

325
ground, all enter into the question of the feasibility or the reverse of military operations; and where the map is the actual field of manoeuvre, the features of the natural field must be adequately supplied. Blocks, cut or moulded to scale, represent the different units of the combatants; and are coloured (generally red and blue) to distinguish the opposing forces. Some pairs of dividers and a few measures of the same scale as the maps employed complete the material. Southburgh’s maps for submission for manoeuvre were on smaller scale; and although rules have been drafted at various times and in many languages, they have generally been allowed to lapse, practice having proved that the decision of a competent umpire is of more value, as to the soundness or unsoundness of a military manoeuvre, than a code of regulations which inevitably lack elasticity.

The usual course of procedure varies but little in the different countries in which the system has been employed. The central map screened from the view of the combatants is used by the umpire, who places on it the forces of both sides; copies are on either hand behind screens or in adjoining rooms, and on them representative blocks are placed in position. Each umpire is supplied by information possessed by each respective commander. A scheme is formulated such as may occur in war, and a “General Idea” or “Narrative” is the common property of both sides. This contains the broad lines of the preliminary moves in the game, and is on the proposed movement of either commander in the field. The General Idea is supplemented by “special ideas,” issued one to each of the combatants, supplying the information which a commander may require only in the event of the occupation of his own field. A third series of instructions is issued, entitled “Orders,” which define to each commander the object to be attained; and on receipt of these he is required to draw up specific orders, such as, in manoeuvre or in war, would be considered necessary for issue to field units in the assumed circumstances. Then the game begins. The units of artillery, cavalry, infantry or train-wagons advance or retreat at a rate approximately regulated to their normal pace. Information gained by advancing patrols is brought at realistic speed to its destination; and no alteration in the ordered movements of a unit is allowed, till expiration of the time fixed for the execution of the move, or for the issue of fresh orders. So the exercise progresses, each movement is marked, and periodically the blocks on the three maps are placed as they would be at a simultaneous moment. Smaller units yield to larger ones of the enemy; equal forces, as such, are balanced by superiority of position; “contain” one another, and are practically neutralised till reinforcements arrive and equilibrium is overthrown.

The decisions of the umpire are all-important, and it is he who makes or mars the value of the instruction. Some customs must be universally accepted for the guidance both of himself and of the players. A force arrayed within effective range on the flank of an equal force is better than one which is in position with an impeded glisca is a terrible task for a frontal attack. Cavalry, as such, is ineffective in woodlands, marshes or a country broken up by cross hedges or wire fencing. Infantry in manoeuvre can do much more effective work, and bodies affords opportunities for attack by well-handled cavalry. The just application of the ideas contained in these few sentences to the varying stages of a combat is no mean task for a cultured soldier.

One of many difficulties encountered in war is the lack of accurate information. Any man’s view of details spread over large areas of country is extremely limited, even with the greatest precautions against unreality, a commander’s information is vastly more accurate over the extended units of his mimetic force at kriegspiel than when the forces so represented are men, horses and machines, wrapped in dust or in smoke, and partially obscured by accidents of the ground too insignificant for reproduction on the map. Yet whilst accepting a certain unreality in kriegspiel, and to a less degree in field manoeuvres, both by one and the other military training and education, the player must not forget that the effective capabilities of bodies affords opportunities for attack by well-handled cavalry. The just application of the ideas contained in these few sentences to the varying stages of a combat is no mean task for a cultured soldier.

WARGLA, a town in the Algerian Sahara, 175 m. S.W. of Biskra on the caravan route to the Niger countries, and a starting-point for the exploration of the southern part of the Sahara. Pop. (1906) 3,579, the majority of mixed Berber and negro blood. The town is walled and is entered by six gateways, which are fortified. The French fort, barracks, hospital and other buildings are south of the native town. Wargla lies in an oasis containing many palm trees. It claims to be the oldest town in the Sahara, and was for a long time self-governing, but eventually placed under the protection of the sultan of Morocco. The sultan, however, had ceased to have any power in the town some time previous to the French occupation. Wargla was first occupied for the French in 1853 by native allies, but it was not until 1872 that the authority of France was definitely established. The importance of the town as a trans-Saharan trade centre has greatly declined since the suppression of slave-trading by the French. The oasis in which Wargla is situated contains two or three other small fortified ksars or villages, the largest and most picturesque being Ruissat. The total population of the oasis is about 12,000.

WARHAM, William (c. 1450–1532), archbishop of Canterbury, belonged to a Hampshire family, and was educated at Winchester and New College, Oxford, afterwards practising and teaching law both in London and Oxford. Later he took holy orders, held two livings, and became master of the rolls in 1504, while Henry VII. found him a useful and clever diplomatist. He helped to arrange the marriage between Henry’s son, Arthur, and Catherine of Aragon; he went to Scotland with Richard Foxe, then bishop of Durham, in 1497; and he was partly responsible for several commercial and other treaties between Flanders, Burgundy and the German king, Maximilian I. In 1502 Warham was consecrated bishop of London and became keeper of the great seal, but his tenure of both these offices was short, as in 1504 he became lord chancellor and archbishop of Canterbury. In 1509 the archbishop married and then crowned Henry VIII. and Catherine of Aragon, but gradually withdrawing into the background he resigned the office of lord chancellor in 1515, and was succeeded by Wolsey, whom he had consecrated as bishop of Lincoln in the previous year. This resignation was possibly due to his dislike of Henry’s foreign policy. He was present at the Field of the Cloth of Gold in 1520, and assisted Wolsey as assessor during the secret inquiry into the validity of Henry’s marriage with Catherine in 1527. Throughout the divorce proceedings Warham’s position was essentially that of an old and weary man. He was named as one of the counsellors to assist the queen, but, fearing to incur the king’s displeasure and using his favourite phrase “praecum non esse,” he gave her very little help; and he signed the letter to Clement VII. which urged the pope to assent to Henry’s wish. Afterwards it was proved that for the above reasons he should try the case, but his suggestion came to nothing. He presided over the Convocation of 1531 when the clergy of the province of Canterbury voted £100,000 to the king in order to avoid the penalties of praemunire, and accepted Henry as supreme head of the church with the saving clause “so far as the law of Christ allows.” In his concluding years, however, the archbishop showed rather more independence. In February 1532 he protested against all acts concerning the church passed by the parliament which met in 1529, but this did not prevent the important proceedings which occupied the convocation through the following year, and their finalisation in the same year. Against this further compliance with Henry’s wishes Warham drew up a protest; he likened the action of Henry VIII. to that of Henry II., and urged Magna Carta in defence of the liberties of the church. He died on the 22nd of August 1532 and was buried in Canterbury cathedral. Warham, who was chancellor of Oxford University from 1506 until his death, was munificent in his public, and moderate in his private life. As archbishop he seems to have been somewhat arbitrary, and his action led to a serious quarrel with Bishop Foxe of Winchester and others in 1512.

WARKWORTH, a small town in the Wansbeck parliamentary division of Northumberland, England, 32 m. N. of Newcastle-upon-Tyne by the North-Eastern railway. Pop. (1901) 712. It is beautifully situated in a hollow of the river Coquet, 13 m. above its mouth, where, on the S. bank is Amble, an urban district (pop. 4428), with a harbour. An ancient bridge of two arches crosses the river, with a fortified gateway on the road mounting to the castle, the site of which is surrounded on three sides by the river. Of this Norman stronghold there are fine remains, including walls, a gateway and hall; while the remainder, including the Lion tower and the keep, is of the 13th and 14th centuries. Roger Fitz-Richard held the manor and probably built the earliest parts of the castle in the reign of Henry II. The lordship came to the Percies in Edward III.'s reign and is still held by their descendants the dukes of Northumberland, though it passed from them temporarily after the capture of the castle by Henry IV. in 1405, and again on the fall of the house of Lancaster. The foundation of Warkworth church is attributed to CSLovul, king of Northumbria (c. 736), who subsequently became a monk. It was the scene of a massacre by a Scottish force sent by William the Lion in 1174. The church is principally of Norman and Perpendicular work, but remains of the Saxon building have been discovered. In the vicinity are remains of a Benedictine priory of the 11th century. By the side of the Coquet above the castle is the Hermitage of Warkworth. This remarkable relic consists of an outer portion built of stone, and an inner portion hewn from the steep rock above the arch. This part contains a storeroom and a smaller chamber, both having altars. There is an altar-tomb with a female effigy in the chapel. From the window between the inner chamber and the chapel, and from other details, the date of the work may be placed in the latter part of the 11th century, the characteristics being late Decorated. The traditional story of the origin of the hermitage, attributing it to one of the Bertrams of Bothal Castle in this county, is told in Bishop Percy's ballad The Heroine of Warkworth (1771). At Amble are ruins of a monastic toll-house, where a tax was levied on shipping; and Coquet Island, 1 m. off the mouth of the river, was a monastic retreat from the earliest times, like the Farne and Holy Islands farther north. The harbour at Amble has an export trade in coal and bricks, coal and fireclay being extensively worked in the neighbourhood, and an import trade in timber.

WARLOCK, a wizard, sorcerer or magician (see MAGIC). The word in O. Eng. is werloga, literally "a liar against the truth," from wer, truth, cognate with Lat. verum (cf. Ger. wahr), and loga, liar, from fegan, to lie (cf. Ger. lügen). It was thus used with the meaning of a traitor, deceiver, a breaker of a truce. In M. Eng. it is found as a name for the devil (werlog, the arch liar and deceiver. The use of the word as a noun for a sorcerer or wizard, one whose magic powers are gained by his league with the devil, seems to be a northern English or Scottish use.

WARMINGTON, a market town in the Westbury parliamentary division of Wilts, England, 1001 m. W. by S. of London by the Great Western railway. Pop. of urban district (1901) 5547. Its white stone houses form a long curve between the uplands of Salisbury Plain, which sweep away towards the north and east, and the tract of park and meadow land lying south and west. The cruciform church of St. Denys has a 14th-century south porch and tower. St. Lawrence's chapel, a chantry built under Edward I., was bought by the townfolk at the Revolution. Warmington has also a free school established in 1707, a missionary college, a training home for lady missionaries and a reformatory for boys. Besides a silk mill, malthouses and engineering and agricultural implement works, there is a brisk trade in farm produce.

Warmington appears in Domesday, and was a royal manor whose tenant was bound to provide, when required, a night's lodging for the king and his retinue. This privilege was enforced by George III. and he visited Longleat. The meeting of roads from Bath, Frome, Shaftesbury and Salisbury was a busy coaching centre. Eastward, within 2 m., there are two great British camps: Battlesbury, almost impregnable save on the north, where its entrenchments are double; and Scratchbury, a line of outworks encircling an area of some 40 acres, with three entrances and a citadel in the midst. Barrows are numerous. Longleat, a seat of the marquesses of Bath, lies 5 m. S.E., surrounded by its deer park, crossed from N. to S. by a long and narrow mere. The house is one of the largest and most beautiful examples in the county, dating from the close of the 15th century. Its name is derived from the "least" or command which conveyed water from Horningsham, about 1 m. south, to supply the mill and Austin priory founded here late in the 13th century. The monastic estates passed at the Dissolution to the Thynne family, who built Longleat. Sir Christopher Wren added certain staircases and a doorway. In 1670 the owner was the celebrated Thomas Thynne satirized in Dryden's Absalom and Achitophel, and Bishop Ken found a home at Longleat for twenty years after the loss of his bishopric.

WARNER, CHARLES DUDLEY (1829-1900), American essayist and novelist, was born of Puritan ancestry, in Plainfield, Massachusetts, on the 25th of September 1829. From his birth to his fourteenth year he lived in Charlemont, Mass., the scene of the experiences pictured in his delightful study of childhood, Being a Boy (1877). He removed thence to Cazenovia, New York, and in 1851 graduated from Hamilton College, Clinton, N.Y. He worked with a surveying party in Missouri; studied law at the university of Pennsylvania; practised in Chicago (1850-1860); was assistant editor (1860) and editor (1861-1867) of The Hartford Press, and after The Press was merged with the Connecticut, on whose staff he was editor in chief, he contributed to the Southern Pacific, and in 1884 he joined the editorial staff of Harper's Magazine, for which he conducted The Editor's Drawer until 1892, when he took charge of "The Editor's Study." He died in Hartford on the 20th of October 1900. He travelled widely, lectured frequently, and was actively interested in prison reform, city park supervision and other movements for the public good. He was the first president of the National Institute of Arts and Letters, and, at the time of his death, was president of the American Social Science Association. He first attracted attention by the reflective sketches entitled My Summer in a Garden (1857); first published in The Hartford Courant, popular for their abounding and refined humour and mellow personal charm, their wholesome love of outdoor things, their suggestive comment on life and affairs, and their delicately finished style, qualities that suggest the work of Washington Irving. Among his other works are Suauterings (descriptions of travel in eastern Europe, 1872) and Back-Log Studies (1872); Baddeley, and That Sort of Thing (1874), travels in Nova Scotia and elsewhere; My Winter on the Nile (1876); In the Levant (1876); In the Wilderness (1878); A Roundabout Journey, in Europe (1888); On Horsback, in 1878; he removed to New York, where, however, he was ill of little success; he then went to his father's farm in Vermont, and worked for manufacturers of silver and plated ware as well
as makers of mantel ornaments. He attracted the attention of Daniel Cottier, of the Cottier Art Galleries of New York, where Warner's work was exhibited, and some commissions gradually secured for him recognition. They were followed by busts of Alden Weir, the artist, and of Maud Morgan, the musician; some decorations for the Long Island Historical Society; statues of Governor Buckingham at the State Capitol, Hartford, Conn.; William Lloyd Garrison, Benjamin Franklin, General Charles Gates, and more, all done in the reliefs of several striking North American Indian types; a fountain for Portland, Oregon, and the designs for the bronze doors, "Tradition" and "Writing," of the Congressional Library at Washington, of which he lived to complete only the former, which contains the beautiful figures of "Imagination" and "Memory." Warner died in New York City on the 14th of August 1896. He was one of the five charter members of the Society of American Artists (1877), and in 1889 became an academician, National Academy of Design, New York. One of his best-known works is a "Diana." He designed the souvenier silver half-dollar piece for the Columbia Fair at Chicago, in 1893, making also some colossal heads of great artists for the art palace, and busts of Governors Clinton and Flower, of New York State.

WARNER, SETH (1733-1784), American Revolutionary soldier, was born in Roxbury, Connecticut, on the 17th of May 1743. He removed with his father to the "New Hampshire Grants." In 1763, and became prominent among the young men who forcibly resisted New York's claim to the territory (see Vermont). At the outbreak of the War of Independence, he led the rangers of "Green Mountain Boys," which captured Crown Point (q.v.) on the 11th of May, 1775, and took part in the unsuccessful expedition against Quebec later in the year. In July 1776 he became colonel in the Continental Army, and served throughout the war. He retired in 1782, and returned to Roxbury, where he died in 1784.

See Daniel Chipman. Life (Burlington, Vt., 1858).

WARNER, WILLIAM (1538-1609), English poet, was born in London about 1538. He was educated at Magdalen Hall, Oxford, but left the university without taking a degree. He practised in London as an attorney, and gained a great reputation among his contemporaries as a poet. His chief work is a long poem in fourteen-syllabled verse, entitled Albion's England (1586), and dedicated to Henry Carey, 1st Baron Hunsdon. His history of his country begins with Noah, and is brought down to Warner's own time. The chronicle is by no means continuous, and is varied by fictitious episodes, the best known of which is the idyll in the fourth book of the loves of Argentille, the daughter of the king of Deira, and the Danish prince, Curan. Here Warner's simple art shows itself at its best. His book, perhaps on account of its patriotic subject, was very popular, but it is an indispensable and how Francis Meres came to rank him with Spenser as the chief heroic poets of the day, and to institute a comparison between him and Euripides. Warner died suddenly at Amwell in Hertfordshire on the 9th of March 1600.

His other works are Pan his Syrinx, or Pipe, Compact of Seven Riddles (1585), a collection of prose tales; and a translation of the Menandres of Plutarch (1585). Albion's England consisted originally of four "books," but the number was increased in successive issues, and a posthumous edition (1612) contains sixteen books. It was reprinted (1814) in Alexander Chalmers' English Poets.

WARNSDORF, a town of Bohemia, Austria, 124 m. N.E. of Prague by rail. Pop. (1900) 31,350. Warnsdorf was founded in 1870 by uniting seven separate village communities, and is now one of the largest towns in Bohemia. It is a great industrial centre, especially for textiles.

WAROBA, a town of British India, in Chandia district of the Central Provinces, on a branch of the Great Indian Peninsula railway. Pop. (1901) 10,626. Warora gives its name to a coalfield, which was worked by the government from 1871 to 1906; a fire-clay industry under the same management also raises bricks and tiles. The pinning and pressing of cotton is an important industry.

WARRANT (Med. Lat. warrantum; O. Fr. garant, warrant, derived from O.H.G. root represented in modern German by gewähren), in English law, an authority in writing empowering a person to do an act or to execute an office. The procedure known as quo warranto (q.v.) is used to determine the right to hold certain kinds of public office. The term "warrant" occurs very early in constitutional documents: it is found in the Assize of Clarendon and the Assize of the Forest, both in the reign of Henry II., but in neither case in its modern meaning. Warrants were formerly used to settle or to challenge the right of certain great officers of state to interfere with personal liberty, especially as to offences of state. The legality of these proceedings was challenged by the judges in Elizabeth's reign. On the abolition of the Star Chamber it was enacted (16 Can c. 10) that if any person

1. Executive and Administrative.--While the royal prerogative was in the hands of the executive departments, warrants were authorized by royal warrant (per speciale mandatum regis), which, now either depend on statute or are dealt with by departments of state. The warrant, however, remains a quasi-judicial document, as it applies to a great variety of documents of very different kinds, which may be classified as (1) executive or administrative, (2) judicial or quasi-judicial and (3) financial or commercial.

1. Executive and Administrative.--While the royal prerogative was in the hands of the executive departments, warrants were authorized by royal warrant (per speciale mandatum regis), which, now either depend on statute or are dealt with by departments of state, though the warrant, however, remains a quasi-judicial document, as it applies to a great variety of documents of very different kinds, which may be classified as (1) executive or administrative, (2) judicial or quasi-judicial and (3) financial or commercial.

The warrant is a legal document (q.v.) which has been specially granted or issued by the King, and which is necessary in order to legalise an act of which otherwise it would be unlawful or invalid.

Warrant.--"Warrant" (Lat. warrantum) is an English word, which is derived from the Ger. Wortunah, wortunah ('license'), and is applied to a legal document, confirmed or given by the King, enabling a person to carry into execution some act which otherwise would be an illegal or unlawful act. It is an authority to do, or to execute an office. It is therefore, by definition, a permission, and not a prohibition, and is an instrument of public law, which distinguishes it from the private warrant, which is a private document, and is given to procure the arrest of a person by authority of a private individual, such as a sheriff, constable, or landlord.

The warrant is a legal document (q.v.) which has been specially granted or issued by the King, and which is necessary in order to legalise an act of which otherwise it would be unlawful or invalid.

Warrant.--"Warrant" (Lat. warrantum) is an English word, which is derived from the Ger. Wortunah, wortunah ('license'), and is applied to a legal document, confirmed or given by the King, enabling a person to carry into execution some act which otherwise would be an illegal or unlawful act. It is an authority to do, or to execute an office. It is therefore, by definition, a permission, and not a prohibition, and is an instrument of public law, which distinguishes it from the private warrant, which is a private document, and is given to procure the arrest of a person by authority of a private individual, such as a sheriff, constable, or landlord.
be imprisoned by warrant of the king in person, of the council board, or of any of the privy council, he is entitled to a writ of habeas corpus as a matter of course. The law provides for the arrest of any person found in the county, or out of the county, where the warrant was issued, by a constable or justice of the peace. The warrant must be served within 14 days after the arrest, and the person must be brought before the court within 40 days after the arrest, or be discharged by habeas corpus.

The warrant for arrest must be executed by a constable or other officer authorized by law. The warrant must be in writing and signed by the officer or justice who issued it. The warrant must state the name of the person to be arrested, the offense for which the warrant is issued, and the place where the person is to be found. The warrant must be served on the person to be arrested within 24 hours after it is issued.

In cases where the warrant is issued for the purpose of executing a sentence of imprisonment, the warrant must be served on the person to be imprisoned within 24 hours after the sentence is made.

In cases where the warrant is issued for the purpose of executing a sentence of imprisonment, the warrant must be served on the person to be imprisoned within 24 hours after the sentence is made.

**WARRANT OF ATTORNEY.** A warrant of attorney to confess judgment is a security for money (now practically obsolete) in the form of an authority to a solicitor named by a creditor, empowering him to sign judgment in an action against the debtor for the sum due, with a defeasance, or clause that the judgment shall not be enforceable in case of default in paying the money secured. It was often used as a collateral security, either for the payment of an annuity or with mortgages, in any other part of the British islands (see Summary Jurisdiction).

There is also a special provision as to executing warrants in the border counties of England and Scotland. The Criminal Offenders Act 1881 provision is made for the issue of warrants in aid of foreign and colonial justice; but the foreign and colonial provisions are not applicable to the United Kingdom.

The word "warrant" is used as is to a few judicial or quasi-judicial matters of civil concern, e.g., warrant to arrest a ship in an admiralty action in rem; and in the county courts warrants to the bailiffs of the counties for the apprehension of persons specified. In either event, a judicial remedy derived from feudal relations between lord and vassal. Arrest in civil or quasi-civil proceedings is in certain cases effected by a warrant, a written order given by the judge or justice of the court for his attendance (Bankruptcy Act 1883, s. 25), and in certain cases where justices have summary jurisdiction.

Financial and Commercial.—Payment out of the treasury is generally made upon warrant. Treasury warrants are regulated by many of the acts dealing with the national debt.

Payment of dividends by trading corporations and companies is generally made by means of dividend warrants. Mercantile warrants are also known as a right to the debt of others, and are often those deposited at a dock or warehouse, and by mercantile custom regarded as documents of title to the goods to which they relate. They are known as warehouse warrants, consignment warrants, or bills of lading, in the latter case. (See Bills of Exchange.)

For payment of the principal of bonds and debentures, warrants are issued by the Secretary of State in favor of the Bank of England, or by the Bank of England in favor of the corporations or companies whose bonds and debentures are paid in the warrant form. The warrant may be for a sum of money, or for a sum of money and interest, or for the amount of the bond or debenture which is paid in the warrant form. The warrant may be in favor of a single corporation or company, or in favor of a group of corporations or companies. The warrant may be issued for the payment of the principal or interest of the bond or debenture.

Warrants for the payment of money are issued by the United States government in the form of Treasury warrants. These warrants are payable upon the presentation of the warrant to the treasurer of the United States, or to the paymaster of the United States, or to any other authorized person or officer, as the warrant may provide. The warrant must be signed by the secretary of the treasury.

**WARRANT OF ATTORNEY.** A warrant of attorney to confess judgment is a security for money (now practically obsolete) in the form of an authority to a solicitor named by a creditor, empowering him to sign judgment in an action against the debtor for the sum due, with a defeasance, or clause that the judgment shall not be enforceable in case of default in paying the money secured. It was often used as a collateral security, either for the payment of an annuity or with mortgages, in any other part of the British islands (see Summary Jurisdiction).
order that the mortgage, by entering up judgment, might obtain priority in the administration of the assets of the mortgagor. The Debtor's Act 1860 contained various provisions for making known to the debtor the extent of the liability incurred by him, among others that the warrant must be executed in the presence of a solicitor named in the warrant, and that it and the defiance must be written on the same paper. A warrant of attorney must be duly stamped, generally as a mortgage (q.v.), and must be registered as a judgment in the central office of the Supreme Court.

WARRANT-OFFICER. In the British navy, the name given to officers who rank next to those who hold commissions, being appointed by warrant. They include the master, pursuer, surgeon, gunner, boatswain and carpenter, the first three being of "ward-room rank," i.e. messing with the lieutenants. In the military forces a warrant-officer is an appointed office above warrant, ranks below the commissioned officers and above the non-commissioned officers. A warrant-officer often holds an honorary commission.

WARRANT, etymologically, another form of GUARANTEE (q.v.). It is used, however, in a rather different sense. The sense common to both words is that of a collateral contract, under which responsibility for an act is incurred, and for the breach of which an action for damages lies. Warranty generally expresses the responsibility of the person doing the act, guarantee the responsibility of some other person on his behalf. A warranty may be either a written or an oral declaration of an absolute, or implied statement of something which the party undertakes shall be part of the contract, and, though part of the contract, collateral to the express object of it" (Chater v. Hopkins, 1838, 4 M. & W. 404). It differs from a condition in that a condition forms the basis of the contract and a breach of it discharges from the contract, and from a representation in that the latter does not affect the contract unless made a part of it expressly, or by implication as in contracts of insurance and other contracts uberrimae fidei, or unless it be fraudulent. These distinctions are not always accurately maintained. Thus in the Real Property Act 1845, § 4, a condition seems to be used for warranty.

Warranty as it affected the law of real property was, before the passing of the Real Property Limitation Act 1833 and the Fines and Recoveries Act 1833, a matter of the highest importance. A warranty in a conveyance was a covenant real annexed to an estate of inheritance or to an estate in possession, and in a lease was a warranty implied in cases where a feudal relation might exist between feoffor and feoffee. The warranty, as described by Littleton, § 697, was an obligation to render good and sufficient title to the land.

At the time of Glanvill the heir was bound to warrant the reasonable donations of his ancestor. Warranty was one of the elements in Bracton's definition of homage, 78b, "4 juni versum, qui hominem dominum deductum atque acquietandum tenetem sui in sequa, ens." For an express warranty the word warranty or warranty was necessary. The word warranty is used instead of a certain kinds of partition. In order to bind heirs a clause of warranty was required. This was either lineal, collateral or commencing by devise. The differences between the three kinds were very technical, and depended on abstruse and obsolete learning. They are treated at great length in old works on real property, especially Coke upon Littleton by Butler, 3646. The feoffor or his heirs were bound by voucher to warranty or judgment in a writ of warranty where the warranty is the subject of the suit and not merely the subject of the voucher. Vouching to warranty was a part of the old fictitious proceedings in a common recovery in use for the purpose of barring an execution, as in the Fines and Recoveries Act 1833, in the Land Registry and in the Law of Nature, as far as it relates to the conveyance of real estate, though not actually abolished in all possible cases, is now superseded by covenants for title. The more usual of these are now by the Conveyance instead of warranty is used to express the idea of warranty. For the different warranties of title and quality see SALE OF GOODS. Vouching to warranty was at one time important in the law of personality as well as of reality. The procedure is fully described in Glanvill. The right of calling on the holder of lost or stolen goods to vouch to warranty (intercitate), i.e. to give up the name of the person from whom he received them, under pain of forfeiture, was often granted in cases which involved a personal liability, as it exists as present in the law of personality, is either express or implied. There is no general rule as to what constitutes a warranty. It is not necessary that an express warranty should be in writing, the law being that every agreement by which the security of one's chattels is a warranty, provided that it appears to have been so intended. The principal cases of implied warranty occur in the contracts of sale and hire, and shelter and hire of a ship. In other cases of implied warranty the warranty may be excluded by the specific terms of the contract, such as a warranty of condition may be brought directly, or the breach may be used as ground for a counter claim or for reduction of damages, but the breach will not terminate the contract. A warranty may be implied by a rescission of the contract. Thus in a sale the property passes although the warranty be broken. In some cases warranties on sale are the subject of statutory enactments, as the Merchandise Marks and Sale of Food and Drugs Acts. In some other acts, such as the Bills of Exchange Act 1882, the term warranty does not occur, but the practical effect is the same.

Scotland.—The term corresponding to warranty in the law of heritable property is warandice, strictly speaking, seems confined to movables. Warrandice appears early in Scots law, the heir by Regiam Majestatem being bound to warrant the reasonable donations of his ancestor. Warrandice in the existing law is either real or personal. Real warrandice is that whereby warrandice lands are made over, as indemnity for those conveyed, to assure the person to whom they were conveyed from loss by the appearance of a superior title. Real warrandice is implied in ex-cambion. Its effect is that the exchanger, in case of eviction, may recover possession of his original lands. This is not in accordance with the English law in exchange. Personal warrandice is either express or implied. Express warrandice is either simple, against the future acts of the persons, or general, against the acts of all persons. It is implied, or in the absence of positive law, or against all persons, or against everyone, or against all persons, or against all. It is on any ground existing before the sale. A clause of warrandice is the Scottish equivalent of the English covenants for title. By the Titles to Land Consolidation (Scotland) Amendment Act 1869 a clause of warrandice in a charter is given in the schedule to the act imports absolute warrandice as regards the lands and the title-deeds thereof, and warrandice from fact and deed as regards the rents.

United States.—Warranty in conveyances of real estate is expressly abjured by statute in many states. In some states warranty is implied on the transfer and indorsement of negotiable instruments. (J. W.)

WARREN, GOUVENEUR KEMBLE (1820-1882), American soldier, was born at Coldspring, New York, on the 8th of February 1820, and entered West Point in 1846, graduating in 1850. He was assigned to the engineers, and for several years was employed in survey work in the West, where he took part in some expeditions against the Indians. In 1859 he was made assistant instructor in mathematics at West Point. But two years later, at the outbreak of the Civil War, the scientific subaltern was made lieutenant-colonel of volunteers and posted to the newly raised 4th New York Volunteer Infantry. He was fully equal to the task, for his regiment was very soon brought into a state of marked efficiency. In August he was promoted colonel. He led a brigade at Gaines's Mill, Second Bull Run and Antietam, and was shortly afterwards promoted brigadier-general of Volunteers. During the Fredericksburg campaign he was on the engineer staff of the Army of the Potomac, but after Chancellorsville he was appointed chief of engineers in that army, and in that capacity rendered brilliant services at Gettysburg (q.v.), his reward being promotion to major-general U.S.V. and the brevet of colonel in the regular army. When the Army of the Potomac was reorganized in the spring of 1864 Warren returned to the V. corps as its commander.

His service in the V. corps (q.v.) campaigns proved his fitness for this large and responsible command, but his naturally lively imagination and the engineer's inbred habit of caution combined to make him a brilliant but somewhat unsafe subordinate. He would have become one of the great chiefs of staff of history, or even a successful army commander, but he sometimes failed where a less highly gifted man would have succeeded. He was at his best when the military situation depended on his exercising his initiative, as on the first day in the Wilderness, in which his action saved the army, at his worst when, as on the 10th of May at Spotsylvania, he missed his chance to strike a decisive blow. On the latter occasion both Grant and Meade threatened to relieve him of his command, and Humphreys, the chief of staff of the army, was actually sent to control the movements of the V. corps. Similar incidents took place in later stages of
the campaign, and at last, at the critical moment preceding the battle of Five Forks, Sheridan, who was in charge of the operations, was authorized by Grant to relieve Warren of his command (1864-5). The thoughtful Warren and the eager, violent Sheridan were ill-matched. At the outset the V. corps, being no longer composed of the solid troops of 1862 and 1863, fell into confusion, which Warren exerted himself to remedy, and in the event the battle was an important Union victory. But after it had ended Sheridan sent for Warren and, with no attempt to soften the blow, relieved him of his command. A court of inquiry was subsequently held, which entirely exonerated Warren from the reckless charges of apathy, almost of cowardice, which Sheridan brought against him. Shortly after Five Forks Warren resigned his volunteer commission, and received the brevet of brigadier-general in the regular army. After the war he was employed, in the substantive rank of major (1879 lieutenant-colonel) of engineers, in survey work and harbour improvements. General Warren died on the 8th of August 1892 at Newport, R.I. A statue to his memory was erected at Round Top, on the field of Gettysburg, on the sixth anniversary of his death.

WARREN, SIR JOHN BORLASE, Bart. (1753-1822), English admiral, was born at Stapleford, Nottinghamshire, on the 2nd of November (1752), being the son of John Borlase Warren (d. 1750) of Stapleford and Little Marlow. He was educated at Emmanuel College, Cambridge, and in 1773 entered the navy as an able seaman; in 1774 he became member of parliament for Marlow; and in 1775 he was created a baronet, the baronetcy held by his ancestors, the Borlases, having become extinct in 1689. His career as a seaman really began in 1777, and two years later he obtained command of a ship. In April 1794, in charge of a squadron of frigates, Warren captured three French frigates, and in similar ways he did excellent service for some time in protecting British trade. In 1796 he was raised to the rank ofcaptained or destroyed 220 vessels. Perhaps his best deed in the service was the defeat in October 1798 of a French fleet, carrying 3000 men, which it was intended to land in Ireland, a plan which he completely frustrated. In 1802 he was sent to St Petersburg as ambassador extraordinary, but he did not forsake the sea, and in 1806 he captured a large French warship, the "Marengo." He became an admiral in 1810, and was commander-in-chief on the North American station in 1813-1814. He died on the 27th of February 1852. His two sons preceded their father, and his daughter and heiress, Frances Mary, married George Charles Vanables-Vernon, 4th Lord Vernon (1779-1853). Their son was George John Warren Vernon, 5th Lord Vernon (1803-1860).

WARREN, JOSEPH (1741-1775), American politician, was born at Roxbury, Massachusetts, on the 11th of July 1741. He graduated from Harvard College in 1759, taught in a school at Roxbury in 1760-1761, studied medicine, and began to practise in Boston in 1764. The Stamp Act agitation aroused his interest in public questions. He soon became associated with Samuel Adams, John Adams and Josiah Quincy, Jr., as a leader of the popular party, and contributed articles and letters to the Boston Gazette over the signature "True Patriot." The efforts of Samuel Adams to secure the appointment of committees of correspondence met with his hearty support, and he and Adams were the two leading members of the first Boston committee of correspondence, chosen in 1772. As chairman of a committee appointed for the purpose, he drafted the famous "Suffolk Resolves," which were unanimously adopted by a convention at Milton (26th) on the 9th of September 1774. These " resolves" urged forcible opposition to Great Britain if it should prove to be necessary, pledged submission to such measures as the Continental Congress might recommend, and favoured the calling of a provincial congress. Warren was a member of the first three provincial congresses (1774-1775), president of the third, and an active member of the committee of public safety. He took an active part in the fighting on the 19th of April, was appointed major-general of the Massachusetts troops, next in rank to Artemas Ward, on the 14th of June 1775; and three days later, before his commission was made out, he took part as a volunteer, under the orders of Putnam and Prescott, in the battle of Bunker Hill (Breed's Hill), where he was killed. Next to the Adamses, Warren was the most influential leader of the extreme Whig faction in Massachusetts. His tragic death strengthened their zeal for the popular cause and helped to prepare the way for the acceptance of the Declaration of Independence. Warren's speeches are typical examples of the old style of American political eloquence. His best-known orations were those delivered in Old South Church on the second and fifth anniversaries (1777 and 1775) of the "Boston Massacre."

The standard biography is Richard Frothingham's Life and Times of Joseph Warren (Boston, 1856).

WARREN, MERCY (1728-1814), American writer, sister of James Otis (q.v.), was born at Barnstable, Mass., and in 1754 married James Warren (1726-1808) of Plymouth Mass., a college friend of her brother. Her literary inclinations were fostered by both these men, and she began early to write poems and prose essays. As member of the Massachusetts House of Representatives (1756-1774) and its speaker (1756-1777 and 1787-1788), member (1776 and 1775) and president (1775) of the Provincial Congress, and paymaster-general in 1777, James Warren played a prominent part in the events of the American revolutionary period, and his wife followed its progress with keen interest. Her gifts of satire were utilized in her critical works, The Adulator (1775) and The Group (1775); and John Adams, whose wife Abigail was Mercy Warren's close friend, encouraged her to further efforts. Her tragedies, "The Sack of Rome" and "The Ladies of Castle," were included in her Poems, Dramatic and Miscellaneous (1790), dedicated to General Washington, as being the opening part of the events of American literature. Mercy Warren's poems have no permanent value. In 1801 she published a History of the American Revolution (1775-1783; new ed., 1803) and his Life of John Adams (1772-1803); both of which were extensively reprinted to form part of the Whig party's platforms, and which were bitterly resented by John Adams (see his correspondence, published by the Massachusetts Historical Society, 1878). James Warren died in 1808, and his wife followed him on the 19th of October 1814.

See Elizabeth F. Ellet, Women of the Revolution (1856; new ed., 1900); an article by Annie Russell Marble in the New England Magazine (April 1903); Alice Brown, Mercy Warren (New York, 1903).

WARREN, MINTON (1855-1907), American classical scholar, was born at Pawtucket, Rhode Island, on the 29th of January 1850, a descendent of Richard Warren, who sailed in the "Mayflower" in 1620. He was educated at Tufts College and subsequently at Yale. After three years as a schoolmaster, he went to Germany to complete his studies in comparative philology and especially in Latin language and literature. Having taken the degree of doctor of philosophy at Strassburg in 1879, he returned to the United States as Latin professor at Johns Hopkins University. In 1899 he was appointed Latin professor at Harvard. His life-work was a new edition of Terence, which, however, he left unfinished at his death. He was director of the American School of Classical Studies in Rome (1890-1891), and president of the American Philological Association (1898). Among his publications are: "Enctic Ne in Early Latin" (Strassburg dissert., reprinted in Amer. Journ. of Philol., 1881); On Latin Glossaries, with especial reference to the Codex Sangen- lensis (St Gall Glossary) (Cambridge, U.S.A., 1885); The Siete Inscription in the Roman Forest (Amer. Journ. of Philol., vol. xxvii. No. 3, and separately in 1898). He died on the 26th of November 1907.

WARREN, SAMUEL (1807-1877), English lawyer and author, son of Dr Samuel Warren, rector of All Souls', Ancots, Manchester, was born near Wrexham in Denbighshire on the 23rd of May 1807. The elder Samuel Warren (1781-1862) became a Wesleyan minister, but was expelled by Conference in 1835 on account of his attitude towards proposals for the establishment of a theological training college at Manchester. He formed a
WARREN, W.—WARRENSBURG

new association, the members of which were nicknamed Warrenites, and this developed into the United Methodist Free Churches. Warren himself took orders in the Church of England. His son, the younger Samuel Warren, studied medicine at the University of Edinburgh, but abandoned this to study for the English bar. He entered the Inner Temple in 1828, and was successful in his profession. He took silk in 1831, was made recorder of Hull in 1832, represented Midhurst in parliament for three years (1835-1859) and was rewarded in 1859 with a mastership in lunacy. He had already written a good deal on the subject of insanity in its legal aspects, and he was always a determined opponent of the rising school of medical alienists who were more and more in favour of reducing certain forms of crime to a state of mental aberration which should not be punished outside of asylums. Meantime he had made much more brilliant success in fiction. Very early in his career he had begun to write for Blackwood. His Passages from the Diary of a Late Physician were published in that magazine between August 1830 and August 1837, and appeared in collected form in 1838. These realistic short stories, with a somewhat morbid interest shielded under a moral purpose, were extremely popular. Warren's brief experience as a medical student thus stood him good stead. But his great success was Ten Thousand a Year, which ran in Blackwood from October 1830 to August 1841, and was published separately immediately on its conclusion. Critics complained of the coarse workmanship, the banality of the moralizing, the crudeness of the pathos, the farcical extravagance of the humour; but meantime the work proved one of the most popular novels of the century. Of the higher qualities of imagination and passion Warren was destitute, but his sketches of character, especially farcical character—Tittlebat Titmouse, Oily Gammon, Mr Quicksilver (an open caricature of Lord Brougham)—are bold and strong, forcibly impressed on the memory, and the interest of the story is made to run with a powerful current. From 1841 to 1846 Warren was known as the author of Ten Thousand a Year, and many tales were told of his open pride in the achievement. In 1847 he made another venture, but Now and Then was not a success. The Lily and the Bee, a squib on the Crystal Palace, published in 1851, though it had the honours of translation into Italian, was a signal failure. A pessimistic dissertation on The Intellectual and Moral Development of the Age, published in 1853, also fell flat, and thenceforward Warren, after publishing his Works: Critical and Imaginative, in four volumes in 1854, retired on his laurels. He died in London on the 29th of July 1877.

Warren also wrote several legal works of repute—Introduction to Law Studies (1835), Extracts from Blackstone (1837), Manual of Parliamentary Law (1852).

WARREN, WILLIAM (1812-1888), American actor, was born in Philadelphia on the 17th of November 1812, the son of an English actor (1767-1832) of the same name. His first stage appearance was made there as Young Norval in Home's Dogues in 1832. A dozen years of wandering theatrical life followed, giving him a wide experience in every kind of part, the last few in comedy in a company headed by his brother-in-law, J. B. Rice. In 1846 he made his first appearance in O'Tigger in The Rivals at the Howard Athenaeum, and in the next season he became a member of the Boston Museum, in which stock company he remained for thirty-five years. Here he held his "Golden Jubilee" on the 28th of October 1882. He died on the 21st of September 1888.

WARREN, a city and the county-seat of Trumbull county, Ohio, U.S.A., in the N.E. part of the state, on the Mahoning river, about 30 m. S.E. of Cleveland, and 14 m. N.W. of Youngstown. Pop. (1890) 973, (1900) 829 (1671 foreign-born); (1910) 11,891. Warren is served by the Erie, the Pennsylvania, and the Baltimore & Ohio railways. The city has a public library and a hospital. The surrounding country is devoted to farming, dairying and coal and iron mining. The total value of the factory products in 1905 was $2,447,370. The first permanent white settlement on the site of Warren (then owned by Connecticut) was made in 1799 by settlers from Washington county, Pennsylvania. Warren was named in honour of a surveyor—Moses Warren, of New Lyme, Connecticut—employed by the Connecticut Land Company, which sold the land to the first settlers. The county was named in honour of Governor Jonathan Trumbull of Connecticut. Warren was chartered as a city in 1834. For several years before September 1909 Warren was the national headquarters of the National American Woman's Suffrage Association.

See History of Trumbull and Mahoning Counties (2 vols., Cleveland, Ohio, 1882), and H. T. Upton, History of Trumbull County (Chicago, 1910).

WARREN, a borough and the county-seat of Warren county, Pennsylvania, U.S.A., on the N. side of the Allegheny river at the mouth of the Conewango river, about 35 m. N.E. of Titusville. Pop. (1880) 2818; (1890) 4332; (1900) 8043, of whom 1259 were foreign-born; (1910 census) 11,050. The foreign element is largely Swedish, Danish and Slavish. Warren is served by the Pennsylvania and the Dunkirk, Allegheny Valley & Pittsburg railways, and by electric railway to Jamestown, New York. Among the public buildings and institutions are the county court house, a state hospital for the insane (established 1873), a Y.M.C.A. building and a state armory. Warren is situated at the southern foot of a high sheer ridge, in a region rich in natural gas; the borough shires and refining oil, and has various manufactures. The total value of its factory product in 1905 was $5,976,002 (62.4% more than in 1899), of which $3,068,504 was the value of refined oil and $1,220,165 the value of foundry and machine-shop products. The borough owns and operates the water-works and the electric lighting plant. The town site of Warren was laid out by commissioners appointed by Governor Thomas Millinn in 1795, and Warren was incorporated as a borough in 1832; it was named in honour of Joseph Warren, the American patriot. In 1805 part of Glade township was annexed.

See J. S. Schenck and W. S. Rahn, History of Warren County, Pennsylvania (Syracuse, N.Y., 1887).

WARREN, properly an old term of the English forest law, derived from the O. Fr. warene, varenne, garcine (med. Lat. warena, warir, to guard, cf. "ward"), and applied to one of the three lesser franchises, together with "chase" and "park," included under the highest franchise, the "forest," and ranking last in order of importance. The "beasts of warren" were the hare, the coney (i.e. rabbit), the pheasant and the partridge. The word thus became used of a piece of ground preserved for these beasts of warren. It is now applied loosely to any piece of ground, whether preserved or not, where rabbits breed (see FOREST LAWS).

WARRENS POINTE, a seaport and watering-place of county Down, Ireland, the terminus of a branch of the Great Northern railway, by which it is 501 m. S.S.W. of Belfast. Pop. (1901) 1817. It lies on the northern shore of the beautiful Carlingford Lough; behind it rise the Mourne Mountains, while across the lough are the Carlingford Hills, with Sleive Gullion. These hills afford shelter from inclement winds, and give Warrenpoint and other neighbouring watering-places on the lough a climate which renders them as popular in winter as in summer. There is a quay here where large vessels can discharge, and agricultural produce is exported. The shores of the lough are studded with country seats lying picturesquely on the well-wooded hill slopes; and nearly 3 m. E. of Warrenpoint (connected by tramway) is Rosstrevor, one of the most noted watering-places in Ireland, charmingly situated in a position open to the sea, but enclosed on the north and east.

WARRENSBURG, a city and the county-seat of Johnson county, Missouri, U.S.A., on a hilly site near the Blackwater Fork of the La Mine river, in the west central part of the state, about 65 m. S.E. of Kansas City. Pop. (1880) 4766; (1900) 4724, including 556 negroes and 127 foreign-born; (1910) 4680. It is served by the Missouri Pacific railway. The city is the seat of a state normal school (opened in 1872), and among the prominent buildings are the court house and the railway station, both built of local sandstone. Pertle Springs, about 1 1/2 m. S.,
WARRINGTON—WARRINGTON, LORD

is a summer resort. Warrensburg is a shipping and supply point for a rich farming region. In the immediate vicinity there are extensive quarries of a blue sandstone, one of the best building stones of the state. Warrensburg was made the county and seat in 1836. Its settlement dates from a little earlier. The present city is not on the site of the original settlement, but is near it; the old town was abandoned in 1837, when the railway passed by it. During the Civil War Warrensburg was a Union post.

WARRINGTON, a market town and municipal and parliamentary borough of Lancashire, England, on the river Mersey, midway between Manchester and Liverpool, and 182 m. N.W. by N. from London by the London & North-Western railway. Pop. (1801) 53,588; (1901) 64,242. It has extensive local connotations by way of the Cheshire lines. The church of St Elphin is a fine cruciform building with lofty central tower and spire. The style is Decorated, but restoration has been heavy. A much earlier church formerly occupied the site, and of this the crypt remains beneath the existing chancel. The town hall, a classical building of the 18th century, was formerly a residence, and was purchased by the corporation in 1872, while the park in which it stands was devoted to public use. The other chief buildings are the museum and free library, with together some 17,000 volumes and 200,000 sheets. The educational institutions include a free grammar school, founded by one of the Boteler family in 1526, and a blue-coat school (1663). A few half-timbered houses of the 17th century remain in the streets. A wide system of electric tramways and district light railways is maintained by the borough. Warrington and the neighbourhood are an important centre of the tanning industry. There are also iron bar, hoop and wire works, tool, soap, glass and chemical works, foundries and cotton mills. Considerable agricultural markets and fairs are held. The parliamentary borough (1832), returning one member, extends into Cheshire. The town is governed by a corporation consisting of a mayor, 9 aldermen and 27 councillors. Area 3,628 acres.

Warrington (otherwise Walton, Wirrington, Wirtington) is supposed to be of British origin, and the great Roman road from Chester to the north passed through it. There was a Romano-British village—perhaps also a military post—at Wilderspool. It is mentioned in Domesday Book as the head of a hundred. After the Conquest it became one of the possessions of Roger de Poitou. In Henry I.'s reign a barony was formed for Pain de Vilears, of which Warrington was the head and to which it was added the town and city. The barony passed to the Botelers or Butlers, who first established their residence on the mote hill and before 1280 built Bewsey in Burton wood. The Butlers held both barony and manor till 1536, when the barony lapsed and the manor passed after some vicissitudes to the Irelands of Bewsey, then to the Booths and in 1769 to the Blackburns. In 1255 William le Boteler obtained a charter from Henry III. for an annual fair to last three days from the eve of St Thomas the Martyr (8th July). In 1277 Edward I. granted a charter for a weekly market on Friday and an annual fair of eight days beginning on the eve of St Andrew (30th Nov.), and in 1285 another charter changing the market day from Friday to Wednesday and extending the summer fair to eight days. The market and fairs had, however, existed before the granting of these charters. Blome in 1673 speaks of Warrington market as an important one "for linen cloth, corn, cattle, provisions and fish, being much resorted to by the Welshmen," and in 1730 Defoe says the market was especially famous for "a sort of table linen called Huk-a-back or Huk-a-buk." The fairs are still held, as well as the Wednesday chartered market, besides a Saturday market which is probably customary. In the 18th and early 19th centuries the chief industries were huckabacks and coarse cloths, canvases, fustians, pins, glass, sugar-refining and copper. During the Civil War the inhabitants embraced the royalist cause and the earl of Derby occupied the town and made it for some time his headquarters in order to secure the passage of the Mersey. In April 1643 the parliamentary forces attacked it, but had to raise the siege, as Lord Derby began to set the town on fire. Lord Derby left Colonel Edward Norris in command and in May the parliamentarians again attacked the town, which was forced to surrender after a six days' siege owing to lack of provisions. In 1648, after the royalist defeat at Winwick by Cromwell, part of the royal forces under General Baillie rallied at Warrington, hoping to effect the passage of the bridge, but failed, and the general with 4,000 men capitulated. In August 1659 Sir George Booth, lord of the manor, was defeated at Winnington, and part of his forces surrendered at Warrington to the parliamentary garrison. During the Rebellion of 1745, on the approach of Prince Charles Edward from Manchester, the bridge was cut down and the few stragglers who ventured that way seized. A borough was created by William le Boteler about 1320 by a charter which has since been preserved; but its growing strength alarmed the lord who contrived to repress it before 1300, and for over 500 years Warrington was governed by the lord's manor court. A charter of incorporation was granted in 1837. By the Reform Act of 1832 the town returns one member to parliament. The church dedicated to St Elphin is mentioned in Domesday Book, and was in early times head of the ancient deanery of Warrington. There was a friary of Augustine or Hermit Friars here founded apparently about 1280.

B校友, THOMAS, 1st BISHOP JOHNSTON, LORD (1611-1663), Scottish judge and statesman, son of James Johnston (d. 1617), a merchant burgess of Edinburgh, was baptized on the 28th of March 1611, educated at Glasgow, and passed advocate at the Scottish bar in 1633. He first came into public notice in 1637, during the attempt of Charles I. to force the English liturgy upon Scotland, when as the chief adviser of the Covenanting leaders he drew up their remonstrances. On the 28th of February 1638, in reply to a royal proclamation, he read to an enormous multitude assembled in Greyfriars churchyard at Edinburgh and in presence of the heralds, a strong protestation, and together with William Alexander, Earl of Danby, proposed a national form of church government. After the Declaration of Indulgence of 1638, drawing up himself the second part, which consisted in a recapitulation of all the acts of parliament condemning "popery" and asserting the liberties of the Scottish church. He was appointed clerk to the tables, and also clerk and afterwards procurator or counsel to the general assembly held at Glasgow the same year, when he was the means of restoring several missing volumes of records. In June 1639 he took part in the negotiations leading to the treaty of Berwick, when his firm attitude was extremely displeasing to the king. He opposed Charles I.'s desire to ​​form the east in an assembly, since this would restrict all future assemblies, to which Charles replied "that the devil himself could not make a more uncharitable construction or give a more bitter expression," and on Johnston's continuing his speech ordered him to be silent and declared he would speak to more reasonable men.\(^1\) In August he read a paper before the Scottish parliament, strongly condemning its prorogation. In the following year he was appointed to attend the general of the army and the committee, and on the 23rd of June, when the Scottish forces were preparing to invade England, he wrote to Lord Savile asking for definite support from the leading opposition peers in England and their acceptance of the National Covenant, which drew from the other side at first nothing but vague assurances and subsequently the engagement forced by Lord Savile with the signatures of the peers. In October he was a commissioner for negotiating the treaty of Ripon and went to London. He continued after the peace to urge the punishment of the incendiaries, and especially of Traquair, and in a private interview with the king strongly opposed the proposed act of general oblivion. On the king's arrival in Scotland in 1641 he led the opposition from the important constitutional point of the control of state appointments, supporting the claims of the parliament by an appeal to the state records, which he had succeeded in recovering.

In September Johnston received public thanks for his services from the Scottish parliament, and, in accordance with the policy of conciliation then pursued for a short time by the king, was awarded a pension of £200 a year and an annual salary of £50. However, he continued to hold the position of a commissioner for the treaty of Ripon and went to England in July 1641. He was then appointed to attend the general assembly of the army and the committee, and on the 23rd of June, when the Scottish forces were preparing to invade England, he wrote to Lord Savile asking for support. This was the first support that the opposition peers in England were ready to offer, and Johnston continued to urge the punishment of the incendiaries and especially of Traquair. In 1641 he led the opposition from the important constitutional point of the control of state appointments, supporting the claims of the parliament by an appeal to the state records, which he had succeeded in recovering.

1 Johnston's "Diary" in Scottish Hist. Soc. Publ., xxxvi. 84.
appointed on the 13th of November 1641, a lord of session, with the title of Lord Warriston (a name derived from an estate purchased by him near Edinburgh in 1636), was knighted, and was given a pension of £200 a year. The same month he was appointed a commissioner at Westminster by the parliament for settling the affairs of Scotland. He was a chief agent in concluding the treaty with the English parliament in the autumn of 1643, and was appointed a member of the committee of both kingdoms in London which directed the military operations, and in this capacity went on several missions to the parliamentary generals. He took his seat early in 1644 in the Assembly of Divines, to which he had been nominated, and vehemently opposed measures tolerating independency or giving powers to laymen in ecclesiastical affairs. The articles of the unsuccessful treaty of Uxbridge were, for the most part, drawn up by him the same year. Besides his public duties in England he sat in the Scottish parliament for the county of Edinburgh from 1643 till 1647, was speaker of the barons, and served on various committees. After the final defeat of Charles, when he had surrendered himself to the Scots, Johnstone was made in October 1646 king's advocate, and the same year was voted £3000 by the estates for his services. He continued to oppose unwise concessions to Charles, and strongly disapproved of the “engagement” concluded in 1648 by the predominant party with Charles at Carisbrooke, which, while securing little for Presbyterianism, committed the Scots to hostilities with the followers of Cromwell. His having become the leader of the remonstrants, the party opposed to the “engagement,” and during the ascendency of the engagers retired to Cantyre as the guest of Argyll. He returned again after the Whiggamor Raid, met Cromwell at Edinburgh in October after the defeat of the engagers at Preston, and in conjunction with Argyll promoted the act of Classes, passed on the 23rd of January 1649, disqualifying the royalists. The good relations now formed with Cromwell, however, were soon broken off by the king's execution, and Johnstone was present officially at the proclamation of Charles II. as king at Edinburgh, on the 5th of February 1649. On the 10th of March he was appointed lord clerk register. In May he pronounced the vindictive sentence on Montrose, and he is said to have witnessed with Argyll the victim being drawn to the place of execution. He was present at the battle of Dunbar (3rd of September 1650) as a member of the committee of estates, to which body is ascribed the responsibility for Leslie's fatal abandonment of his position on Doon Hill. After the defeat he urged the removal of David Leslie, afterwards Lord Newark, from the command, and on the 21st of September delivered a violent speech in Charles's presence, attributing all the late misfortunes to the Stuarts and to their opposition to the Reformation.

His first object in life being the defence of Presbyterianism, Johnstone could join neither of the two great parties, and now committed himself to the faction of the remonstrants who desired to exclude the king, in opposition to the resolutioners who accepted Charles. The latter for some time maintained their superiority in the kingdom, Johnstone being reduced to poverty and neglect. In the autumn of 1650 Johnstone went to London as representative of the remonstrants, and soon afterwards, on the 7th of July 1657, he was restored by Cromwell to his office of lord clerk register, and on the 3rd of November was appointed a commissioner for the administration of justice in Scotland, henceforth remaining a member of the government till the Restoration. In January 1658 he was included by Cromwell in his new House of Lords, and sat also in the upper chamber in Richard Cromwell's parliament. On the latter's abdication and the restoration of the Rump, he was chosen a member of the council of state, and continued in the administration as a member of the committee of public safety, maintaining consistently his attitude against religious toleration. At the Restoration he was singled out for punishment. He avoided capture, escaping to Holland and thence to Germany, and was condemned to death in his absence on the 13th of May 1661. In 1663, having ventured into France, he was discovered at Rouen, and with the consent of Louis XIV. was brought to trial and imprisoned in the Tower of London. In June he was taken to Edinburgh and confined in the Tolbooth. He was hanged on the 22nd of July at the Market Cross, Edinburgh, the scene of many of his triumphs, and a few yards from his own house in High Street, which stood on the east side of what is now known as Warriston's Close. His head was exposed on the Netherbow and afterwards buried with his body in Greyfriars churchyard.

Johnston was a man of great energy, industry and ability, and the successful defence of their religion by the Scots was probably owing to him more than to any other man. He is described by his contemporary Robert Baillie as “one of the most faithful and diligent and able servants that our church and kingdom has had all the tymes of our troubles.” He was learned in the Scottish law, eloquent and deeply religious. His passionate devotion to the cause of the Scottish church amounted almost to fanaticism. According to the History by his nephew Bishop Burnet, “he looked on the Covenant as the setting Christ on his throne.” He had by nature no republican leanings; all the Royalists in Scotland,” writes Baillie as late as 1646, “could not have pleaded so much for the crown and the king's just powers as he, or spake or written as he did for Presbyterianism.” When, however, Presbyterianism was attacked and menaced by the sovereign, he desired, like Pym, to restrict the royal prerogative by a parliamentary constitution, and endeavoured to found his arguments on law and ancient precedents. His acceptance of office under Cromwell hardly deserves the severe censure it has received. He stood nearer both in politics and religion to Cromwell than to the royalists, and was able in office to serve usefully the state and the church, but his own scrupulous conscience caused him to condemn his speech, and he afterwards in his History described the act which he regarded as a moral fault committed in order to provide for his numerous family, and the remembrance of which disturbed his last hours. Johnstone was wanting in tact and in consideration for his opponents, confessing himself that his “natural temper (or rather distemper) hath been hasty and passionate.” He was hated by Charles I., whose statecraft was vanquished by his inflexible purpose, and by Charles II., whom he rebuked for his dissolute conduct; but he was beloved by Baillie, associated in private friendship and public life with Argyll, and lamented by the nation whose cause he had championed.

He had a large family, the most famous of his sons being James Johnstone (1655-1732), called “secretary Johnstone.” Having taken refuge in Holland after his father's execution, Johnstone crossed over to England in the interests of William of Orange just before the revolution of 1688. In 1692 he was appointed one of the secretaries for Scotland, but he was dismissed from office in 1696. Under Anne, however, he began again to take part in public affairs, and was made lord clerk register. Johnstone's later years were passed mainly at his residence, Oronsay House, Twickenham, and he died at Bath in May 1737.

See W. Morison, Johnstone of Warriston (1901).

WARRNAMBOOL, a seaport of Villiers county, Victoria, Australia, 166 m. by rail W.S.W. of Melbourne. Top. (1901) 6410. The town lies on an eminence, on the shores of Warrnambool Bay, in a rich pastoral and agricultural district. Race meetings are held here, and the steeplechase course is considered the finest in the colony. Warrnambool has a fine port with a viaduct and breakwater pier 2200 ft. in length, and a jetty 860 ft. in length, on to which the railway runs. Large quantities of dairy produce, wool and live stock are exported, and there is much activity of flourishing industries in the town, including brewing, flour-milling, tanning and boot and biscuit manufacturing. Sandstone

---

1 This was the name given to a successful raid on Edinburgh by a band of Argyll's partisans gathered mainly from the west of Scotland. It took place in September 1657, just after the death of Hamilton at Preston. The term Whiggam is said to be derived from Whiggam, a word used by the ploughmen in the west of Scotland to encourage their horses. See S. R. Gardiner, Great Civil War, vol. iii. (1891).

2 Baillie, Letters and Journals (Bannatyne Club, 1841.)
WARSAW

abounds in the district and is extensively quarried. The summer climate is the coolest in the Australian states.

WARSAW, a government of Russian Poland, occupying a narrow strip of land west of the lower Bug and west of the Vistula from its confluence with the Bug to the Prussian frontier. It is bounded by the Polish governments of Plock and Lomza on the N., Siedlce on the E., and Radom, Piotrkow and Kalisz on the S. Area 565 sq. m.; estimated pop. (1906) 2,269,000. It occupies the great plain of central Poland, and is low and flat, with only a few hills in the south, and along the course of the Vistula in the north-west, where the terraces on the left bank descend by steep slopes to the river. Terrible inundations often devastate the region adjacent to the confluence of the Vistula with the Narew and Bug, and marshes gather in the low-lying grounds. The soil, which consists chiefly of boulder clay, lacustrine clays, and sandy fluvialite deposits, is not particularly fertile. The government is divided into thirteen districts, the chief towns of which are Warsaw, Blonie, Gostynin, Grojec, Kutno, Lowicz, Nieszawa, Nove-Minek, Plonsk, Radzymin, Slkierzewiecz, Sochaczew and Wlodawiec. In spite of the unfertile soil, agriculture is prosecuted with considerable success. Manufacturing industries have also greatly developed.

WARSAW (Polish Warszawa, Ger. Warschau, Fr. Varsovie), the capital of Poland and chief town of the government of Warsaw. It is beautifully situated on the left bank of the Vistula, 387 m. by rail E. of Berlin, and 605 m. S.W. of St Petersburg. It stands on a terrace 120 to 150 ft. above the river, to which it descends by steep slopes, leaving a broad bench at its base. The suburb of Praga on the right bank of the Vistula, here 450 to 660 yds. broad, is connected with Warsaw by two bridges—the railway bridge which passes close under the guns of the Alexander citadel to the north, and the Alexander bridge (1666 ft. long; built in 1865 at a cost of f634,000) in the centre of the town. With its large population, its beautiful river, its ample communications and commerce, its university and scientific societies, its palaces and numerous places of amusement, Warsaw is one of the most pleasant as well as one of the most animated cities of eastern Europe. From a military point of view Warsaw is the chief stronghold for the defence of Poland; the Alexander citadel has been much improved, and the bridge across the Vistula is defended by a strong fort, Sliwicki.

Situated in a fertile plain, on a great navigable river, below its confluence with the Pilica and Wigrz, which drain southern Poland, and above its confluence with the Narew and Bug, which tap a wide region in the east, Warsaw became in medieval times the chief entrepot for the trade of those fertile and populous valleys with western Europe. Owing to its position in the territory of Mazovia, which was neither Polish nor Lithuanian, and so to new European political conditions, which constituted the United kingdom, it became the capital of both, and secured advantages over the purely Polish Cracow and the Lithuanian Vilna. And now, connected as it is by six trunk lines with Vienna, Kiev and south-western Russia, Moscow, St Petersburg, Danzig and Berlin, it is one of the most important commercial cities of eastern Europe. The south-western railway connects it with Lodz, the Manchester of Poland, and with the productive mineral region of Piotrkow and Kielce, which supply its steadily growing manufactures with coal and iron, so that Warsaw and its neighbourhood have become a centre for all kinds of manufactures. The iron and steel industry has greatly developed, and produces large quantities of rails. The machinery works have suffered to some extent from competition with those of southern Russia, and find the high price of land a great obstacle in the way of extension. But the manufactures of plated silver, carriages, boots and shoes (annual turnover £8,457,000), millinery, hosiery, gloves, tobacco, sugar, and all sorts of small artistic house decorations, are of considerable importance, chiefly owing to the skill of the workers. Trade is principally in the goods enumerated above, but the city is also a centre for trade in corn, leather and coal, and its two fairs (wool and hops) have a great reputation throughout western Russia. The wholesale deportations of Warsaw artisans after the Polish insurrections of 1794, 1831 and 1863 considerably checked, but by no means stopped, the industrial progress of the town. The barrier of custom-houses all round Poland, and the Russian rule, which militates against the progress of Polish science, technology and art, are so many obstacles to the development of its natural resources. The population has nevertheless grown rapidly, from 161,000 in 1860, 276,000 in 1872 and 436,750 in 1887, to 756,456 in 1901; of these more than 25,000 are Germans, and one-third are Jews. The Russian garrison numbers over 30,000 men. Warsaw is the see of the Bishop of the Greek Orthodox and Roman Catholic churches, and the headquarters of the V., VI. and XV. Army Corps.

The streets of Warsaw are adorned with many fine buildings, partly palaces exhibiting the Polish nobility's love of display, partly churches and cathedrals, and partly public buildings erected by the town or by the Fine public gardens and several monuments further embellish the city. The university (with 1500 students), founded in 1816 but closed in 1832, was again opened in 1869 as a Russian institution, the teaching being in Russian; it has a remarkable library of more than 100,000 volumes, rich in natural history collections, a fine botanic garden and an astronomical observatory. The medical school enjoys high repute in the scientific world. The school of arts, the academy of agriculture and forestry, and the university and private technical schools are very extensive. The association of the friends of science and the historical and agricultural societies of Warsaw were once well known, but were suppressed after the insurrections, though restored in 1863.

The theatre for Polish drama and the ballet is a fine building, which includes two theatres under the same roof: but the pride of Warsaw is its theatre in the Lazienki gardens, which were laid out in 1665 in an extensive park of the Vistula. The building, by Stanislaus Wodzicki, and have beautiful shady alleys, artificial ponds, an elegant little palace with ceilings painted by Racciarelli, several imperial apartments (1789) to John Sobieski, king of Poland, who delivered Vienna from the Turks in 1683. Here an artificial ruin on an island makes an open-air theatre. Two other public gardens, with alleys of old chestnut trees, are situated in the centre of the town. Of these, the Park Oliwski, a spacious garden which has a summer theatre and fine old trees, is one of the most beautiful in Europe; it is the resort of the Warsaw aristocracy. The Krasiiski garden is the favourite promenade of the Jews. The oval point of the town is the castle (Zamek Krolicki) on Sigismund Square. It was built by the dukes of Mazovia, enlarged by Sigismund III. (whose memorial stands opposite), and Ladislaus IV., and embellished by John Sobieski and Stanislaus Pomatowski. At present it is inhabited by the "governor-general of the provinces on the Vistula" (i.e. Poland), and by the military authorities. Most of its pictures and other art treasures are removed from it to the National Museum. The Park of Remembrance, one of the most beautiful places in Europe, has several thousand trees, and through the Emerson radiates from it; one, the Krakowski Przedmiescie, the best street in Warsaw, runs southward. It is continued by the Nowy Świat and the Ujazdowska Aleja, which leads to the Lazienki gardens, Mazowska Aleja, which leads to two streets: the church of St Anne (1543), which belonged formerly to a Bernardine monastery; the agricultural and industrial museum, the national museum, the memorial house of the national poet Adam Mickiewicz (1798-1855); the Alexander Nevsky cathedral of the Orthodox Greek Church, built in 1854 and following years on the Saxton Square in the Byzantine style, with five gilded cupolas and a detached campanile, 238 ft. high; close beside it, the former palace of the residence of the Polish kings but now used as military administrative offices; the Lutheran church, finished in 1799, one of the most conspicuous in Warsaw; a monument (1811) to the Polish generals who held with Russia in 1840 and were therefore shot by their compatriots, removed to the Zielony Square in 1868; the buildings of the Art Association, opened in 1856, a substantial building; the Republican Theatre (opened 1878); the Palace of the Holy Ghost (1682-1696), with the heart and monument of the musician F. F. Chopin; a monument (1830) to the astronomer N. Kopernicus (1473-1543); the palaces of the families Zamoyski and Staszicowski (now the Polish gallery); the building of the Philharmonic Society (1899-1901); and the church of St Alexander, built in 1826 and splendidly restored in 1891. The Ujazdowska Aleja avenue, planted with lice-trees and bordered with cafes and places of amusement, is the Champs Elysées of Warsaw. It leads to the Lazienki park and to the Belvedere palace (1822), now the summer residence of the governor-general, and farther west to the Podzamcze palace, which is the residence of the Dukes of Warsaw, and west by the manufacturing district. Another principal street, the Marszalkowska, runs parallel to the Ujazdowska from the Saxton garden to this parade ground, on the south-east of which are the royal barracks. Another street, the Ferdynand, is another series running west and east, the chief of them being the Senators, which begins at Sigismund Square and contains the best shops. The palace of the archbishop of Warsaw, the Renaissance (Russian) Bank, formerly the Bank of Poland; the town hall (1725),
burned in 1863, but rebuilt in 1870; the small Pod Blacha palace, now occupied by a chancery; the theatre (1833); the old mint; the beautiful Reformed church (1882); the Orthodox Greek cathedral of the Trinity, rebuilt in 1872; the Palace of the Potocki family, now the Supreme Court; the church of the Transfiguration, a thank-offering by John Sobieski for his victory of 1683, and containing his tomb. The palaces and several palaces are grouped in or near Senators' Street and Miodowa Street.

To the west Senators' Street is continued by Electors' Street, where is the very elegant church (1849) of St Charles Borromeo, and the palace where Prince Wola, who was killed in the battle field where the kings of Poland used to be elected. In Leshno Street, which branches off from Senators' Street, are the Zelazna Bra, or the market-place the bazaar, the arsenal and the Wielopolski barracks.

To the north of Sigismund Square is the old town—Stare Miasto—the Jewish quarter, and farther north still the Alexander citadel. The old town very much recalls old Germany by its narrow streets and antique buildings, the cathedral of St John, the most ancient church in Warsaw, having been built in the 11th century and restored in the 17th. The citadel, erected in 1832-1835 as a punishment for the insurrection of 1831, is of the old type, with six forts too close to the walls of the fortress to be useful in modern warfare. The suburb of Praga, on the right bank of the Vistula, is not poorly built, but has the disadvantage which its position had at the capture in 1794 by the Russians under Suworov, and in 1831 by Paskevich, give it a name in history.

In the outskirts of Warsaw are various more or less noteworthy villages. The beautiful aparments in the palace of the Sobieski, afterwards belonging to Count X. Branicki, was partly built in 1678-1694 by Turkish prisoners in a fine Italian style, and is now renowned for its historical relics, portraits and pictures. It is in the old part of Warsaw, together with the present church of the Franciscan order, built by Prince Stanislaus Lubomirski in 1651, and many other fine villas (Morynneik, Napolin, Krolkornia, which also has a picture gallery, Wierzbno and Motowit). Marymont, an old country residence of the wife of John Sobieski, and the Kaskada, much visited by the inhabitants of Warsaw, in the north, the Sussex Kempa on the right bank of the Vistula, and the castle of Jabłonna down the Vistula towards the Pogoria, are among others that deserve a visit. The castle and forest of Bielany (4 m.), on the bank of the Vistula, are a popular holiday resort in the spring.

On the southern outskirts the nobility of the neighborhood built the palace of Grochow as the residence of the Polish troops were defeated in 1831, and Wawer in the same quarter (E. of Praga), where Prince Joseph Poniatowski defeated the Austrians in the war of 1809; at Maciejowice, 50 m. up the Vistula, Kosciusko was wounded and taken by the Russians in 1794; and 20 m. down the river stands the fortress of Modlin, now Novogrodevich.

History.—The history of Warsaw from the 16th century onwards is intimately connected with that of Poland. The precise date of the foundation of the town is not known; but it is supposed that Conrad, duke of Mazovia, erected a castle on the present site of Warsaw as early as the 9th century. Casimir the Just is supposed to have fortified it in the 11th century, but Warsaw is not mentioned in annals before 1224. Until 1526 it was the residence of the dukes of Mazovia, but when their dynasty became extinct it was annexed to Poland. When Poland and Lithuania were united, Warsaw was chosen as the royal residence. Sigismund Augustus (Wasa) made it (1556) the real capital of Poland, and from 1572 onwards the election of the kings of Poland took place on the field of Wola, on the W. outskirts of the city. From the 17th century possession of it was continually disputed between the Swedes, the Russians, the Brandenburgers and the Austrians. Charles Gustavus of Sweden took it in 1655 and kept it for a year; the Poles retook it in July 1656, but lost it again almost immediately. Augustus II. and Augustus III. did much for its embellishment, but it had much to suffer during the war with Charles XII. of Sweden, who captured it in 1707; but in the following year peace was made, and it became free again. The discussions of charity which followed led to the death of Augustus III, in 1763 opened a field for Russian intrigue, and in 1764 the Russians took possession of the town and secured the election of Stanislaus Poniatowski, which led in 1773 to the first partition of Poland. In November 1794 the Russians took it again, after the bloody assault on Praga, but next year, in the third partition of Poland, Warsaw was given to Prussia. In November 1806 the town was occupied by the troops of Napoleon, and after the peace of Tilsit (1807) was made the capital of the independent duchy of Warsaw; but the Austrians seized it on the 21st of April 1809, and kept possession of it till the 2nd of June, when it once more became independent. The Russians finally took it on the 8th of February 1813. On the 29th of November 1830, Warsaw gave the signal for the unsuccessful insurrection which lasted nearly one year; the city was captured after great bloodshed by Paskevich, on the 7th of September 1831. Deportations on a large scale, executions, and confiscation of the domains of the nobility followed, and until 1856 Warsaw remained under severe military rule.

In 1862 a series of demonstrations began to be made in favour of the independence of Poland, and after a bloody repression a general insurrection broke out. By March 1863, the Russians remaining, however, masters of the situation. Executions, banishment to the convict prisons of Siberia, and confiscation of estates followed. Deportation to Siberia and the interior of Russia was carried out on an unheard-of scale. Scientific societies and high schools were closed; monasteries and nunneries were emptied. Hundreds of Russian officials were called in to fill the administrative posts, and to teach in the schools and the university; the Russian language was made obligatory in all official acts, in all legal proceedings, and even, to a certain extent, in the home. The right of correspondence was expunged from official writings, and, while the old institutions were abolished, the Russian tribunals and administrative institutions were introduced. The serfs were liberated. Much rioting and lawless bloodshed took place in the city in 1905-1906.

WARSAW, a city and the county-seat of Kosciusko county, Indiana, U.S.A., on the Tippecanoe river, about 110 m. E. of Chicago. Pop. (1890) 3,547; (1900) 3,687, including 102 foreign-born; (1910) 4,430. Warsaw is served by the Pittsburg, Fort Wayne and Chicago (Pennsylvania system) and the Cleveland, Cincinnati, Chicago & St Louis railways, and by interurban electric lines. It is picturesquely situated in the lake country of Indiana on Center, Pike and Winona lakes. Immediately E. of the city, on Winona (formerly Eagle) Lake, which is about 2 by 3 m. and has an average depth of 30 ft., is Winona (formerly Spring Fountain) Park (incorporated 1895 largely by Presbyterians), which primarily aims to combine the advantages of Northfield, Massachusetts, and Chautauqua, New York. There is excellent boating and bathing here, and there are mineral springs in the park; when in the summer there are Chautauqua course lasting for six weeks, a normal school, a Bible school, a school of missions, an International Training School for Sunday School Workers, a conference of temperance workers and nature study and other regular summer school courses; and in other months of the year courses are given here by the Winona Normal School and Agricultural Institute, Winona Academy (for boys) and Winona Conservatory of Music, and the Winona Park School for Young Women. The control of the Park is inter-denominational—the Winona Federated Church was organized in 1905. Under practically the same control is the Winona Technical Institute & Chicago (Indiansylvania system) and the Cleveland, Cincinnati, Chicago & St Louis railways, and by interurban electric lines. The surrounding country is devoted to farming and stock raising. Warsaw was first platted in 1856, and became a city in 1875.

WART (Lat. verruca), a papillary excrescence of the skin, or mucous membrane. The ordinary flat warts of the skin occur mostly upon the hands of children and young persons; a long pendulous variety occurs about the chin or neck of delicate children, and on the scalp in adults. Warts are apt to come out in numbers at a time; a crop of them suddenly appears, to disappear after a time with equal suddenness. Hence the suppos- e e' efficiency of charms. A single wart will sometimes remain when the general eruption has vanished. The liability of growths of warts runs in families. In life a wart on the hands or fingers is usually brought on by some irritation, often repeated, even if it be slight. Warts often occur on the wrists and knuckles of slaughter-house men and of those much occupied with ana- tomical dissection; they are often of tuberculous origin (butchers' warts). Chimney-sweeps and workers in coal-tar, petroleum, &c., are subject to warts, which often become cancerous. Warts occur singly in later life on the nose or lips or other parts of the
face, sometimes on the tongue; they are very apt to become malignant. Towards old age broad and flattened patches of warts of a greyish consistence and brownish colour often occur on the back and shoulders. They also are apt to become malignant. Indeed, warts occurring on the lip or tongue, or on any part of the body of a person advanced in life, should be suspected of malignant associations and dealt with accordingly. Venereal warts occur as the result of gonorrhoeal irritation or syphilitic infection.

A wart consists of a delicate framework of blood-vessels supported by fibrous tissue, with a covering of epidermic scales. When the wart is young, the surface is smooth; as it gets older, it becomes rough and projects a little. The head of the wart, whose outgrowth from the surface makes the wart, may be in a cluster of parallel loops, as in the common sessile wart, or the vessels may branch from a single stem, making the long, pendulous warts of the chin and neck. The same kinds of warts also occur on mucous surfaces. It is owing to its vascularity that a wart is liable to come back after being shaved off; the vessels are cut down to the level of the skin, but the blood is still forced into the stem, and the branches are thrown out beyond the surface as before. This fact has a bearing on the treatment of warts; if these are snipped off, the blood-vessels of the stem should be destroyed at the same time by a hot wire or some other caustic, or made to shrivel by an astringent. The same end is served by a gradually tightening ligature (such as a thread of elastic) round the base of the wart. Glacial acetic or carbolic acid may be applied on the end of a glass rod, or by a camel-hair brush, care being taken not to touch the adjoining skin. A solution of perchloride of iron is also effective in the same way. Nitrate of silver is objectionable, owing to the black stains left by it. A simple domestic remedy, often effectual, is the astringent and acid juice of the common stinging nettle, rubbed into the wart, time after time, from the freshly gathered herb.

The result of these various applications is that the wart loses its firmness, shrivels up, and falls off. Malignant and tuberculous warts should be removed by the scalpel or sharp spoon, their bases, if thought advisable, being treated by pure carbolic acid.

A peculiar form of wart, known as verrugas, occurs endemically in the Andes. It is believed to have been one of the causes of the excessive mortality from haemorrhages of the skin among the troops of Pizarro. Attention was called to it by Dr Archibald Smith in 1847; in 1874, during the making of the Trans-Andean railway, it caused considerable loss of life among English navvies and engineers. (E. O.)

WARTBURG, THE, a castle near Eisenach in the grand-duchy of Saxe-Weimar. It is magnificently situated on the top of a precipitous hill, and is remarkable not only for its historical associations but as containing one of the few well-preserved Romanesque palaces in existence. The original castle, of which some parts—including a portion of the above-mentioned palace (Landgrafenhaus)—still exist, was built by the landgrave Louis I (the Springer) (d. 1233), and from his time until 1440 it remained the seat of the Thuringian landgraves. Under the landgrave Hermann I., the Wartburg was the home of a boisterous court to which minstrels and "wandering folk" of all descriptions streamed; and it was here that in 1207 took place the minstrels' contest (Sängerkrieg) immortalized in Wagner's Tannhäuser. Some years later it became the home of the saintly Elizabeth of Hungary (q.v.) on her marriage to Louis the Saint (d. 1227), to whom she was betrothed in 1211 at the age of four. It was to the Wartburg, too, that on the 4th of May 1521, Luther was brought for safety at the instance of Frederick the Wise, elector of Saxony, and it was during his ten months' residence here (under the inscrito de Junker Jörg) that he completed his translation of the New Testament.

From this time the castle was allowed gradually to decay. It was restored in the 18th century in the questionable taste of

1 Walther von der Vogelweide (ed. F. Pfeiffer 1880, No. 99) and Wolfram von Eschenbach (Parzival vi. 226 and Willehalm iv. 26) both refer to the notion of constant crush of crowds passing in and out at the Wartburg "night and day."

2 Wagner, with a poet's licence, has placed the Sängerkrieg during Elizabeth's residence at the Wartburg.

the period; but its present magnificence it owes to the grand-duke Charles Alexander of Saxe-Weimar, with whom at certain seasons of the year it was a favourite residence. The most interesting part of the castle is the Romanesque Landgrafenhaus. This, besides a chapel, contains two magnificent halls known as the Sängersaal (hall of the minstrels)—in which Wagner placed the setting of his memorable First Act of his celebrated four-post bed Sängersaal is decorated with a fine fresco, representing the minstrels' contest, by Moritz von Schwind, who also executed the frescoes in other parts of the building illustrating the legends of St Elizabeth and of the founding of the castle by Louis the Springer. The Festsaal has frescoes illustrating the triumphs of Christianity, by Weler. In the buildings of the outer court of the castle is the room once occupied by Luther, containing a much mutilated four-post bed and other relics of the reformer. The famous blot caused by Luther's hurling his ink-pot at the devil has long since become a mere hole in the wall, owing— it is said—to the passion of American tourists for souvenirs.

The armoury (Rüstkammer) contains a fine collection of armour, including suits formerly belonging to Henry II. of France, the elector Frederick the Wise and Pope Julius II. The great watch-tower of the castle commands a magnificent view of the Thuringian forest on the one side and the plain on the other.

WARTHE (Polish, Warta), a river of Poland and Germany, and the chief affluent of the Oder. It rises on the north slope of the Carpathian Mountains N.W. of Cracow, flows north as far as Krakow, where it bends west, and then curves south and reaches Kola, where it again turns west, crosses the frontier into the Prussian province of Posen, where it takes a northerly direction past the town of Posen. Then once more bending west, it flows past Schwerin and Landsberg and enters the Oder from the right at Custrin. Its total length is 445 m. of which 215 are in Poland and 230 in Prussia; it is navigable up to Konin in West Poland, a distance of 265 m. Its banks are mostly low and flat, its lower course especially running through drained and cultivated marshes. It is connected with the Vistula through its tributary the Nidzica and the Bromberg canal. The area of its drainage basin is 17,400 sq. m.

WART-HOG, the designation of certain hideous African wild swine (see SWINE), characterized by the presence of large warty protuberances on the face, the large size of the tusks in both sexes, especially the upper pair, which are larger and stouter than the lower ones and are not worn at their summits, and the complexity and great size of the last pair of molar teeth in each jaw. The adults have frequently no teeth except those just mentioned, and nearly bare skins; and the young are uniformly coloured. Two species are thus named. The southern Phacochoerus aethiopicus, which formerly ranged as far south as the Cape, and the northern P. africanus, which extends to the mountains of Abyssinia, where it has been found at a high elevation. In South and East Africa wart-hogs frequent more or less open country, near water, and dwell in holes, generally those of the aard-vark. In Abyssinia, on the other hand, they spend the day among bushes, or in ravines, feeding at night.

WARTON, JOSEPH (1722-1800), English critic and poet, eldest son of Thomas Warton (see below), was baptized at Dunsfold, Surrey, on the 22nd of April 1722, and entered Winchester school on the foundation of 1738. William Collins was already there, and the two formed a friendship which was maintained through their Oxford career. They read Milton and Spenser together, and wrote verses, which, published in the Gentleman's Magazine, attracted the attention of Dr Johnson. Warton went to Oriel College, Oxford, in 1740, and took his B.A. degree in 1744. He took holy orders, and during his father's lifetime acted as his curate at Basingstoke. He then went to Chelsea, London; but eventually returned to Basingstoke. He married, became rector of Winalde (1748), of Tunworth (1754), in 1755 he was appointed a sub-dean of Salisbury, and served that diocese in 1766. He was not a successful schoolmaster, and when the boys mutinied against him for the third time he wisely resigned his position (1793).

His leisure was devoted to literature. Warton was far from having the genius of Collins, but they were at one in their impatience under the prevailing taste for moral and ethical poetry. Whoever wishes to understand how early the reaction against Pope's style began should read Warton's The Enthusiast,
or The Lover of Nature, and remember that it was printed in 1744, the year of Pope's death. "As he is convinced," he wrote in the preface (1746) to his Odes printed in Oxford, "that the fashion of moralizing in verse has been carried too far, and as he looks upon invention and imagination to be the chief faculties of a poet, so he will be happy if the following odes may be looked upon as an attempt to bring back poetry into its right channel." He published an edition (1753) in Latin and English of Virgil. This contained Christopher Pitt's version of the Aeneid, his own rendering of the Elegories and Georgics in the heroic measure, and essays by Warburton and others. Warton himself appended essays on epic and didactic poetry, a life of Virgil and an account of the "noble" life of Dr John Donne and wrote papers on Shakespeare and Homer in The Adventurer; and in 1757 he published the first part of an Essay on the Genius and Writings of Pope, an essay regarded at the time as revolutionary, by Johnson at least, because it put Pope in the second rank to Shakespeare, Spenser and Milton, on the ground that moral and ethical poetry, however excellent, is an inferior species. He held his own against Johnson in the Literary Club; and after enduring many jests about the promised second part of the essay and the delay in its appearance, published it at last, retracting nothing, in 1782. Warton's edition of Pope was published in 1759-1763, and a second edition, long delayed, was completed and published by his son in 1811. Warton was a prebendary of St Paul's and of Winchester Cathedrals, and held the livings of Upham and of Wickham, Hampshire, where he died on the 23rd of February 1800.

See Biographical Memoirs of the Late Rev. Joseph Warton, by John Woolf (vol. i., 1806, no more published).

WARTON, THOMAS (c. 1688-1745), English author; professor of poetry at Oxford, son of Anthony Warton, was born at Godalming about 1688. He was educated at Hart Hall and Magdalen College, Oxford, and was satirized in one of his verses by Nicholas Amhurst in Terrae flatus as "squinting Tom of Mauldin." He was vicar of Basingstoke, Hampshire, and master of the grammar-school of the town, where he had among his pupils Gilbert White, the naturalist. He received further preferments in the church, and died at Basingstoke on the 10th of September 1745. He published nothing during his lifetime, but after his death his son Joseph published some of his poetry under the title of Poems on Several Occasions (1748).

WATSON, Thomas (1728-1790), English poet-laureate and historian of poetry, younger son of Thomas Warton (see above), was born at Basingstoke on the 9th of January 1728. He was still more precocious as a poet than his brother—translated one of Martial's epigrams at nine, and wrote The Pleasures of Molendony at seventeen—and he showed exactly the same bent, Milton and Spenser being his favourite poets, though he "did not fail to cultivate his mind with the soft thrillings of the tragic muse" of Shakespeare.

In a poem written in 1745 he shows the delight in Gothic churches and ruined castles which inspired so much of his subsequent work in romantic revival. Most of his best verse is humorous and serious—and the humorous mock-heroic was better within his powers than serious verse—was written before the age of twenty-three, when he took his M.A. degree and became a fellow of his college (Trinity, Oxford). He did not altogether abandon verse; his sonnets, especially, which are the best of his poems, were written later. But his main energies were given to omnivorous poetical reading and criticism. He was the first to turn to literary account the medieval treasures of the Bodleian Library. It was through him, in fact, that the medal in the edition of 1746 was furnished to Oxford first materials, still in its inaction, and to claim an influence in the modern world. Warton, like his brother, entered the church, and held one after another, various livings, but he did not marry. He gave little attention to his clerical duties, and Oxford always remained his home. In 1749 he published an heroic poem in praise of Oxford, The Triumph of Isis. He was a very convivial as well as a very learned don, with a taste for pothouses and crowds, as well as dim aisles and romances in manuscript and black letter. The first proof that he gave of his scholarly interest was his Observations on the Poetry of Spenser (1754). Three years later he was appointed professor of poetry, and held the office for ten years, sending round, according to the story, at the beginning of term to inquire whether anybody wished him to lecture. The first volume of his monumental work, The History of English Poetry, appeared twenty years later, in 1774, the second volume in 1778, and the third in 1781. A work of such enormous labour and research could proceed but slowly, and it was no wonder that Warton flagged in the execution of it, and stopped to refresh himself by annotating (1785) the minor poems of Milton, pouring out in this delightful work the accumulated suggestions of forty years.

In 1783 he became Camden professor of history, and was made poet-laureate in the same year. Among his minor works were an edition of Theocritus, a selection of Latin and Greek inscriptions, the humorous Oxford Companion to the Guide and Guide to the Companion (1763); The Oxford Sausage (1764); an edition of Theocritus (1770); lives of Sir Thomas Pope and Ralph Bathurst, college benefactors; A History of the Antiquities of Kidington Parish, of which he held the living (1781); and An Introduction to the Study of the Poems attributed to Thomas Rowley (1782). His busy and convivial life was ended by a paralytic stroke in May 1790.

Warton's poems were first collected in 1777, and he was engaged at the time of his death on a corrected edition, which appeared in 1791, with a memoir by his friend and admirer, Richard Mant. They were first printed in the British Poets, by S. W. Singer. The History of English Poetry from the close of the 11th to the Commencement of the 18th Century, to which are prefixed two Dissertations: I. On the Origin of Romanick Poetry in England. II. On introducing English Poetry from the close of the 11th to the close of the 16th century. It was criticized by J. Ritson in 1782 in A Familiar Letter to the Author. A new edition came out in 1823, with an elaborate index and an appendix by the editor, who added to the text comments and emendations from Joseph Ritson, Francis Douce, George Ashby, Thomas Park and himself. Another edition of this, stated to be "further improved by the corrections and additions of several eminent antiquaries," appeared in 1840. In 1871 the book was subjected to a radical revision by Mr W. C. Hadlitt. He cut out passages in which Warton had been led into gross errors by misreading his authorities or relying on false information, and supplied with brackets information on authors or works omitted. Warton's matter, which was somewhat scattered, although he worked on a chronological plan, was in some cases revised by the modern editor, but much of the plan was cut down, although new information was added by the editor and his associates, Sir Frederick Madden, Thomas Wright, W. Aldis Wright, W. W. Skeat, Richard Morris and F. J. Furnivall. When the work has been before the world it has been regarded as a valuable work, and the unsatisfactory nature of his general plan, the fact remains that his book is still indispensable to the student of English poetry. Moreover, much that may seem commonplace in his criticisms is entirely fresh and even revolutionary in his own day. Warton directed the attention of readers to early English literature, and in, view of the want of texts, rendered inestimable service by transcribing large extracts from early writers. Of the poets of the 16th century he was an extremely sympathetic critic and has not been superseded.

See J. Warton and Machyn's Diary, by H. E. D. Blakiston in the English Historical Review (April 1896) for illustrations of his inaccurate methods.

WARWICK, EARLS OF. John Rous (c. 1411-1491), the historian of the earls of Warwick, gives an account of them from Brutus their founder through many mythical ancestors, among whom is the Guy of romance. The 1st earl of Warwick was Henry de Newburgh (d. 1123), lord of Newburgh in Normandy and son of Roger de Beaumont. He became constable of Warwick Castle in 1115, and through the false proof that he and Henry de Beaumont, comte de Meulan, fought at Hastings. He apparently spent most of his time in Normandy, and was a baron of the Norman exchequer. He was created earl of Warwick early in the reign of William II. receiving a grant of the great estates of the Saxon, Thurkill of Arden, in Warwickshire. He was attached throughout his life to Henry I., and both the Beaumont brothers were faithful to the king at the time of the
conspiracy of the Norman noble in 1101. By his wife Margaret, daughter of Geoffrey II, count of Perche, he had five sons and two daughters. He died on the 2oth of June 1123, and was buried in the Norman abbey of Préaux, near Pont-Audemer, a family foundation of which he and his brother were patrons. At Warwick he founded the priory of the Austin Canons, and endowed the church of St Mary.

Of his sons Roger de Newburgh became 2nd earl of Warwick and died in 1153; Rotrou (d. 1190) became archbishop of Rouen; and Robert, seneschal and justiciar of Normandy, died in 1185 in the abbey of Bec, of which he was a benefactor. The estates of Warwick were inherited by his brother William II (d. 1184) and Walader (d. 1204). Henry de Newburgh, 5th earl of Warwick (1192-1229), took the royal side in the civil wars of the reigns of John and Henry III. The 6th earl, Thomas de Newburgh (c. 1213-1297), left no heirs, and was succeeded by his sister Margaret, countess of Warwick in her own right, who was twice married, but left no heirs. Her second husband, John du Plessis, assumed the title of earl of Warwick in 1245, and in 1256 received a grant of his wife's lands for life. He was succeeded in 1263 by Countess Margaret's cousin and heir Sir William de Beauchamp (c. 1220-1270), 1st earl of Warwick. Mauduit's sister and heiress, Isabel de Beauchamp, had apparently adopted the religious life at the time of her brother's death, and her son William de Beauchamp became 9th earl of Warwick.

His son Guy de Beauchamp, 10th earl of Warwick (1278-1315), received grants of land in Scotland for his services at Falkirk, and in 1301 was one of the signatories of the letter to the pope denying the papal right to interfere in Scottish affairs. He was with Edward I. at the time of his death, and is said to have been warned by him against Piers Gaveston. He was one of the lords ordainers of 1310, and was concerned in the capture of Gaveston, though he declined to countenance his execution. He died on the 10th of August 1315. His son, Thomas de Beauchamp, 11th earl (1313-1360), was marshal of England in 1344, and of the English army in France in 1346. He fought at Crecy and Poitiers, and was one of the original knights of the Garter.

Thomas de Beauchamp, 12th earl (c. 1345-1401), was about twenty-four years old when he succeeded his father. He served on the lords' committee of reform in the Good Parliament in 1376, and again in 1377, and was a member of the commission of inquire in 1379. Appointed governor to Richard II. in February 1381, he joined the nobles who sought to impose their authority on the king, and was one of the lords appellant in 1388. After the overthrow of his party in 1389 Warwick lived in retirement, but although he had for the moment escaped Richard's vengeance he was not forgiven. Being invited with Gloucester and Arundel to a banquet at court on the 10th of July 1397 he alone of the three was imprudent enough to obey the summons. He was immediately arrested and imprisoned in the Tower of London, in that part of the fortress since known as the Beauchamp Tower. Warwick made a full confession in parliament; his honours were forfeited and he himself banished. He was again in the Tower in 1398, but was liberated and restored to his honours on the accession of Henry IV. His son Richard Beauchamp, 13th earl of Warwick, is separately noticed.

Henry, 14th earl of Warwick (1423-1449), Earl Richard's son, a descendant, through his mother Constence le Despenser, of Edmund, duke of York, fifth son of Edward III., received a patent making him premier earl in 1444. A year later he was created duke of Warwick with precedence next after the Duke of Norfolk. He was created by his brother Duke of Buckingham. The assertion that he was crowned king of the Isle of Wight seems to have no foundation in fact. The 14th earl, whose honours were probably due to his father's services, died in his twenty-second year, leaving a daughter Anne, who died in 1440. On her death the earldom lapsed to the crown. The estates passed to Sir Richard Neville (see Warwick, Richard Neville, earl of), right of his wife Anne, sister of Henry Beauchamp, duke of Warwick. He and his wife were created earl and countess of Warwick each for life in 1450, with remainder to Anne's heirs, and, these failing, to Margaret, countess of Shrewsbury, half-sister of the countess Anne. After the death of her husband, the Kingmaker, at Barnet in 1471, the rights of the countess, heiress of the Beauchamp estates, were set aside "as if the said countess were nowe naturally dade" (act of 13 Edward IV. 1473) in favour of her daughters, Isabel, wife of George, duke of Clarence, and Anne, who, after the murder of her first husband Edward prince of Wales in 1471, married Richard, duke of Gloucester, afterwards Richard III. Their mother was allowed to resume her estates in 1485, but only to settle them on the crown. She was succeeded in 1493 in the earldom by her grandson Edward (c. 1475-1494), 7th earl of Warwick, son of the duke of Clarence, and therefore the Yorkists took to the crown. He was imprisoned in 1484, his sole offence being his birth, and was executed in 1499 on a charge of conspiracy with his fellow-prisoner, Perkin Warbeck. He was the last representative of the male line of the Plantagenets. His honours were forfeited, and his estates passed to his sister Margaret, countess of Salisbury in her own right, the unfortunate lady who was executed in 1541.

The next bearer of the title was John Dudley, Viscount Lisle, afterwards duke of Northumberland (q.v.), who was created earl of Warwick in 1547, on account of his descent from Margaret, countess of Shrewsbury, daughter of Richard Beauchamp, earl of Warwick. The earldom became extinct with his son John Dudley, 20th earl of Warwick (c. 1528-1554), who was condemned to death for having signed the letters patent making his sister-in-law, Lady Jane Grey, heir apparent. He was released from prison in October 1554, but died in the same month. His brother, Ambrose Dudley (c. 1528-1590), who fought at St Quentin in 1557, secured the reversal of the attainder of himself and his brother consequent on the attempt to place Lady Jane Grey on the throne, and in 1561 was created Baron Lisle and earl of Warwick. He was in high favour with Elizabeth, as was his third wife Anne, daughter of Francis Russell, 2nd earl of Bedford. His brother Robert, earl of Leicester, having predeceased him his honours became extinct on his death in 1590.

The earldom was revived in 1618 in favour of Robert Rich, 3rd Baron Rich (c. 1560-1610), grandson of Lord Chancellor Rich, who died shortly after his elevation. His wife Penelope, Lady Rich, is separately noticed. He was succeeded in 1619 by his eldest son Robert Rich, 2nd or 3rd earl of Warwick (q.v.), whose two sons Robert (1611-1650) and Charles (1619-1673) succeeded him in the earldom and died leaving no male issue. The 5th or 26th earl of Warwick was their cousin Robert Rich (1620-1672), eldest son of Henry, 1st earl of Holland. His grandson, the 7th or 28th earl, left no issue, and the title became extinct on the death, on the 5th of September 1759, of his kinsman Edward Rich, 8th or 29th earl. It was revived two months later, when Francis Greville, Baron Brooke of Beauchamps Court (1719-1773), who had in 1746 been created Earl Brooke of Warwick Castle, became earl of Warwick. Greville was descended from Robert Greville, the 2nd baron, who was killed at Lichfield during the civil war and he represented a cadet branch of the Beauchamp family. His son George (1746-1816) became the 2nd earl of this line, and the earldom has remained with his descendants, Francis Richard (b. 1853) becoming the 5th earl in 1803. His wife, Frances Evelyn, countess of Warwick, daughter of Colonel the Hon. C. H. Maynard (d. 1865), inherited the estates of her grandfather, Henry Maynard, 5th and last Viscount Maynard (1788-1865). She became well known in society later and was known as Lady Maynard of Warwick. She died in 1880.

WARWICK, SIR PHILIP (1600-1653), English writer and politician, was the son of Thomas Warwick, or Warrick, a musician, and was born in Westminster on the 24th of December 1600. Educated at Eton, he travelled abroad for some time and in 1636 became secretary to the lord high treasurer, William Juxon; later he was a member of the Long Parliament, being one of those who voted against the attainer of Strafford and who followed Charles I. to Oxford. He fought at Edgehill and was one of the King's secretaries during the negotiations with the
parliament at Hampton Court, and also during those at Newport, Charles speaking very highly of his services just before his execution. Remaining in England, Warwick was passively loyal to Charles II. during the Commonwealth and enjoyed the confidence of the royalist leaders. In 1660 the king made him a knight, and in 1661 he became a member of parliament and secretary, and represented Warwicke, Townsend, Holwell, Earle of Southampton, retaining this post until the treasury was put into commission on Southampton's death in May 1667. He died on the 15th of January 1683. Warwick's only son, the younger Philip Warwick (d. 1683), was evoked to Sweden in 1680.  

Warwick is chiefly known for his Memoirs of the reign of King Charles II. with a continuation to the happy restoration of King Charles II., written between 1675 and 1676 and published in London in 1701.  

WARWICK, RICHARD NEVILLE, EARL OF (1428-1471), called "the king-maker," was eldest son of Richard Neville, earl of Salisbury, by Alice, one daughter and heirress of Thomas, the last Montacute earl of Salisbury. He was born in the second week of November 1428, and whilst still a boy betrothed to Anne, daughter of Richard Beauchamp, earl of Warwick. When her brother's daughter died in 1449, Anne, as only sister of the whole blood, brought her husband the title and chief share of the Warwick estates. Richard Neville thus became the premier earl, and both in power and position excelled his father. Richard, duke of York, was his uncle, so when York became protector in 1453, and Salisbury was made chancellor, it was natural that Warwick should be of the council. After the king's recovery in 1455 Warwick and his father took York's support. Their victory at St Albans on the 22nd of May 1459 was due to the fierce energy with which Warwick assaulted and broke the Lancastrian centre. He was rewarded with the important office of captain of Calais; to his position there he owed his strength during the next five years. Even when York was displaced at home, Warwick retained his post, and in 1457 he was also made admiral. He was present in February 1458 at the professed reconciliation of the two parties in a lovefeast at St Paul's, London. During the previous year he had done some good fighting on the march of Calais by land, and kept the French with vigour; now on his return he distinguished himself in a great fight with Spanish ships off Calais on the 28th of May, and in the autumn by capturing a German salt-ship on its way to Lübeck. These exploits brought him a prestige and popularity that were distasteful to the home government. Moreover, England was at war neither with Castile nor with the Hanse. Warwick's action may possibly have formed part of some Yorkist design for frustrating the foreign policy of their rivals. At all events there was pretext enough for recalling him to make his defence. Whilst he was at the Court at Westminster, some difficulty occurred between his retainers and some of the royal household. Warwick himself escaped with difficulty, and went back to Calais, alleging that his life had been deliberately attempted. When in the following year a renewal of the war was imminent, Warwick crossed over to England with his trained soldiers from Calais under Sir Andrew Trollope. But at Ludlow on the 12th of October Trollope and his men deserted, and left the Yorkists helpless. Warwick, with his father, his cousin the young Edward of York, and only three followers, made his way to Barnstaple. There they hired a little fishing vessel. The master pleaded that he did not know the Channel, but Warwick resourcefully took command and himself steered a successful course to Calais. He arrived just in time to anticipate the duke of Somerset, whom the Lancastrians had sent to supersede him. During the winter Warwick held Calais against Somerset, and sent out a fleet which seized Sandwich and captured Lord Rivers. In the spring he went to Ireland to concert plans with Richard of York. On his return voyage he encountered a superior Lancastrian fleet in the Channel. But Exeter, the rival commander, could not trust his crews and dared not fight.  

From Calais Warwick, Salisbury and Edward of York crossed to Sandwich on the 26th of June. A few days later they entered London, whence Warwick at once marched north. On the 10th of July they routed the Lancastrians at Northampton, and took the king prisoner. For the order to spare the commons and slay the lords Warwick was responsible, as also for some later executions at London. Yet when Richard of York was disposed to claim the crown, it was, according to Warrin, Warwick who decided the discussion in favour of a compromise, perhaps from loyalty to Henry, or perhaps from the wish not to change a weak sovereign for a strong. Warwick was in charge of London at the
time when Richard and Salisbury were defeated and slain at Wakefield. The Lancastrians won a second victory at St Albans on the 17th of February 1461, possibly through lack of generalship on Warwick's part. But in his plans to retrieve the disaster, Warwick showed skill and decision. He met Edward of York in Oxfordshire, brought him in triumph to London, had him proclaimed king, and within a month of his defeat at St Albans was marching north in pursuit of the Lancastrians. The good generalship which won the victory of Towton may have been due to Edward rather than to Warwick, but the new king was of the creation of the powerful earl, who now had his reward. For four years the government was centred undisputedly in the hands of Warwick and his friends. The energy of his brother John, Lord Montagu, frustrated the various attempts of the Lancastrians in the north. In another sphere Warwick himself was determining the lines of English policy on the basis of an alliance with France. The power of the Nevilles seemed to be completed by the promotion of the Overthrow of the Woodvilles, and he was appointed archbishop of York. The first check came with the announcement in September 1463 of the king's secret marriage to Elizabeth Woodville. This was particularly distasteful to Warwick, who had but just pledged Edward to a French match. For the time being, however, there was no open breach. The trouble began in 1466, when Edward first made Rivers, the queen's father, treasurer, and afterwards threw obstacles in the way of an intended marriage between Warwick's daughter Isabel and George of Clarence, his own next brother. Still in May 1469 Warwick went again with the king's assent to conclude a treaty with France. He returned for But now it is abundantly clear that Edward, under the influence, had committed himself definitely to the Burgundian alliance. Warwick retired in dudgeon to his estates, and began to plot in secret for his revenge. In the summer of 1469 he went over to Calais, where Isabel and Clarence were married without the king's knowledge. Meantime he had stirred up the rebellion of Robin of Redesdale in Yorkshire; and when Edward was drawn north, Warwick invaded England in arms. The king, outmatched and outnumbered, had to yield himself prisoner, whilst Rivers and his son John were executed. Warwick was appointed protector with the Overthrow of the Woodvilles, and believed that he had secured Edward's submission. In March 1470 a rebellion in Lincolnshire gave Edward an opportunity to gather an army of his own. When the king alleged that he had found proof of Warwick's complicity, the earl, taken by surprise, fled with Clarence to France. There, through the instrumentality of Louis XI., he was with some difficulty reconciled to Margaret of Anjou, and agreed to marry his second daughter to her son. In September Warwick and Clarence, with the Lancastrian lords, landed at Dartmouth. Edward in his turn had to fly overseas, and for six months Warwick ruled England. He was deposed by the queen mother, and Henry VI., who was restored from the prison in the Tower to a nominal throne. But the Lancastrian restoration was unwelcome to Clarence, who began to intrigue with his brother. When in March 1471 Edward landed at Ravenspur, Clarence found an opportunity to join him. Warwick was completely outgeneraled, and at Barnet on the 14th of April was defeated and slain.

Warwick has been made famous by Lytton as "The Last of the Barons." The title suits him as a great feudal lord, who was a good fighter but a poor general, who had more sympathy with the order than with the new culture. But he was more than this. He had some of the qualities of a strong ruler, and the power to command popularity. He was a skilled diplomatist and an adroit politician. These qualities, with his position as the head of a great family, the chief representative of Beauchamp, Despenser, Montacute and Neville, made him during ten years "the king-maker."

Warwick's only children were his two daughters. Anne, the younger, was married after his death to Richard of Gloucester, the future Richard III. Their husbands shared his inheritance and squabbled over its division.

BIBLIOGRAPHY.—Warwick of course fills a great place in contemporary authorities, for a note on the chief of them see under Edward IV. For modern authorities see especially C. W. Oman's brilliant but enthusiastic Warwick the King-Maker, Sir John Ramsay's Lancaster and York, and Stubbs's Constitutional History.

(C. L. K.)

WARWICK, SIR ROBERT RICH, 2ND EARL OF (1587–1638), colonial administrator and admiral, was the eldest son of Robert Rich, earl of Warwick (see above) and his wife Penelope Rich (q.v.), and succeeded to the title in 1610. Early interested in colonial ventures, he joined the Bermudas, Guinea, New England and Virginia companies. His enterprises involved him in disputes with the East India Company (1617) and with the Virginia Company, which in 1624 was suppressed through his action. In 1627 he commanded an unsuccessful privateering expedition against the Spaniards. His Puritan connexions and sympathies, while gradually estranging him from the court, promoted his association with the New England colonies. In 1628 he indirectly procured the patent for the Massachusetts colony, and in 1630, when he secured the "Saybrook" patent in Connecticut. Compelled the same year to resign the presidency of the New England Company, he continued to manage the Bermudas and Providence Companies, the latter of which, founded in 1636, administered Old Providence on the Mosquito coast. Meanwhile in England Warwick opposed the forced loan of 1626, the payment of ship-money and Laud's church policy, and with his brother the first lord Holland (q.v.) came to be recognized as one of the heads of the Puritans. In March 1642 the Commons, in spite of the king's veto, appointed him admiral of the fleet, and in July he gained the whole navy for the parliament. He raised a fleet in Norfolk and Essex on the outbreak of the war, and in 1649, when appointed lord high admiral (1643–1645) he did good service in intercepting the king's ships and relieving threatened ports. In 1643 he was appointed head of a commission for the government of the colonies, which the next year incorporated Providence Plantations, afterwards Rhode Island, and in this capacity he exerted himself to secure religious liberty. Reappointed lord high admiral in May 1648, in the vain hope that his influence with the sailors would win back the nine ships which had revolted to the king, he collected a new fleet and blockaded them at Helvoetsluys. Dismissed from office on the abolition of the House of Lords in 1649, he retired from public life, but was intimately associated with Cromwell, whose daughter Frances married his grandson and heir Robert Rich in 1657. He died on the 14th of April 1658. The suspicions cast by his enemies on his religious sincerity and political fidelity appear to be baseless.

WARWICK, a town of Merivale county, Queensland, Australia, 169 m. by rail S.W. of Brisbane. Pop. (1901) 3550. It lies on the bank of the river Contadamine, in the heart of one of the best agricultural districts in Queensland, and is perhaps the most fruitful of all the sugar-growing areas, and is well laid out with many substantial public and private buildings, and has two large parks, besides smaller recreation grounds. The district is famous for its vineyards, and quantities of excellent wine are made; wheat and maize are the principal crops, but tobacco, oats and lucerne are largely grown. Coal is found near the town, as are also marble, good building stone and brick clay.

WARWICK, a municipal and parliamentary borough, and the county town of Warwickshire, England; finely situated on the river Avon, the Warwick & Nantwich and Birmingham canals, 95 m. N.W. from London. Pop. (1901) 11,889. It is served by the Great Western and the London & North Western railways. The parliamentary borough was united with that of Leamington in 1885, and returns one member. Leaming- ton lies 2 m. E., and the towns are united by the suburb of New Milverton.

The magnificent castle of the earls of Warwick stands in a commanding and picturesque position on a rocky eminence above the river. Its walls, enclosing a lovely lawn and gardens, are flanked by towers, of which Caesar's tower, 147 ft. high, the Gateway tower and Guy's tower are the chief, dating from the 15th century. The residential portion lies on the river side. Excepting a few traces of earlier work, its appearance is that of a princely mansion of the 17th century. There is
WARWICK—WARWICKSHIRE 341

a famous collection of pictures. The Great Hall and other apartments suffered from fire in 1871, but were restored. A vase of marble attributed to the 4th century A.D. is preserved here; it was discovered near Hadrian's Villa at Tivoli in Italy. Below the castle the Avon, with thickly wooded banks, affords one of the most exquisite reaches of river scenery in England. The church of St Mary is principally, as it stands, a rebuilding of the time of Queen Anne, after a fire in 1694. It appears from Domesday that a church existed before the Conquest. It was made collegiate by Roger de Newburgh, the second Norman earl, in 1123. At the Dissolution Henry VIII. granted the manors and burgesses of the town. The Beauchamp Chapel survived the fire; it is a beautiful example of Perpendicular work, founded by the will of Earl Richard Beauchamp, and built between 1443 and 1454. The fine tomb of the earl stands in the centre. There are only scanty traces of the old town walls, but the east and west gates remain, rendered picturesque by chapels built above them. The priory of St Sepulchre was founded by Henry de Newburgh and completed in the reign of Henry I., on the site of an ancient church, for a society of canons regular. It is now a private residence. Leicester Hospital, established by Bishop John of Conisbrough in 1130, preserved an pile of half-timber building. It was originally used as the hall of the united gilds of the Holy Trinity, the Blessed Virgin and St George the Martyr. The earl of Leicester, by an act of incorporation obtained in 1571, founded the hospital for the reception of twelve poor men possessing not more than £5 a year, and a master. The first master, appointed by the earl himself, was the famous Puritan, Thomas Cartwright. St John's Hospital, a foundation of the time of Henry II., is represented by a beautiful Jacobean mansion. There are numerous charities in the town, the principal being those of Henry VIII., Sir Thomas White and Thomas Oken. The first is devoted to ecclesiastical and municipal stipends and to the King's School. By the charity of Sir Thomas White, the sum of £100 is lent, without interest, to young tradesmen for a period of nine years. The King's School, an important foundation for boys, dates from the reign of Edward the Confessor. It occupies modern buildings. Upon the same foundation are the high school for girls and the King's middle school. Among public buildings are a shire hall, free library and museum. Industries include gelatine and brick-making, and there are ironworks. The parliamentary borough returns one member. Area, 1076 acres.

A famous site in the vicinity of Warwick is Guy's Cliffe, where a modern mansion, embodying ancient remains, crowns the precipitous rocky bank of the Avon. Here was the hermitage of the first Guy, earl of Warwick. Blacklow Hill in the vicinity was the scene of the execution of Piers Gaveston, the favourite courtier of Edward II., in 1312.

Warwick (Warwick, Warwicki, Warrewyke) is said to have been a Roman station, and was later fortified by Ethelfleda, the lady of Mercia, against the Danes. At the time of the Domesday Survey, Warwick was the royal borough, containing 261 houses, of which 130 were in the king's hands, while 10 belonged to burgesses who enjoyed all the privileges they had in the time of Edward the Confessor. The Conqueror granted the borough to Henry of Newburgh, who was created earl of Warwick, and in all probability built the castle on the site of Ethelfleda's fortification. The Beauchamps, successors of Henry of Newburgh as earls of Warwick, held the borough of the king in chief. Although the borough owed its early importance to the castle of the earls of Warwick as well as to its position and site, the right of a fair from John earl of Warwick, in 1261, it seems to have developed independently of them, and received no charter until it was incorporated under the title of the burgesses of Warwick in 1546 after it had come into the king's hands by the attainder of Edward, earl of Warwick, in 1490. Other charters were granted in 1553, 1665, 1684 and 1694, of which that of 1553 allowed the appointment of assistant burgesses, though this was discontinued in 1698 because through their means a candidate for the borough was elected not supported by the recorder and aldermen. The charter of 1694 conferred the title of "Mayor, Aldermen and Burgesses" on the corporation, and appointed the offices of the borough. The mayor, aldermen and assistant burgesses were to assemble yearly at Michaelmas, and in the presence of all the burgesses nominate two aldermen, who should elect the new mayor and other officers. A mayor refusing office was to be fined £20, an alderman £10 and an assistant burgess £5. In 1882 the borough was divided into three wards, and the corporation consists of a mayor, 6 aldermen and 18 town councillors. Warwick returned two members to parliament from 1295, but in 1885 the number was reduced to one. A grant to a fair granted by the earl, to the burgesses in 1261, he himself held by prescriptive right a yearly fair in August and a market every Wednesday. Another fair was granted in 1290, and in 1413 the fair held at Michaelmas was changed to the feast of St Bartholomew. Fairs are now held on the 12th of October and on the Monday before St Thomas's day. A market is held every Saturday, the first charter for this being granted in 1545. A goal is mentioned here as early as 1200 in a pipe roll of that year.

Warwick, a township of Kent county, Rhode Island, U.S.A., and part of Providence proper. It is on the W. side of Narragansett Bay (here called Providence river) and crossed by the Pawtuxet river, which is in its lower course a part of the township's northern boundary. Pop. (1890) 17,261; (1900) 21,316, of whom 7702 were foreign-born; (1910 census) 26,620. The township is crossed by the New York, New Haven & Hartford railway, and electric lines serve most of its twenty-seven rather scattered villages. The larger villages are: on the river, Pontic, Natick, River Point (at the junction of the two upper branches of the Pawtuxet), Phoenix, Centreville and Crompton; on Greenwich Bay, Apponaug and Warwick; and on Providence river, Shawomet, Warwick Neck, Oak Hill Beach, Buttonwoods, Cominicut and Long Meadow, which are summer resorts. Water power is provided by the Pawtuxet river, and much cotton and some woolen and print goods are manufactured. The value of the factory product in 1905 was $7,051,971 (17.1% more than in 1900); of the total, nine-tenths was the value of textile products. Warwick, originally called Shawomet (Shawmut), its Indian name, was settled in 1634 by Samuel Gorton (g.) and a few followers. Gorton quarrelled with the Indians, was carried off to Boston, was tried there for heresy, was convicted, and imprisoned; was released with orders to leave the colony in March 1644, went to England, and under the patronage of the earl of Warwick returned to his settlement in 1648 and renamed it in honour of the earl. In 1647 the settlement entered into a union with Providence, Newport and Portsmouth under the Warwick (or Williams) charter of 1644, but during 1651-1654 Warwick and Providence were temporarily separated from the other two towns. Warwick was the birthplace of General Nathanael Greene.
WARWICKSHIRE

The East and West Junction railway, from Blisworth in Northamptonshire, serves Stratford-on-Avon and terminates at Broom Junction on the Evesham line of the Midland. Water communications through the east of the county is afforded by the Oxford and Coventry canals. The Warwick & Napton canal joins the Oxford at Napton; the Warwick & Birmingham joins these towns, and the Stratford-on-Avon is a branch from it. The Fazeley canal runs N.E. from Birmingham. None of the rivers is of commercial value for navigation.

Population and Administration.—The area of the ancient county is 577,462 acres, with a population in 1891 of 805,072, and in 1901 of 897,835, the chief centres of increase lying naturally in the parts about Birmingham and Coventry. The area of the administrative county is 579,885 acres. The municipal boroughs are: Aston Manor (pop. 77,326), Birmingham (522,304), Coventry (69,978), Leamington, officially Royal Leamington Spa (26,888), Nuneaton (24,906), Stratford-on-Avon (8310), Sutton Coldfield (14,264), and Warwick (11,886), the county town. The urban districts are: Bulkington (1548), Erdington (16,368), Kenilworth (4544) and Rugby (16,830). Among the towns not appearing in these lists there should be mentioned: Alcester (3263), Atherstone (5248), Bedworth (7160), Comlish (2532), Foleshill (5514) and Solihull (7577). Warwickshire is in the midland circuit, and assizes are held at Warwick. It has one county bench; there are 14 petty sessionsal divisions. The boroughs of Birmingham, Coventry, Royal Leamington Spa, Stratford-on-Avon, Sutton Coldfield and Warwick have separate commissions of the peace, and the boroughs of Birmingham and Warwick have, in addition, separate courts of quarter sessions. The total number of civil parishes is 267. The county, which is mostly in the diocese of Worcester, but also extends into those of Lichfield, Gloucester, Peterborough and Oxford, contains 207 ecclesiastical parishes or districts, wholly or in part. Warwickshire has four parliamentary divisions—Northern or Tamworth, North-eastern or Rugby, Central or Stratford-on-Avon, and South-western (Warwick). Each returning one member.

The parliamentary boroughs of Aston Manor, Coventry and Warwick return one member each, and that of Birmingham has seven divisions, each returning one member.

Birmingham is the seat of a university, of the large grammar school of King Edward VI., and of other important educational institutions. At Rugby is one of the most famous of English public schools. The King's School, Warwick, is a large boys' school, and the Leamington High School is for girls. There is a daily public train from the large railway collecting centres at Rugby and Warwick, in connexion with Mason University College, Birmingham. Among other institutions there may be mentioned the Lady Warwick College for the instruction of women in the higher branches of agriculture, &c., founded by Frances, countess of Warwick, at Reading in 1861, and subsequently removed to Studley Castle in the county, where there is accommodation for 50 students.

History.—The earliest English settlers in the district now known as Warwickshire were a tribe of Hwicas who, pushing up the Severn valley in the 6th century, made their way along the passages afforded by the Avon valley and the Roman Fosse Way, the extent of their settlement being indicated by the ancient limits of the diocese of Worcester. The vast forest of Arden, stretching from the Avon to the site of the modern Birmingham, barred any progress northwards, at the same time affording protection to the Anglo-Saxon tribes who were already settled about Atherstone, and it was only after the battle of Cirencester in 628 that the whole of the Hwican territory was comprised in Mercia. In 675 Cosford was included in the endowment of Edburh, and in 757 Ethelfled placed it in his gift to Sigeheard, in a battle with the West Saxons. The shire of Warwick originated in the 10th century about Æthelflæd's new burgh at Warwick, and is mentioned by name in the Saxon Chronicle in 1016, when it was harried by Canute. The Danes made frequent incursions in the district in the 10th and 11th centuries, but no traces of their settlements occur south of Rugby.

The Shire offered little resistance to the Conqueror, who was

south-eastern boundary runs the highest line of hills in the county, reaching some 800 ft., and including Edge Hill (which gives name to the county), and Nuneaton and Alcester, Stratford and Leamington, and the Shuckburgh hills. The county boundary has been pencilled across the highest line of hills, to include the headwaters of some of the feeders of the Cherwell, and thus a small part of the drainage area of the Thames. These hills rise abruptly, and command wide views over the countryside. The finest silvan scenery is found on the banks of the Avon; the position of Guy's Cliffe and of Warwick Castle are well-known examples. It is not difficult to trace the influence of the scenic characteristics of the county in the writings of its most famous son, William Shakespeare.

Geology.—The Arkean rocks are represented by some volcanic ashstones, and by some eroded rocks (the Caldeaton Series), which are confined to the north-west of Nuneaton. They dip south-westward under the Cambrian beds—Harshill Quartzite and Stockingford Shales—which give rise to high grassland; the latter, which is opened up in numerous large redstone quarries, contains towards its summit a fauna suggesting that of the Olenellus zone, one of the oldest faunas known. The quartzite as well as the overlying shales is seen to have intrusive dykes of diorite, which transform the formation, and include the oldest rocks, which are the equivalents of the Keble Beds of Staffordshire, and like them should be grouped with the Coal Measures. The general altitude is lower in the north than in the south, and in the centre is a considerable range of hills; the highest, the Birmingham, and the second highest, the South Warwick, is but a hill. Coventry, at the foot of the former, and at Coley form high ground (625 ft.); in several places shafts have been sunk through them to the productive Coal Measures below. The rest of the county is occupied in the northern half by the Trias, a rock of great extent and in the south by the Lias. Of the Trias the Bunter (soft red sandstones with pebble-beds) is represented only by Birmingham and Sutton Coldfield, where it is succeeded by the Keuper Sandstone, which is occasionally exposed above and the edge of the coalfield (Trowleswell, Covercote, and Maxtoke); the Keuper Marl occupies a large area in the centre of the county, while some sandstones in them form picturesque scarp near Tamworth. The highest point in southwest Warwickshire is Rugby, where the Lias are seldom exposed. The Lower Lias limestones are worked for cement (as near Rugby) and abound in amonites. The Middle Lias sands and limestones follow, and form escarpments (as at Edge Hill, 710 ft.); but these and the lowest members of the Oolite series scarcely cross the county boundary from Oxfordshire. Glacial drifts—boulder-clay, sand and gravel—overspread large areas of the older rocks; their composition shows them to have been derived from the ice-sheets which crept the mineral from the Irish Sea, from North Wales and from the North Sea. Later fluvial and glacial gravels of the Avon valley have yielded mammalian remains, and the Hauptmann, in the middle member of the rocks, and elsewhere, have been found in the old gravels of the Daugavpils near Birmingham. Coal, ironstone, lime and cement are the chief mineral products; manganese ore was formerly got from the Cannock rocks.

Climate and Agriculture.—The climate is generally mild and healthy. The soil is on the whole good, and consists of various loams, sands, gravels, silt, and gravel, with considerable chalk for most of the area. It is rich in pasture-land, and dairy-farming is increasing. It has excellent orchards and market-gardens, and possesses some of the finest woodlands in England. About five-sixths of the total area, a high proportion, is under cultivation, and of the rest about three-fifths is in permanent pasture. Oats and wheat occupy the greater part of the area under grain crops. In connexion with the cattle-rearing and dairy-farming, over half the acreage under green crops is in grass and clover, the chief grasses being white clover and red clover. There are important industries.

Industries.—The industrial part of the county is the northern part, which includes the greatest manufacturing centre of the Midland Counties, though a large part of the industry has been transferred into Staffordshire and Worcestershire. Metal-working in all branches is prosecuted here, besides other industries. Coventry is noted for cycle-making, and, with Bedworth and Nuneaton and the intervening villages, is a seat of the ribbon and tape-makers. A small iron and coalfield occurs in the north-east, extending outside the county northward from Coventry. Clay, limestone and other stone are quarried at various points, and an appreciable amount of iron ore is extracted.

Communications.—The main line of the London & North-Western railway runs within the county, near the N.E. boundary, by Rugby, Nuneaton, Atherstone, Tamworth, with branches to Leamington and Warwick, Coventry and Birmingham, and cross-branches. The northern line of the Great Western railway runs through Leamington and Warwick to Birmingham, with branches to Stratford-on-Avon and Henley-in-Arden. The Leamington and Nuneaton to Stratford line of the Midland railway crosses the north of the county by Nuneaton, and the Birmingham-Evesham line of this company serves Alcester.
at Warwick in 1668, and Thurlkill the sheriff was one of the few Englishmen to retain large estates which he had held before the conquest, his family long continuing in the county under the name of Arden. The fortification which he had raised at Warwick William entrusted to Henry, son of Roger de Beaumont, afterwards earl of Warwick, and Robert, count of Meulan, Henry's elder brother, had an important seat. Coventry Minster was richly endowed, and in 1285 the prior claimed among other privileges to have an independent coroner and to hold two courts a year. The earldom and castle of Warwick subsequently passed to the Beauchamps, and in the reign of Henry VI. to the Nevilles. The Clontons, founders of the castles and priories at Maxstoke and Kenilworth, enjoyed large estates in the county during the Norman period.

The ten Domesday hundreds of Warwickshire are now reduced to four, all of which are mentioned in the 12th century. Hemmington represents the Domesday hundred of Coleshill; Knightlow, the Domesday hundreds of Bemelau, Meretone and Stanlely; Kineton, the Domesday hundreds of Tremelau, Honesberic, Fexholke and Berricestone; Barlichway, the Domesday hundreds of Ferncumbe and Patela. Coleshill took its name from Coleshill, a town near the junction of the Cole and the Blythe; Hemmington from a ford over the Tame near Kingsbury; Kineton, from a ford or brook near the Dunt in Warwickshire; Stanleli from the villages of Marton and Stoneleigh; Berricestone from Barcheston on the Stour; Barlichway from a plot of ground on a hill between Haselor and Burton. Patela hundred, which derived its name from a tumulus between Wooton Waven and Stratford-on-Avon, was a liberty of the bishops of Worcester, and in the 17th century, though reckoned part of Barlichway hundred, possessed a court leet and court baron. The boundaries of Warwickshire have remained practically unchanged since the Domesday Survey, but Spilsbury, now in Oxfordshire, Romsey, Shipley, Quat and Rudge, now in Shropshire, were assessed under this county, while Sawbridge, Berkswell, Whitacre, Over and Whichford, now in this county, were assessed under Northamptonshire. Warwickshire was united with Leicestershire under one sheriff until 1566, the shire court for the former being held at Warwick.

In the 13th century Warwickshire included the deaneries of Warwick and Kineton within the archdeaconry and diocese of Worcester; the rest of the county constituting the archdeaconry of Coventry within the Lichfield diocese, with the deaneries of Coventry, Stoneley, Merion and Arden. In 1286 the archdeaconry of Coventry was annexed to the diocese of Worcester, and in 1534 its deaneries were entirely reconstituted and made thirteen in number. In 1681 the deanery of Alcester was formed within the archdeaconry of Worcester, and Kineton was divided into North Kineton and South Kineton. In 1804 the deaneries of Aston, Birmingham, Coleshill, Northfield, Polesworth, Solihull and Sutton Coldfield were formed into the archdeaconry of Birmingham, the archdeaconry of Coventry now including the deaneries of Atherstone, Baginton, Coventry, Dascott Magna, Dunchurch, Leamington, Monks Kirby, Rugby and Selwood.

In the wars of the reign of Henry III. Simon de Montfort placed Kenilworth Castle in charge of Sir John Giffard, who in 1264 attacked Warwick Castle and took prisoner the earl and countess of Warwick, who had supported the king. During the Wars of the Roses the Neville, represented by the earl of Warwick, supported the Yorkist cause, while Coventry was a Lancastrian stronghold. On the outbreak of the Civil War of the 17th century Warwickshire and Staffordshire were associated for the parliament by Lord Brooke. On the battle of Edgehill, this was argued in 1642, and in 1643 Birmingham, then a small town noted for its Puritanism, was sacked by Prince Rupert. Coventry endured a siege in 1642, and skirmishes took place at Southam and Warwick.

At the time of the Domesday Survey the industries of Warwickshire were almost exclusively agricultural, the extensive woodlands north of the Avon affording pasture for sheep, while meadows and water-mills were numerous in the river valleys. The woolen industry flourished in Norman times, and Coventry was famed for its wool and broadcloths in the reign of Edward III. Coal was probably dug at Griff in the 12th century, but the Warwickshire collieries only came into prominence in the 17th century, when John Briggs of Bedworth made an attempt to monopolize the coal trade. Birmingham was already famous for its smiths and cutlers in the 17th century. In the early 17th century the depopulation and distress caused by the enclosures of land for pasture led to frequent riots. The silk industry at Coventry and the needle industry about Alcester both flourished in the 18th century.

Warwickshire returned two members to the parliament of 1290, and in 1295 Coventry and Warwick were each represented by two members. Tamworth returned two members in 1584. Under the Reform Act of 1832 the county returned four members in two divisions; Birmingham was represented by two members, and Tamworth was disfranchised. Under the act of 1868 the representation of Birmingham was increased to three members.

Antiquities.—Of pre-Norman architecture some traces appear in the church of Wootton-Warwick in the Arden (or west) district. Otherwise the type is scarce, but Saxon remains, such as burial urns and jewelry, have been found in several places, as near Bensford Bridge on Watling Street; St. John's Church at Warstone and its apses are famous, and among village churches there are many fine examples. Of those retaining Norman portions may be mentioned: Wolston and Berkwell in the Coventry district; Gateley, formerly of St. Leonard's and Chaderton, and Chelford and, in the south, in the neighbourhood of Edgehill, Burton Dassett, a very noteworthy building, and Warmington, where there is a remarkable specimen of domus inclusi or architect's chamber. There are also fine examples of Decorated work, such as Knowle, Solihull and Temple Balsall in Arden, and Brailes under the southern hills. Among the numerous religious houses in the county several have left remains: Sunbury, Eardige and Hertford, all in the Coventry, of the 12th century, adjoining the mansion of that name in a beautiful park; of Merevale near Atherstone; and of Stoneleigh near Kenilworth, also adjoining a famous mansion. This abbey was a 12th-century foundation, but a majestic gatehouse of the 14th century also stands. Maxstoke Priory, in Arden, was a foundation for Augustinian canons of the 14th century. Worxall Abbey was a Benedictine nunnery of the 12th century; but the name is given to a modern mansion. In view of the large share the county has had in war, it is not surprising to find many examples of great fortified houses or castles. Warwick Castle and Kenilworth are still a splendid testimony to the older style of ruin, are described under those towns. At Harthill (the birthplace of Michael Drayton the poet) there is a fragment of a Norman castle. Among fortified mansions Maxstoke Castle is of the 14th century; Rockingham, now in Northampton, but once near Barlby, and Chillington, now in Staffordshire, were assessed under this county, while Sawbridge, Berkswell, Whitacre, Over and Whichford, now in this county, were assessed under Northamptonshire. Warwickshire was united with Leicestershire under one sheriff until 1566, the shire court for the former being held at Warwick.

WASH, THE, a shallow bay of the North Sea, on the Lincolnshire and Norfolk coast of England. It is roughly square in shape, penetrating the land for 22 m., and being 20 m. wide at the head and 12 at the mouth. Through the sandbanks which form its bed there are two main channels into deep water; one, Boston Deep, is kept open by the waters of the Witham and Witham Deep. There is another, Lincoln Deep, between the Nene and the Great Ouse. The Wash is the remnant of a much larger bay, which covered a large part of the Fens which now border it; it is gradually filling with the deposits of the rivers, and from time to time small portions are reclaimed (see Fens). The flat bordering lands are protected by sea-walls. The formerly dangerous passage of the marsh-lands, which were liable to irrigations of the tide, is illustrated by the accident to
WASHINGTON, C. C.—WASHINGTON, GEORGE

WASHINGTON, BOOKER TAILIFERRO (c. 1809—) American negro teacher and reformer, was born on a plantation near Hale's Ford, Franklin county, Virginia. Soon after the Civil War he went to Malden, West Virginia, where he worked in a salt furnace and then in a coal mine. He obtained an educational appointment at night schools, and worked as a house servant in a family where his ambition for knowledge was encouraged. In 1872, "by walking, begging rides both in wagons and in the cars," he travelled 500 m. to the Hampton (Virginia) Normal and Agricultural Institute, where he remained three years, working as janitor for his board and education, and graduated in 1875. For two years he taught at Malden, West Virginia, and studied for eight months (1878-1879) at the Wayland Seminary in Washington, D.C. In 1879 he became instructor at the Hampton Institute, where he trained about twenty-five American Indians with whom General S. C. Armstrong was carrying on an educational experiment, and he developed the night school, which became one of the most important features of the institution. In 1881 he was appointed organizer and principal of a negro normal school at Tuskegee, Alabama (q.v.), for which the state legislature had made an annual appropriation of $2,000. Opened in July 1881 in a little shanty and church, the Tuskegee Normal and Industrial Institute became, under Washington's presidency, the foremost exponent of industrial education for the negro. To promote its interests and to establish better understanding between whites and negroes, Washington, in 1887, was appointed a special ambassador from the United States, notably a speech in 1895 at the opening of the Atlanta Cotton States and International Exposition. In 1900 at Boston, Massachusetts, he organized the National Negro Business League. Harvard conferred upon him the honorary degree of A.M. in 1896, and Dartmouth that of LL.D. in 1901.

Among his publications are a remarkable autobiography, Up from Slavery (1901), The Future of the American Negro (1899), Sowing and Reaping (1900), Character Building (1903). Working with the Hands (1910), Tuskegee and its People (1905), Putting the Most into Life (1906), Life of Frederick Douglas (1907), The Negro in Business (1910), The Story of the Negro (1910),

WASHINGTON, BUSHROD (1762-1829), American jurist, nephew of George Washington, was born in Westmoreland county, Virginia, on the 13th of June 1762. He graduated in 1778 at the College of William and Mary, where he was an original member of the Phi Beta Kappa Society; was a member of a volunteer cavalry troop in 1780; studied law in Philadelphia in 1781, and began practice in his native county. He served in the House of Delegates in 1787, and in the following year sat in the convention which ratified for Virginia the Federal Constitution. After living in Alexandria for a short time he removed to Richmond and in 1788 was appointed a jurist of the United States Supreme Court by President John Adams. He was George Washington's literary executor, and supervised the preparation of John Marshall's Life of Washington (5 vols., 1804-1807); and on Mrs Washington's death in 1802 he inherited Mount Vernon and a part of the estate. He died in Philadelphia on the 26th of November 1829.

WASHINGTON, GEORGE (1732-1799), the first president of the United States, was born at Bridges Creek, Westmoreland county, Virginia, on the 22nd (Old Style) of February 1732. He was the grandson of Mr Henry E. Waters, who seems to have established the connexion of the family with the Washingtons of Sulgrave, Northamptonshire, England. The brothers John and Lawrence Washington appear in Virginia in 1638. John took up land at Bridges Creek, became a member of the House of Burgesses in 1666, and died in 1676. His eldest son, Lawrence, married Mildred Warner, by whom he had three children—John, Augustine (1664-1743) and Mildred. Augustine Washington married twice. By the first marriage, with Jane Butler, there were four children, two of whom, Lawrence and Augustine, grew to manhood. By the second marriage, in 1739, with Mary Ball, descendant of a family which migrated to Virginia in 1657, there were six children—George, Betty, Samuel, John, Charles and Mildred. Upon the death of the father, Lawrence inherited the estate at Hunting Creek, on the Potomac,
WASHINGTON, GEORGE

345

later known as Mount Vernon, and George the estate on the Rappahannock, nearly opposite Fredericksburg, where his father usually lived.

Of Washington's early life little is known, probably because there was little unusual to tell. The story of the hatchet and the cherry-tree, and similar tales, are undoubtedly apocryphal, having been coined by Washington's most popular biographer, Mason Weems (d. 1825). There is nothing to show that the boy's life was markedly different from that common to Virginia families in easy circumstances; plantation affairs, hunting, fishing, and a little reading making up its substance. From 1735 to 1739 he lived at what is now called Mount Vernon, and afterwards at the estate on the Rappahannock. His education was one of leisure rather than of duty, and he was allowed to pursue a course in which he was largely self-taught; and although at his death he left a considerable library, he was never an assiduous reader. Although he had throughout his life a good deal of official contact with the French, he never mastered their language. Some careful reading of good books there must have been, however, for in spite of pervading illiteracy, common in that age, in matters of grammar and spelling, he acquired a dignified and effective English style. The texts of his writings, as published by Jared Sparks, have been so edited in these respects as to destroy their value as evidence; but the text of his son is as joyously free as that of his father, and the opposition of the boy's mother put an end to the scheme, seems to lack proof. In 1748, however, through the influence of Thomas Lord Fairfax, the head of the family, who had come to America to live, Washington, then only sixteen years of age, was appointed surveyor of the Fairfax property; and an appointment as public surveyor soon followed. The next three years were spent in this service, most of the time on the frontier. He always retained a disposition to speculate in western lands, the ultimate value of which he early appreciated; many of his later investments of this character are treated in C. W. Butterfield's "Washington-Crawford Letters" (1877). He seems, too, to have impressed others already with his force of mind and character. In 1751 he accompanied his half-brother Lawrence, who was stricken with consumption, to the West Indies, where he had an attack of small-pox which left him marked for life. Lawrence died in the following year, making George executor under the will and residuary heir of Mount Vernon; and the latter estate became his in 1761.

In October 1753, on the eve of the last French and Indian war, Washington was chosen by Governor Robert Dinwiddie as the agent to warn the French away from their new posts on the Ohio, in western Pennsylvania. He accomplished the winter journey safely, though with considerable danger and hardship; and shortly after his return was appointed lieutenant-colonel of a Virginia regiment, under Colonel Joshua Fry. In April 1754, he set out with two companies for the Ohio, defeated (28th May) a force of French and Indians at Great Meadows (in the present Fayette county, Pennsylvania), but at Fort Necessity in this vicinity was forced to capitulate (3rd July), though only after a vigorous defense of his small force. In these services he received the thanks of the House of Burgesses. When General Edward Braddock arrived in Virginia in February 1755, Washington wrote him a diplomatically worded letter, and was presently made a member of the staff, with the rank of colonel. His personal relations with Braddock were friendly throughout, and in the calamitous defeat he showed for the first time that fiery energy which always lay hidden beneath his calm and unruffled exterior. He ranged the whole field on horseback, making himself the most conspicuous target for Indian bullets, and, in spite of what he called the "dastardly behaviour" of the regular troops, saved the expedition from annihilation, and brought the remnant of his Virginians out of action in fair order. In spite of his reckless exposure, he was one of the few unwounded officers. In August, after his return, he was commissioned commander of the Virginia forces, being then twenty-three years old. For about two years his task was that of "defending a frontier of more than 350 m. with 700 men," a task rendered the more difficult by the insubordination and irregular service of his soldiers, and by irritating controversies over official precedence. To settle the latter question he made a journey to Boston, in 1756, to confer with Governor William Shirley. In the winter of 1757 his health broke down, but in the next year he had the pleasure of commanding the advance guard of the expedition under General John Forbes which occupied Fort Duquesne and renamed it Fort Pitt. (See PITTSBURG: History.) At the end of the year he resigned his commission, the war in Virginia being at an end, and married Martha Dandridge (1732-1803), widow of Daniel Parke Custis.

For the next fifteen years Washington's life at Mount Vernon, where he made his home after his marriage, was that of a typical Virginia planter of the more prosperous sort, a consistent member and vestryman of the Established (Episcopal) Church, a large slave-holder, a strict but considerate master, and a widely trusted man of affairs. His extraordinary escape in Braddock's defeat had led a colonial preacher to declare in a sermon his belief that the young man had been preserved to be "the savior of his country"; but if there was any such impression it soon died away, and Washington gave his associates no reason to consider him a man of uncommon endowments. His marriage brought him an increase of about $100,000 in his property, making him one of the richest men in the colonies; and he was able to develop his plantation and enlarge its extent. His attitude towards slavery had been much discussed, but it does not seem to have been different from that of many other planters of that day: he did not think highly of the system, but had no invincible repugnance to it, and saw no way of getting rid of it. In his treatment of slaves he was exacting, but not harsh, and was willing, when employing them, to give them a minute methodical conduct of business, generous indulgence in hunting, comparatively little reading and a wide acquaintance with the leading men of the colonies, but no marked indications of what is usually considered to be "greatness." As in the case of Lincoln, he was educated into greatness by the increasing weight of his responsibilities and the manner in which he met them. Like others of the dominant planter class in Virginia, he was repeatedly elected to the House of Burgesses, but the business which came before the colonial assembly was for some years of only local importance, and he is not known to have made any set speeches in the House, or to have said anything beyond a statement of his opinion and the reasons for it. He was present on the 20th of May 1765, when Patrick Henry introduced his famous resolutions against the Stamp Act. That he thought a great deal on public questions, and took full advantage of his legislative experience as a means of political education, is shown by his letter of the 3rd of April 1766 to his neighbour, George Mason, communicating the Philadelphia non-importation resolutions, which had just reached him. In this he considers briefly the hard and the ease of peaceable resistance to the policy of the ministry, but even at that early date faces frankly and fully the probable final necessity of resisting by force, and endorses it, though only as a last resort. In May following, when the House of Burgesses was dissolved, he was among the members who met at the Raleigh tavern and adopted a non-importation agreement; and he himself kept the agreement when others did not. Though on friendly terms with Governor Norborne Berkeley, Baron...
WASHINGTON, GEORGE

Botetourt and his successor, John Murray, earl of Dunmore, he nevertheless took a prominent part, though without speechmaking, in the struggles of the Assembly against Dunmore, and his position was always a radical one. As the breach widened, he even opposed petitions to the king and parliament, on the grounds that the claim to taxation and control had been put forward by the ministry on the basis of right, not of expediency, that the ministry could not abandon the claim of right and the colonies could not admit it, and that petitions must be, as they already had been, rejected. "Shall we," he writes in a letter, "after this whine and cry for relief?"

On the 5th of August 1774 the Virginia convention appointed Washington as one of seven delegates to the first Continental Congress, which met at Philadelphia on the 5th of September, and with this appointment his national career, which was to continue with but two brief intervals until his death, begins. His letters during his service in Congress show that he had fully grasped the questions at issue, that he was under no delusions as to the outcome of the struggle over taxation, and that he expected war. "More blood will be spilled on this occasion," he wrote, "if the ministry are determined to push matters to extremity, than history has ever yet furnished instances of in the annals of North America." His associates in Congress at once recognized his military ability, and although he was not a member of any of the committees of the Congress, he seems to have aided materially in securing the endorsement by Congress of the Suffield county (Mass.) looking toward organized resistance. On the adjournment of the Congress he returned to Virginia, where he continued to be active, as a member of the House of Burgesses, in urging on the organization, equipment and training of troops, and even undertook in person to drill volunteers. His attitude towards the mother country at this time, however, must not be misunderstood. Much as he expected war, he was not yet ready to declare in favour of independence, and he did not ally himself with the party of independence until the course of events made the adoption of any other course impossible.

In March 1775 he was appointed a delegate from Virginia to the second Continental Congress, where he served on committees for fortifying New York, collecting ammunition, raising money and formulating army rules. It seems to have been generally understood that, in case of war, Virginia would expect him to act as her commander-in-chief, and it was noticed that, in the second Congress, he was the only member who habitually appeared in uniform. History, however, was to settle the matter on broader lines. The two most powerful colonies were Virginia and New York, New York's selection (June 1775) of General John Adams of Massachusetts, of Washington as commander-in-chief of the armed forces of the United Colonies. Refusing any salary and asking only the reimbursement of his expenses, he accepted the position, asking "every gentleman in the room," however, to remember his declaration that he did not believe himself to be equal to the command, and that he accepted it only as a duty made imperative by the unanimity of the call. He reiterated this belief in private letters even to his wife; and there seems to be no doubt that, to the day of his death, he was the most determined sceptic as to his fitness for the positions to which he was successively called. He was commissioned on the 17th of June 1775, set out at once for Cambridge, Mass., and on the 3rd of July took command of the levies there assembled for action against the British garrison in Boston. The battle of Bunker Hill had already taken place, news of it reaching him on the way north. Until the following March, Washington's work was to bring about some semblance of military organization and discipline, to collect ammunition and military stores, to correspond with Congress and the colonial authorities, to guide military operations in widely separate parts of the country, to create a military system for the people there, to indirectly turn to such a thing and impatient and suspicious under it, and to bend the course of events steadily towards driving the British out of Boston. He planned the expeditions against Canada under Richard Montgomery and Benedict Arnold, and sent out privateers to harass British commerce. It is not easy to see how Washington survived the year 1775; the colonial poverty, the exasperating annoyances, the outspoken criticism of those who demanded active operations, the personal and party dispassions in Congress, the selfishness or stupidity which cropped out again and again among some of the latter parties was enough to have broken down most men. They completed his training. The change in this one winter is very evident. If he was not a great man when he went to Cambridge, he was both a general and a statesman in the fullest sense when he drove the British out of Boston in March 1776. From that time until his death he was admittedly the foremost man of the continent.

The military operations of the remainder of the War of Independence are described elsewhere (see American War of Independence). Washington's retreat through New Jersey; the retreat of the army which was defeated at Brandywine, Terence and Princeton, and then established himself at Morristown, so as to make the way to Philadelphia impassable; the vigil with which he handled his army at the Brandywine and Germantown; the persistence with which he held the strategic position of Valley Forge through the dreadful winter of 1776-1777, in spite of the misery of his men, the clamours of the people and the impotence and meddling of the fugitive Congress—all went to show that the fibre of his public character had been hardened to its permanent quality. "These are the times that try men's souls," wrote Thomas Paine at the beginning of 1776, and the words had added meaning in each year that followed; but Washington had no need to fear the test. The spirit which culminated in the treason of Benedict Arnold was a serious addition to his burdens; for what Arnold did others were almost ready to do. Many of the American officers, too, had taken offence at the close personal friendship which had sprung up between the marquis de Lafayette and Washington, and at the diplomatic deference which the commander-in-chief felt compelled to show to other foreign officers. Some of the foreign volunteers were eventually dissatisfied by the slow and steady progress of the American movement and could not be found for them. The name of one of them, Thomas Conway, an Irish soldier of fortune from the French service, is attached to what is called "Conway's Cabal," a scheme for superseding Washington by General Horatio Gates, who in October 1777 succeeded in forcing Burgoyne to capitulate at Saratoga, and who had been persistent in his depreciation of the commander-in-chief and in intriguing with members of Congress. A number of officers, as well as of men in civil life, were mixed up in the plot, while the methods employed were the lowest forms of the infamous slander; but at the first breath of exposure every one concerned hurried to cover up his part in it, leaving Conway to shoulder both the responsibility and the disgrace. The treaty of alliance of 1778 with France, following the surrender of Burgoyne, put an end to all such plans. It was absurd to expect foreign nations to deal with a second-rate man as commander-in-chief while Washington was in the field, and he seems to have had no further trouble of this kind. The prompt and vigorous pursuit of Sir Henry Clinton across New Jersey towards New York, and the battle of Monmouth, in which the plan of battle was thwarted by Charles Lee, another foreign recruit of popular reputation, closed the military record of Washington, so far as active campaigning was concerned, until the end of the war. The British confined their operations to other parts of the continent, and Washington, alive as ever to the importance of keeping up connexion with New England,
devoted himself to watching the British in and about New York City. It was in every way fitting, however, that he who had been the mainspring of the war from the beginning, and had borne far more than his share of its burdens and discouragements, should end it with the campaign of and 1783. After the surrender of Cornwallis (October 1781). Although peace was not concluded until September 1783, there was no more important fighting. Washington retained his commission until the 23rd of December 1783, when, in a memorable scene, he returned it to Congress, then in session at Annapolis, Md., and retired to Mount Vernon. His expenses during the war, including secret service money, aggregated about $64,000; in addition he expended a considerable amount from his private fortune, for which he made no claim to reimbursement.

By this time the popular canonization of Washington had fairly begun. He occupied a position in American public life and in the American political system which no man could possibly hold again. He may be said to have become a political element quite apart from the Union, or the states, or the people of either. In a country in which newspapers had at best only a local circulation, and where communication was still slow and difficult, the knowledge that Washington favoured anything superseded, with very many men, both argument and the necessity of information. His constant correspondence with the governors of the states gave him a quasi-paternal attitude towards government in general. Moreover, he did much to persuade them that he was able to do what no other man could have done with either propriety or safety; he addressed a circular letter to the governors, pointing out changes in the existing form of government which he believed to be necessary, and urging "an indissoluble union of the states under one federal head," "a regard to public justice," the adoption of a suitable military establishment for a time of peace, and the making of "those mutual concessions which are requisite to the general prosperity." His refusal to accept a salary, either as commander-in-chief or as president, might have been taken as affectation or impertinence in any one else; it seemed natural and proper enough in the case of Washington, but it was his peculiar privilege. It is even possible that he might have had a crown, had he been willing to accept it. The army, at the end of the war, was justly dissatisfied with its treatment. The officers were called to meet at Newburgh, and it was the avowed purpose of the leaders of the movement to march the army westward, appropriate vacant public lands as part compensation for arrears of pay; leave Congress to negotiate for peace without an army, and to make "the unanimous voice of the army" prevail in all. Less publicly avowed was the purpose to make their commander-in-chief king, if he could be persuaded to aid in establishing a monarchy. Washington put a summary stop to the whole proceeding. A letter written to him by Colonel Lewis Nicola, on behalf of this coterie, detailed the weakness of a republican form of government as they had experienced it, their desire for "mixed government," with him at its head, and their belief that the title of king would be objectionable to but few and of material advantage to the country. His reply was peremptory and indignant. In plain terms he stated his abhorrence of the proposal; he was at a loss to conceive what part of his conduct could have encouraged their address; they could not have found "a person to whom their schemes were more disagreeable"; and he charged them, "if you have any regard for yourself or posterity, or respect for me, to banish these thoughts from your mind, and never communicate, as from yourself or any one else, a sentiment of the like nature." His influence, and his alone, secured the quiet disbanding of the discontented army. That influence was as powerful after he had retired to Mount Vernon as before the resignation of his command. The Society of the Cincinnati, an organization composed of officers of the late war, chose him as its first president; but he insisted that the Society should abandon its plan of hereditary membership, and change other features of the organization against which there had been public clamour. When the legislature of Virginia gave him 150 shares of stock in companies formed for the improvement of the Potomac and James rivers, and he was unable to refuse them lest his action should be misinterpreted, he extricated himself by giving them to educational institutions. His voluminous correspondence shows his continued concern for a standing army and elected him for a second time in former military posts, and his interest in the development of the western territory. From public men in all parts of the country he received such a store of suggestions as came to no other man, digested it, and was enabled by means of it to speak with what seemed infallible wisdom. In the midst of a burden of letter-writing, the minute details in his diaries of tree-planting and rotation of crops, and his increasing reading on the political side of history, he found time to entertain a stream of visitors from all parts of the United States and from abroad. Among of his visits in March 1785, at Annapolis, Md., and Alexandria (MD), he met at Alexandria (MD) to frame a commercial code for Chesapeake Bay and the Potomac, and made an opportunity to visit Mount Vernon. From that moment the current of events, leading into the Annapolis Convention (see ANNA-
polis, Md.) of 1786 and the Federal Convention of the following year, shows Washington's close supervision at every point.

When the Federal Convention met at Philadelphia in May 1787 to frame the present constitution, Washington was present as a delegate from Virginia, though much against his will; and a unanimous vote at once made him the presiding officer. Natural-ly, therefore, he did not participate in debate; and he seems to have spoken but once, and then to favour an amendment reducing from 40,000 to 30,000 the minimum population required as a basis of representation in the House. The mere suggestion, coming from him, was sufficient, and the change was at once agreed to. He approved the constitution which was decided upon, believing, as he said, "that it was the best constitution which could be obtained at that epoch, and that this or a dissolution awaits our choice, and is the only alternative. As president of the convention he signed the constitution, and kept the papers of the convention until the adoption of the new government, when they were deposited in the Department of State. All his vast influence was given to secure the ratification of the new instrument, and his influence was probably decisive. When enough states had ratified to assure the success of the new government, and the time came to elect a president, there was no hesitation. The office of president had been "cut to fit the measure of George Washington," and no one thought of any other person in connexion with it. The unanimous vote of the electors made him the first president of the United States; and, as president, he continued to receive an annual salary of 3,000; and even after he had positively refused to serve for a third term, two electors voted for him in 1796-1797. The public events of his presidency are given elsewhere (see UNITED STATES, § History). While the success of the new government was the work of many men and many causes, one cannot resist the conviction that the factor of chief importance was the existence, at the head of the executive department, of such a character as Washington. It was he who gave to official intercourse formal dignity and distinction. It was he who secured for the president the power of removal from office without the intervention of the Senate. His support of Hamilton's financial plans not only insured a speedy restoration of public credit, but also, and even more important, gave the new government constitutional ground on which to stand; while his firmness in dealing with the "Whisky Insurrection taught a much-needed and wholesome lesson of respect for the Federal power. His official visits to New England in 1786, to Rhode Island in 1790 and to the South in 1791 enabled him to test public opinion at the same time that they increased popular interest in the national government. Himself not a political partisan, he held the two natural parties apart, and prevented party contest until the government had become too firmly established to be shaken by them. Perhaps the final result would not in any case have failed, even had "blood and iron" been necessary to bring it about; but the quiet attainment of the result was due to the personality of Washington, as well as to the political sense of the American people.
Washington, George

It would be a great mistake to suppose, however, that the influence of the president was fairly appreciated during his term of office, or that he himself was uniformly respected. Washington seems never to have understood fully either the nature, the significance, or the inevitable necessity of party government in a republic. Instead, he attempted to balance party against party, selected representatives of opposing political views to serve in his first cabinet, and sought in that way to neutralize the effects of parties. The consequence was that the two leading members of the cabinet, Alexander Hamilton and Thomas Jefferson, exponents for the most part of diametrically opposite political doctrines, soon occupied the position, to use the words of one of them, of “two game-cocks in a pit.”

The unconscious drift of Washington’s mind was toward the Federalist party; his letters to La Fayette and to Patrick Henry, in December 1798 and January 1799, make that evident even without the record of his earlier career as president. It is inconceivable that, to a man with his type of mind and his extraordinary experience, the practical sagacity, foresight, and aggressive courage of the Federalists should not have seemed to embody the best political wisdom, however little he may have been disposed to ally himself with any party group or subscribe to any comprehensive creed. Accordingly, when the Democratic-Republican party came to be formed, about 1793, it was not to be expected that its leaders would long submit with patience to the continual interposition of Washington’s name and influence between themselves and their opponents; but they maintained a calm exterior. Some of their fellow-citizens of less discernment, the president included, wavered in the problem of neutrality, in the war between England and France, excited them to anger; his support of Jay’s treaty with Great Britain roused them to fury. His firmness in thwarting the activities of Edmond Charles Edouard Genet, minister from France, alienated the partisans of France; his suppression of the “Whisky Insurrection” aroused in some the fear of a military despotism. Forged letters, purporting to show his desire to abandon the revolutionary struggle, were published; he was accused of drawing more than his salary; his manners were ridiculed as “aping monarchy”; hints of the propriety of a guillotine for his benefit began to appear; he was spoken of as the “stepfather of his country.” The brutal attacks, exceeding in virulence anything that would be tolerated to-day, embittered his presidency, especially during his second term: in 1793 he is reported to have declared, in a cabinet meeting, that “he would rather be in his grave than in his present situation,” and that “he had never repented but once the having slipped the moment of resigning his office, and that was every moment since.”

The most unpleasant portions of Jefferson’s 77c7 are those in which, with an air of psychological dissection of the president, in which the war was driven by the newspaper attacks upon him. There is no reason to believe, however, that these attacks represented the feeling of any save a small minority of the politicians; the people never wavered in their devotion to the president, and his election would have been unanimous in 1796, as in 1792 and 1789, had he been willing to serve.

He retired from the presidency in 1797 and returned to Mount Vernon, his journey thither being marked by popular demonstrations of affection and esteem. At Mount Vernon, which had suffered from neglect during his absence, he resumed the plantation life which he loved, the society of his family, and the care of his slaves. He had resolved some time before never to obtain another slave, and “wished from his soul” that Virginia could be persuaded to abolish slavery; “it might prevent much future mischief”; but the unprecedented profitableness of the cotton industry, under the impetus of the recently invented cotton gin, had already begun to change public sentiment regarding slavery, and Washington was too old to attempt further innovations. Visitors continued to flock to him, and his correspondence, as always, took a wide range. In 1798 he was made commander-in-chief of the quasimilitary army raised in anticipating war with France, and was fretted almost beyond endurance by the quarrels of Federalist politicians over the distribution of commissions. In the midst of these military preparations he was struck down by sudden illness, which lasted but for a day, and died at Mount Vernon on the 14th of December 1799. His disorder was an oedematous affection of the wind-pipe, contracted by exposure during a long ride in a snowstorm, and aggravated by neglect of due personal remedies as bleeding, gargles of “molasses, vinegar and butter” and “vinegar and sage tea,” which “almost suffocated him,” and a blister of cantharides on the throat. He died as simply as he had lived; his last words were only business directions, affectionate remembrances to relatives, and repeated apologies to the physicians and attendants for the trouble he was giving them. Just before he died, says his secretary, Tobias Lear, he felt his own pulse; his countenance changed; the attending physician placed his hands over the eyes of the dying man, “and he expired without a struggle or a sigh.” The third of the series of resolutions introduced in the House of Representatives five days after his death, by John Marshall of Virginia, later chief-justice of the Supreme Court, states exactly, if somewhat rhetorically, the position of Washington in American history: “first in war, first in peace, and first in the hearts of his countrymen.”

1 He had previously, under date of the 17th of September 1796, issued a notable “Farewell Address” to the American people.

2 This characterization originated with Henry Lee.
WASHINGTON, a city and the capital of the United States of America, coeval with the District of Columbia, on the north-east bank of the Potomac river at the head of tide and navigation, 40 m. S.W. of Baltimore, 135 m. S.W. of Philadelphia, and 225 m. S.W. of New York. Area, 60 sq. m. (exclusive of 10 sq. m. of water surface). Pop. in (1930) 350,149, of whom 200,110 were foreign-born and 87,186 were negroes; (1910) 337,600. The city proper covers only about 10 sq. m. lying between the Anacostia river and Rock Creek, and rising from the low bank of the Potomac, which is here nearly 1 m. wide; above are encircling hills and a broken plateau, which rise to a maximum height of 420 ft. and contain the former city of Georgetown, the villages of Anaotastia, Brightwood, Tennytown, and other suburban districts.

**Streets and Parks.**—The original plan of the city, which was prepared by Major Pierre Charles L'Enfant (1755-1825), under the supervision of President Washington and Thomas Jefferson, was a masterpiece in landscape architecture and in the main it has been preserved. Besides streets running east and west, which are named by the letters of the alphabet, and streets running north and south, which are numbered, there are avenues named for various states, which radiate from two foci—the Capitol and the White House—or traverse the city without any fixed plan. North and south of the Capitol they are numbered; east and west from it streets are lettered, but streets are distinguished by annexing to the letter or lettering the name of the quarter or S.E., and the city is divided into these four parts by North Capitol, East Capitol, South Capitol streets, which intersect at the Capitol. The width of the avenues is from 120 to 160 ft. and the width of the streets from 80 to 120 ft. More than one-half the area of the city is comprised in its streets, avenues and public parks. Among the principal residence streets are Massachusetts, especially between Dupont and Sheridan circles, New Hampshire, Connecticut and Vermont Avenues and 16th Street, all in the N.W. quarter of the city. The principal business streets are Pennsylvania Avenue (especially that between the Capitol and the White House) and 14th, 16th and F streets. Streets and avenues for the most part are paved with a smooth asphalt pavement, and many of them have two and occasionally four rows of overarched shade trees and private lawns on either side. At nearly every intersection of two avenues is a circle or square in which is the statue of some notable American whose name the square bears. At the intersection of a street with an avenue there is usually the reservation of a small triangular grass plot at least. In L'Enfant's plan a park or mall was to extend from the Capitol to the White House. Instead of this the mall extends from the Capitol to the Monument, which stands near the intersection of lines west from the Capitol and south from the White House. In 1901, however, a commission (Daniel Hudson Burnham, C. F. McKim, Augustus St Gaudens and F. L. Olmsted, Jr.) was appointed by authority of the United States Senate to prepare plans for the beautification of the city and this body, seeking in the main to return to L'Enfant's plan, has submitted a design for a park-like treatment of the entire district between Pennsylvania and Maryland Avenues from the Capitol to the White House and between lower New York and Virginia avenue from the White House to the Capitol, with an expanse of 300 ft. wide bisecting the park from the Capitol to the Monument, with a group of official and scientific buildings fronting the mall on either side, with a group of municipal buildings between the mall and Pennsylvania Avenue, and with a Lincoln memorial on the bank of the Potomac. Potomac Park (740 acres), a portion of which is embraced in this design, has already been reclaimed from the Potomac river. On Rock Creek, above Georgetown, is the National Zoological Park (under the control of the Smithsonian Institution), embracing 170 acres in a picturesque site. North of this and extending the boundary of the city was done by Andrew Ellicott (1754-1820), a civil engineer, who had been employed in many boundary disputes, who became surveyor-general of the United States in 1792, and from 1812 till his death was professor of mathematics at the United States Military Academy at West Point.

District, and including both banks of Rock Creek, with its wild and picturesque beauty, is a tract of 1600 acres, known as Rock Creek Park.

The Climate of Washington is characterized by great humidity, long-continued and somewhat oppressive heat in summer, and mild winters. During a period of thirty-three years ending December 1903 the mean winter temperature (December, January and February) was 35° F. (January and February, 32° F., July and August) 75°; the mean of the winter minimum was 27°, and the mean of the summer maximum 85°. Extremes ranged, however, from an absolute maximum of 106° to an absolute minimum of 7° F.

There is an average annual precipitation of 45 in., which is quite evenly distributed throughout the year. Although snowstorms are infrequent and snow never lies long on the ground, there is an abundance of snow in the winter; the storm of January, 1886, being the most severe in recent years. Many of the rivers and streams in the vicinity have been drained and their floodwaters are utilized for irrigation. The river, which flows parallel to the Potomac, is nearly 1 m. wide, and forms a scenic branch of the river.

**Buildings.**—In a dignified landscape setting on the bower of a hill that is itself nearly 100 ft. above the Potomac stands the Capitol (built 1793-1827; architect, William Thornton (d. 1827), superintended by J. H. Latrobe and Charles Bulfinch; wings and dome added 1851-1865). It consists of a central building of Virginia sandstone, flanked when necessary by two wings of white Massachusetts marble. Its length is 751 ft. and its breadth ranges in different parts from 121 to 324 ft. The main building is surmounted by an iron dome, designed by Thomas Ustie Walter, which rises to a height of 268 ft., and is 141 ft. in diameter at its base. The interior contains the Senate chamber, the House of Representatives, the Library of Congress, the Supreme Court, the House wings and the Senate wings. The building is in the form of a Greek cross and has a portico in front with a semicircular pediment. The Library of Congress is the largest in the world, containing upwards of 8,000,000 volumes. The Government Office Building is an imposing brick edifice (completed 1908) with a distinguished portico and large dome. Thevasa-Burrington and the present office of the Department of the Navy are also notable.

The Executive Mansion, more commonly called the White House, the official residence of the president, is a two-story building of Virginia freestone, painted white since 1814 to hide the marks of the snowstorms which have raged against it for years. At the West front are the wings built during the administration of George Washington. The East wing was built during the administration of John Adams; the South wing, during the administration of Andrew Jackson; and the North wing, during the administration of Thomas Jefferson. The East and West wings have porticoes supported by columns, and the North wing has a Doric portico, supported by columns joined by a pediment.

The Smithsonian Institution, the first national institution for the improvement of the arts and sciences, was founded in 1846, and is located in a building (1855) designed by Robert Mills (1781-1855). The museum contains a vast collection of scientific and historical objects, including paintings, statuary, and models. The national capital has several other important buildings, including the United States Supreme Court, the Federal Hall, the Library of Congress, and the National Archives. The Washington Monument, a tall obelisk, was built in honor of George Washington and stands in the middle of the Mall. The White House, the residence of the President of the United States, is one of the most famous buildings in the world. The Jefferson Building of the Library of Congress is a beautiful example of American architecture. The United States Capitol, prominently located in the center of the city, is a magnificent edifice. The Lincoln Memorial, dedicated to the memory of Abraham Lincoln, is a large monument set in the Mall. The United States Supreme Court Building is a beautiful example of American architecture. The National Cathedral, also known as Washington National Cathedral, is a magnificent example of Gothic Revival architecture. The National Archives Building, which houses the National Archives, is a beautiful example of American architecture. The Washington Monument, dedicated to the memory of George Washington, is a tall obelisk.

The United States Capitol, designed by Thomas Jefferson and James Hoban, was completed in 1800 and is the third building on the site. The current building was completed in 1859 and is the most famous building in Washington. The National Cathedral, designed by George Washington, is the largest cathedral in the United States and is located in the center of the city. The United States Supreme Court Building, designed by Cass Gilbert, was completed in 1935 and is a beautiful example of American architecture.

WASHINGTON

interior courts are of Maryland granite and white enamelled bricks. The arcades and second-storied doorways without, and the interior elaborately decorated with paintings, sculpture, coloured marbles and gilding. Two squares north of the Senate office-building is the Union Station, built in 1845 by 80 ft.; cost, $4,900,000. Designed by Daniel Hudson Burnham, consisting of a main building of white granite (from Bethel, Vermont) and two wings, and facing a beautiful plaza. On Pennsylvania Avenue, north of the Capitol Hill is the White House, the old nine-storey Post Office (1899; with a tower 300 ft. high), housing the United States Post Office Department and the City Post Office. A few squares north of it are the General Land Office, the building housing the largest public document (a copy of the Patent Office), with Doric portico; the Pension Office, in which the Inauguration Ball is held on the evening of each president's taking of office; the Government Printing Office (within a few tall office-buildings in the city); the City Hall, or District Court House; and the District Building (1908), another building of the local government. On the heights north of Georgetown is the United States Naval Academy, the best-equipped institutions of the kind; from it Washington time is telegraphed daily to all parts of the United States. Near Rock Creek, west of Georgetown, is the Signal Office and headquarters of the United States Weather Service. In the Mall are the building of the Department of Agriculture, the Smithsonian Institution (q.v.), the National Museum (1910), the Army Medical Museum and the Bureau of History, the latter bearing a fine collection of paintings, statuary, and engravings, and a magnificent building of white marble and cement. On the north side of the Mall, facing the United States Capitol is a section of the Mall, a gray granite building with Doric portico, the official residence of the President of the United States. In the Mall is the United States Capitol, a huge, somewhat more elaborate building of the same style as the Senate office (q.v.) and the Treasury Building. The Capitol was occupied by the government in 1857.

A bronze fountain, "The Court of Neptune," in front of the Library of Congress, is by Hutton Perry. Granite bust portraits of great authors occupy niches in windows near the entrance; these are by S. H. Hartley, Herbert Adams and F. W. Ruckstuhl. The allegorical figures of "Liberty," "Science," "Politics," "Literature" and "Science" are by Olin Warner and Frederick MacMonnies. Among the mural paintings are series by John W. Alexander, Kenyon Cox, E. H. Blashfield, Henry Oliver Walker (b. 1833), Walker McEwen, Elie Hébert, Henry Mosler (E. H. Houdon's) and George G. Lewis (b. 1825). George Willoughby Maynard (b. 1843), Robert Reid (b. 1862), George R. Barse, Jr. (b. 1861), W. A. Mackay, F. W. Beers, J. V. Wilson, W. T. Shinn (1858), Gari Melchers (b. 1860), W. De L. Dodge (b. 1867) and others. The statues are by Abbott Thayer, John Gourley, H. H. Rogers (b. 1875), and others.

The site is said to have been chosen by Washington himself—Congress had planned a marble monument in 1783. In 1833 the Washington National Monument Society was formed and a petition for subscription was taken. The obelisk was designed by Robert Mills, whose original plan included a "Pantheon" 100 ft. high with a colonnade and a colossal statue of Washington. After 1877 the work was carried on by an appropriation made by Congress. See Frederick L. Harvey, History of the Washington Monument and the National Monument Society (Washington, 1893).

one of General George B. McClellan, by Frederick MacMonnies; and statues of Lincoln, by Scott Flannery and (in Lincoln Park) Thomas Ball, of Joseph Henry (by W. W. Story) in the grounds of the Smithsonian Institution, of John Marshall (by Story) on the steps of the building of the United States Supreme Court, by Clark Mills; and, in Lafayette Square, of the Marquis de Lafayette (by F. Haim) and of Baron von Steuben (1891). In Pennsylvania Avenue, at the west end of the Patent Office Building, is the Memorial to the 35,000 officers and men who died in the Civil War, a stone obelisk, 208 ft. high, in memory of officers, seamen and marines of the U.S. Navy killed in the Civil War.

Cemeteries.—On the opposite side of the Potomac, in Virginia, are the National Cemetery, on the grounds of the Capitol, of General Andrew Jackson (by Clark Mills) and, in Lafayette Square, of the Marquis de Lafayette (by F. Haim) and of Baron von Steuben (1891). In Pennsylvania Avenue, at the west end of the Patent Office Building, is the Memorial to the 35,000 officers and men who died in the Civil War, a stone obelisk, 208 ft. high, in memory of officers, seamen and marines of the U.S. Navy killed in the Civil War.

The City Hall, a magnificent building of marble and granite, is the official residence of the President of the United States. The Capitol, a huge, somewhat more elaborate building of the same style as the Senate office (q.v.) and the Treasury Building. The Capitol was occupied by the government in 1857.

A bronze fountain, "The Court of Neptune," in front of the Library of Congress, is by Hutton Perry. Granite bust portraits of great authors occupy niches in windows near the entrance; these are by S. H. Hartley, Herbert Adams and F. W. Ruckstuhl. The allegorical figures of "Liberty," "Science," "Politics," "Literature" and "Science" are by Olin Warner and Frederick MacMonnies. After 1877 the work was carried on by an appropriation made by Congress. See Frederick L. Harvey, History of the Washington Monument and the National Monument Society (Washington, 1893).

A Lincoln memorial is to be erected on the Mall W. of the Washington monument.

The name was changed when the offer of the George Washington Memorial Association to build a $500,000 memorial building was accepted.
and Sciences with a graduate department (1893), a College of the Political Sciences (1907), Washington College of Engineering, divisions of architecture and education (1907), a Department of Law (first organized in 1826; closed in 1827; reorganized in 1865), a Department of Fine Arts (1885), and the public school system (established by Act of Congress, 1862), with several affiliated hospitals, a Department of Dentistry (1887), the National College of Pharmacy (united with the National Pharmaceutical Society in 1891), and the National School of Science. In 1900 this University had 185 instructors and 1,520 students. Georgetown University is in Georgetown (q.v.). The Catholic University of America (incorporated 1887; opened 1889), with buildings near the Potomac, publishes the Catholic Historical Review, the Catholic University of America Press, and the Catholica. The Roman Catholic colleges in the Catholic schools in America. Although designed especially for advanced theological studies, it comprises a School of the Sacred Sciences, a School of Philosophy, a School of Letters, a School of Philosophy of Science, and a School of Social Sciences, a School of Jurisprudence, a School of Law and a School of Technological Sciences. In 1909 its faculty numbered 42 and its students 1,000. The Catholic University plans to maintain the Marist houses, and Trinity College for girls are affiliated with the Catholic University. The American University (chartered 1893), under Methodists Episcopal control, designed to bear a relation to the Protestant churches similar to that of the Catholic University to the Catholic Church, with a campus of 94 acres at the north-west end of the city, in 1910 had not been opened to students. Howard University (1867), for the higher education of negroes, is situated south of the Potomac River. The University was founded in 1867 by General Oliver Otis Howard, one of its founders and (in 1869-1873) its president; it has a small endowment, and is supported by Congress. Another institution is the University of the District of Columbia (1871). It comprises the academy, a college of arts and sciences, a teachers' college, a school of theology, a school of law, a school of medicine, a pharmaceutical college, a dental college, a school of pharmacy, and a school of technology. The Washington Commercial College (1909) had 121 instructors and 1,523 students. The Columbia Institution for the Deaf and Dumb (see Deaf and Dumb, Institutions for, U.S.) was a school for deaf and dumb children, composed of Kendall school (a secondary school) and of Gallaudet College (called in 1864-1893 the National Deaf Mute College; the present name is in honour of Dr T. H. Gallaudet); it was the first institution to give collegiate courses to the deaf, and it is maintained by Congressional appropriations, though it is a private foundation. Washington has also several academies, seminaries and small colleges; among the latter are St John's College (Roman Catholic, 1871), which is open to both male and female students, and the College of St Mary, founded in 1851. The Washington College of Law (1896) is an evening school especially for women. A School of Art is maintained in the Corcoran Gallery of Art.

The Carnegie Institution of Washington, founded by Andrew Carnegie in 1902 and endowed by him with $22,000,000 ($10,000,000 in 1902; $12,000,000 later), is designed "to encourage in the brotherhood of nations, the progress of knowledge and its application to the improvement of mankind; and in particular to conduct, endow and assist investigation in any department of science, literature, or art, and to this end to form self-supporting institutions, boards, and societies, and give endowments to schools, learned societies and individuals; to appoint committees of experts to direct special lines of research; to publish and distribute documents; to give grants in aid of specific investigations; to establish and maintain a library. It is under the control of a board of twenty-four trustees, vacancies in which are filled by the remaining members. In 1908 ten departments had been organized: Botanical Research, with a "desert laboratory" (1903) at Tucson, Arizona; Economics and Sociology (1904); Experimental Evolution, with a station (1904) at Cold Spring Harbor, New York (see HUNTINGTON, N.Y.); Geophysical Research, with a laboratory (1906-1907); Geology—investigations have been carried on by the U.S. Geological Survey and at McGill University, Toronto; Historical Research (1903); Marine Biology, with a laboratory (1904) at Annapolis, Md., and work in Ohio, Florida and the Carolinas, especially at Dudley Observatory, Albany, New York; Research in Nutrition, with a laboratory (1906) at Boston, Massachusetts—investigations (1904) had been carried on at Yale and Wesleyan universities; Solar Physics, with observatories (1909) on Mount Wilson, California, and workshops at Pasadena, California, and Terrestrial Magnetism (1903; headquarters in Washington); the institution had assisted Luther Burbank in his horticultural experiments since 1903, and had published the Index Medicus since 1903; and it makes occasional grants for minor research and tentative investigations. The several societies of Washington are at a large degree more national than local in their character; among them are: the Washington Academy of Sciences (1868), a "federal head" of most of the local bodies; the American Ethnological Society (founded 1879; incorporated 1887), which has published Proceedings (1879 sq.), with the co-operation of the Smithsonian Institution) and The American Anthropologist (1888-1898; since 1898 published by the American Anthropological Association); the National Geographic Society (1888), which since 1903 has occupied the Hubbard Memorial Building, which sent scientific expeditions to Alaska, Mont Pelée and La Souffrière, and which publishes the National Geographic Magazine (1888 sqq.), National Geographic Monographs (1895) and various special maps; the Philosophical Society of Washington (1871; incorporated 1901), devoted especially to philosophical studies; the National Audubon Society (a separate group), which publishes Proceedings (1880 sqq.); the Botanical Society of Washington (1901); the Geological Society of Washington (1893); the Water Resources and Geographical Society (1897); the American Association for the Advancement of Science (1874; Proceedings 1884 sqq.); the Chemical Society (1881); the Records of the Past Exploration Society (1901), which publishes Records of the Past (1902 sqq.); the Southern History Association (1896); and the Military Historical Society of America (1905).

Communications.—Seven railways enter the city: the Philadelphia, Baltimore & Washington division of the Pennsylvania System, the Baltimore & Ohio, the Southern, the Cynsaye & Ohio, the Washing- ton & Alexandria & Mt Vernon. Steamboats ply daily from the foot of Seventh Street to Alexandria, Mt Vernon, Old Point Comfort and Norfolk, and at Old Point Comfort there is connexion with boats for New York. There is also an omnibus service to Alexandria, and at irregular intervals there are boats direct to Balti- more, Philadelphia, New York and Boston. The street railways, and tramcars, by which the residents, with their outlying and suburban dwellings, are conveyed to and from the city, and the suburbs, connect at several points with interurban railways in Maryland and Virginia.

Industries.—The city's manufactures and commerce are of little importance; the capital is devoted more to manufactures and manufactures for local consumption are all at large. In 1905 the government's printing and publishing cost $5,993,906; its ordnance and ordnance stores (in the Navy Yard on the bank of the Anacostia river), $5,331,59; and its engraving and plate printing, $3,499,57. The total value of the products of all the factories in the District which were operated under private ownership (including the Flour Milling operations, which were conducted for the United States) was approximately $182,000,000. This sum, which was returned by the Commissioner of Internal Revenue, was the value of printing and publishing, bread and other bakery products, gas and hotel liquors.

Government.—Washington is the seat of the federal government of the United States and as such is not self-governed, but governed by the Federal Congress. The city was chartered in 1801 and has, as such, no judicial jurisdiction over the District of Columbia. As a national government it has no legislative power. Only its population is 150,000. Only one-half the expenses of the government of Washington is paid
by the District of Columbia and one-half by the United States. The revenue of the District, which is derived from a property tax and from various licences, is paid into the United States Treasury; appropriations, always specific and based on estimates prepared by the commissioners, are made only by Congress; and all accounts are audited by the Treasury Department.

The government owns the waterworks, by which an abundant supply of water is taken from the Potomac at the Great Falls, conducted for 12 m. through an aqueduct 9 ft. in diameter and filtered through a sand filtration plant.

The government of the District has been uniformly excellent, and the laws therefor have been modern in their tendency. The employment of children under fourteen years of age in any factory, workshop, mercantile establishment, store, business office, telegraph or telephone office, restaurant, hotel, apartment house, club, theatre, bootblack stand, or in the distribution or transmission of merchandise or messages is forbidden, except that a child between twelve and fourteen years of age may with the permission of the judge of the juvenile court be employed at an occupation not dangerous or injurious to his health or morals if necessary for his support or for the assistance of a disabled, ill or invalid parent, a younger brother or sister, or a widowed mother. No child under fourteen years of age may be employed in any work whatever before six o'clock in the morning, after seven o'clock in the evening, or during the hours when the public schools are in session.

History.—During the War of Independence Philadelphia was the principal seat of the Continental Congress, but it was driven thence in 1778 by mutinous soldiers, and for the succeeding seven years the discussion of a permanent site for the national capital was characterized by sectional jealousy, and there was a strong sentiment against choosing a state capital or a large city lest it should interfere with the Federal government. The Constitution, drafted in 1787, authorized Congress "to exercise exclusive legislation in all cases whatsoever, over such district (not exceeding 10 sq. m.) as may, by cession of particular states, and the acceptance of Congress, become the seat of government of the United States." Virginia and Maryland promised such a cession and both held conventions to choose a site of a site on the Potomac, and in July 1790 Alexander Hamilton, in return for Thomas Jefferson's assistance in passing the bill for the assumption of the state war debts by the Federal government, helped Jefferson to pass a bill for establishing the capital on the Potomac, by which the president was authorized to select a site anywhere along the Potomac between the Eastern Branch (Anacostia) and the Conococheague river, a distance of about 80 m., and to appoint three commissioners who under his direction should make the necessary surveys and provide accommodations for the reception of Congress before the 1st of October, 1800. Thomas Jefferson (1752-1814) and Daniel Carroll (1756-1829) of Maryland and Dr. David Stuart of Virginia—gave the city its name; Major L'Enfant drew its plan, and Andrew Ellicott laid it out. When, in 1800, the government was removed to Washington it was "a backwoods settlement in the wilderness"; as a city it existed principally on paper, and the magnificence of the design only served to emphasize the poverty of the execution. One wing of the Capitol and the President's House were nearly completed, but much of the land surrounding the Capitol was a marsh. There were years when the roads were very bad, and the members of Congress were obliged to lodge in Georgetown. For many years such characterizations as "Wilderness City," "Capital of Miserable Huts," "Capital of Streets without Houses," "City of Magnificent Distances" and "A Mudhole almost Equal to the Great Serbonian Bog" were common. Resolutions were frequently offered by some disgusted member of Congress for the removal of the capital. In 1814, during the second war with Great Britain, the British, after defeating on the 24th of August an American force at Bladensburg, Prince George county, Maryland, about 6 m. N.E. of Washington, occupied the city and burned the Capitol, the President's House, some of the public offices, and the Navy Yard. In the following year when a bill appropriating $500,000 for rebuilding was before Congress it met with formidable opposition from the "capital movers." The question of removal was again to the front when, in 1848, the Virginia portion of the District was retroceded to that state in response to the appeal of Alexandria, which had suffered from the neglect of Congress. The lethargy of the nation toward its capital suddenly vanished at the outbreak of the Civil War. At the close of the first day's bombardment of Fort Sumter (April 12th, 1861) Leroy P. Walker (1817-1884), the Confederate Secretary of War, boasted that before the 1st of May the Confederate flag would float over the Capitol. The North, alarmed at the threat, speedily transformed Washington into a great military post and protected it on all sides with strong earthworks. Throughout the war it was the centre of the military operations of the North: here the armies were officered and marshalled, from here they marched on their campaigns against the South, here they rested their force after the longest duration of any war. Several hospitals for the care of the wounded. Although several times threatened by the South, Washington was never really in danger except in July 1864 when General Jubal A. Early advanced against it with 12,000 veterans, defeated General Lew Wallace with about 3500 men at Monocacy Bridge on the 6th, and on the 11th appeared before the fortifications, which were at the time defended by only a few thousand raw troops; the city was saved by the timely arrival of some of Grant's veterans. In the city, on the 23rd and 24th of May 1865, President Abraham Lincoln reviewed the returning soldiers of the Union Army.

The population of Washington increased from 61,122 to 100,190 or 78.6% in the decade from 1860 to 1870, and the stirring effects of the Civil War were far-reaching. The city had been founded on too elaborate and extensive a plan to be left to the initiative and unaided resources of its citizens. But under the new form of government which was instituted in 1871 a wonderful transformation was begun under the direction of Alexander R. Shepherd (1835-1902), the governor of the District and president of the board of public works. The Tidal Basin financial embarrassment followed, but when the Federal government had taken upon itself half the burden and established the economic administration of the commissioners, the problem of beautifying the nation's capital was solved.

WASHINGTON, a city and county-seat of Daviess county, Indiana, U.S.A., about 50 m. N.E. of Evansville. Pop. (1890) 6064, (1900) 8551, of whom 391 were foreign born and 255 negroes, (1910 census) 11,404. It is served by the Baltimore & Ohio and Ohio Southern Western (which has repair shops here) and the Evansville & Indianapolis railroads. The city has a public library and a city park of 14 acres. It is the center of the surrounding farming, stock-raising and coal-mining region, and there are deposits of kaolin and fireclay in the vicinity. The total value of the factory product in 1905 was $1,166,749 (48.6% more than in 1900). The municipality owns and operates the electric lighting plant. Washington was settled in 1816 and chartered as a city in 1870.

WASHINGTON (or Washington Court House), a city and the county-seat of Fayette county, Ohio, U.S.A., on Paint Creek, 35 m. S.E. of Springfield. Pop. (1880) 3789, (1890) 5744, (1900) 5778 (708 negroes); (1910) 7377. It is served by the Baltimore & Ohio, the Cincinnati & Muskingum Valley (Pennsylvania Lines), the Detroit, Toledo & Ironton, and the Cincinnati, Hamilton & Dayton railways. It is in a rich farming and stock and poultry-raising region, has a large poultry-packing house and various manufactures. Washington, or Washington Court House as it is often called to distinguish it from the
village of Washington in Guernsey county, Ohio, was laid out in 1810 and was chartered as a city in 1888.

WASHINGTON, a borough and the county-seat of Washington county, Pennsylvania, U.S.A., about 23 m. S.W. of Pittsburg and about 30 m. N.E. of Wheeling, West Virginia, on Chartiers Creek; Washington was 500, of whom 455 were foreign-born and 684 were negroes; (1910) 18,728. Washington is served by the main line of the Baltimore & Ohio, the Chartiers Valley branch of the Pittsburg, Cincinnati, Chicago & St Louis (Pennsylvania system) and the Waynesburg & Washington railways and a connecting line for freight service, and by electric railway to Pittsburg. Among its public buildings and institutions are the county court-house (in which are the rooms of the Washington County Historical Society), the Federal building, two hospitals, a Y.M.C.A. building and a public library. It is the seat of Washington and Jefferson College, of Washington Seminary (1836) for girls and of a school of business. Washington and Jefferson College was incorporated, in 1865, by the consolidation of two rival institutions, Washington Academy and Jefferson College. Washington Academy (incorporated in 1782) and endowed by the legislature of Pennsylvania, which was opened in 1789, was incorporated as Washington College in 1806, and in 1832 became a synodical college of the Presbyterian Church, under the direction of the synod of Wheeling. Jefferson College, which was an outgrowth of Canonsburg Academy at Canonsburg, 7 m. from Washington, was chartered in 1794, and incorporated as Washington College in 1838. The Medical College of Philadelphia was its medical department. In 1896, by an act of the legislature, all departments were located at Washington. In 1872 a chair of engineering and applied mathematics and one of biology were established with an endowment of $40,000, the gift of Dr Francis J. LeMoyne, and the chair of Greek and of Latin was endowed by the Rev. C. C. Beatty with $60,000. In 1909-1910 Washington and Jefferson College (including Washington and Jefferson Academy) had 29 instructors, 413 students, about 20,000 volumes in its library, and an endowment of $2,600,000. Washington is in a hithertounknown coal and natural gas region, and there are manufactories of glass, iron tubing and pipe, tin plate, steel, &c. The site was part of a tract bought in 1771 by David Hoge and was known at first as Catfish camp after an Indian chief, Tingoqua or Catfish. It was platted in October 1781 and called Bennettstown in honor of Richard Bassett (d. 1815), a member of the Federal constitutional convention of 1787 and of the United States Senate in 1789-1793, and governor of Delaware in 1798-1801. The village was replatted in November 1784 and renamed in honor of George Washington who, before from a large part of the site had belonged. The early settlers were chiefly Scotch-Irish. At first a part of Strabane township, one of the original townships of Washington county, in February 1786 Washington was made a separate election district; it was incorporated as a town in 1812, was chartered as a borough and enlarged in 1832, and its limits were extended in 1854 and 1855. Since 1900 there have been added to the borough North and South Washington and the industrial suburb of Tyrlerdale, East and West Washington, although practically one with the borough, remaining under separate administration. The location of Washington and of the railroad gave it importance long before the advent of railways. At the LeMoyne crematory established here by Dr Francis Julius LeMoyne, on the 6th of December 1876, took place the first public cremation in the United States; the body burned was that of Baron Joseph Henry Louis de Palm (1809-1876), a Bavarian nobleman who had emigrated to the United States in 1862 and had been active in the Thespeian Society in New York.

LeMoyne (1798-1879) was the son of a French refugee, and was an ardent abolitionist. In 1840 he was the Liberty party's candidate for the vice-presidency on a normal school of negroes near Memphis, Tennessee, and gave the name of Washington College, at which he had graduated in 1815. Largely through LeMoyne's influence Washington became an important point on the "underground railroad" for assisting runaway slaves to Canada.

WASHINGTON, the most north-western state of the United States of America. It lies between latitudes 45° to 49° N. and between longitudes 116° 57' and 124° 48' W. On the N. it is bounded by British Columbia, along the 49th parallel as far W. as the middle of the Strait of Georgia and then down the middle of this strait and Haro Strait, and along the middle of the channel of the Strait of Juan de Fuca, which separate it from Vancouver Island; on the E. the south portion of its boundary is the Snake river, a tributary of the Columbia, which separate it from Oregon; on the S. the Columbia river separates it from Oregon; and on the W. the state is bounded by the Pacific Ocean. The state has a maximum length, from E. to W., of 360 m. and a maximum width of 240 m.; area, 60,177 sq. m., of which 2,925 sq. m. are water surface.

Physical Features.—The western half of Washington lies in the Pacific States; the eastern portion forms part of the Cascade range, separated by a broad basin known as the Sound Valley. The eastern half of the state is occupied in the north by a westward extension of the Rocky Mountains, and in the centre and south by the north-western portion of the Columbia Plateau. The most prominent physical feature of the state is the Cascade mountain range, which with a N.N.E. and S.S.W. trend crosses the state from 40 m. to 50 m. It is the highest of the range, and the mountain range occupies a tract about 50 m. in width, and to the northward it widens to 100 m. or more. The general height of the ridge and peaks is about 8000 ft. above the sea, but there are five prominent volcanoes which equal or exceed 10,000 ft. These are Mount Rainier or Tacoma (14,936 ft.), Mount Adams (12,770 ft.), Mount Baker (10,630 ft.) and Mount St Helens (15,000 ft.). Glaciers are common both in the N. and in the S. region, even on the higher elevations. Both slopes of the Cascades are cut deep by valleys. Along the Pacific Coast the ridges of the Coast range are only about 1500 ft. in height in the S. part of the state, but they rise northward in the Olympic Mountains and reach a maximum of elevation on Mount Olympus of 8190 ft. The Olympics meet the ocean along a rather straight line, but farther S. the coast line is broken by Gray's Harbour and Willapa Bay. Washington was bounded lower on the S. by the Coos and Columbia rivers which enclose the Willamette Valley, an extension of the Willamette Trench, and the Cascade Mountains on the E. and the Olympic Mountains and Coast range on the W. left between them the Puget Sound Basin, the gently sloping sides of which descend in the central portion to about 1500 ft. from sea-level. A still greater submergence north produced Puget Sound. East of the Cascade Mountains the Columbia and Spokane rivers mark the boundary between the state and Idaho, and are followed to the southward. The Okanogan Highlands, an outlier of the Rocky Mountains extending westward from the Cœur d'Alene Mountains in Idaho, reach heights of 5000 to 6000 ft. above the sea, but are characterized by long gentle slopes, rounded divides and wide stream basins. In some of the larger valleys there are glacial terraces. The Columbia plateau consists of horizontal beds of lava having a total thickness of several thousand feet, and its surface has a general elevation of 1000 to 2000 ft. above sea-level. West of the Columbia river the plain is broken by several monoclinal ridges rising 2000 to 3000 ft. above it and extending eastward 50 to 75 m. The prairies of the Puget Lowland are made up of some parts, especially in Douglas and Grant counties) within the Big Bend of the Columbia, the plain is frequently cut by canyons, or abandoned river channels, some of them 500 to 600 ft. deep and with very precipitous walls. The Okanogan river, which enters the Columbia from the N.E., is shut off during the glacial period, when its regular channel was blocked with ice. There are also several canyons which have been cut by the rivers through the mountainous areas which separate the Snake river and its tributaries. The S.W. corner of the state is occupied by mountains, which rise about 7000 ft. above the sea and are cut deep by canyons. About 11,000 sq. m. in Washington have a maximum elevation less than 500 ft. and the mean elevation of the entire state is 1700 ft. The Okanogan Highlands, the Columbia plain, the E. slope of the Cascades, and the outer portions of the Puget Lowland are drained by the Columbia and its tributaries. This large river enters the N.E. corner of the state from the N., traverses it in a winding course from N. to S., forms the greater portion of its S. boundary, and discharges into the Pacific Ocean. The Snake (in
the S.E., a little W. of the 119th parallel), the Spokane (in the east central part) and the Pend Oreille (on the N. boundary) are their principal tributaries from the E.; the Yakima (a little above the mouth of the Snake River, on the W.) and the Okanogan (on the Okanogan River, south of the state), from the N. A portion of the Puget Sound Basin and a portion of the Coast range are drained by the Chehalis river, which has cut a channel through the Coast range and discharges into Puget Sound at Harbot. The Columbia river, along with most of the E. slope of the Olympics and the N. portion of the Puget Sound Basin are drained by a great number of small rivers into the Puget Sound; and the W. slope of the Olympics and Coast range are drained by several other streams into Puget Sound. But the Cascade Mountains, at the heads of streams, are a number of lakes of glacial origin, the largest of which is Lake Chelan on the E. slope of the Cascades. This is 24 ft. deep and about 14 mi. wide. At the upper end it is about 1400 ft. deep, but it is shallow at the lower end where the water is held back by a morainal dam, and where only 33 ft. from the Columbia river it is about 400 ft. deep. The is a quite number of lakes on and near the Cascades. The destruction of cougars, lynx ("wildcats") coyotes and wolves is encouraged by bounty. Coyotes and jack-rabbits are the most numerous denizens of the Columbia plains. Muskrats and beavers are most abundant west of the Cascade range, and partridge and prairie-chickens are the principal game birds. The sage-hen is common on the Columbia plain. The Japanese pheasant and the California quail have increased in numbers under the protection of the state. Army antelope, black-tailed deer, and black bear are usually seen on the Olympic Peninsula. The habit of the otter is found on the lower Columbia river, in Gray's and Willapa harbours, and in Puget Sound; oyster fisheries in Gray's and Willapa harbours and in Puget Sound; cod, perch, and flounder in the Puget Sound; and salmon, whitefish, lake trout, and sturgeon on the Columbia river. The fisheries of the state are of great importance. The salmon run in the river and on the Columbia is about 40,000,000. The Columbia river is navigable for 500 miles from its mouth;

Fauna.—Many species of wild animals still inhabit the state, but the number of each species has been much reduced. The caribou, moose, antelope, mountain sheep, beaver, otter and mink are scarce. Few elk are found except in the inaccessible districts on the Olympic Mountains. White- and black-tailed deer and black bear inhabit the eastern, and the black-tailed deer the western part of the state. The black-capped chickadee and the Oregon jay are the only birds of significant abundance. The Columbia plains are inhabited by the bobcat, the lynx, the coyote, and the black-tailed deer. The sage-hen is common on the Columbia plain. The Japanese pheasant and the California quail have increased in numbers under the protection of the state. Army antelope, black-tailed deer, and black bear are usually seen on the Olympic Peninsula. The habit of the otter is found on the lower Columbia river, in Gray's and Willapa harbours, and in Puget Sound; oyster fisheries in Gray's and Willapa harbours and in Puget Sound; cod, perch, and flounder in the Puget Sound; and salmon, whitefish, lake trout, and sturgeon on the Columbia river. The fisheries of the state are of great importance. The salmon run in the river and on the Columbia is about 40,000,000. The Columbia river is navigable for 500 miles from its mouth;

Flora.—The Puget Sound Basin and the neighboring slopes of the Olympic Mountains are the most forested for their forests, consisting mainly of giant Douglas fir or Oregon pine (Pseudotsuga Douglasii), but containing also some cedar, spruce, and hemlock, a smaller representation of a few other species and a dense undergrowth. Near the Pacific Coast the forests consist principally of hemlock, cedar and Sitka spruce. At an altitude of about 3000 ft. on the W. slope of the Cascades the red fir ceases to be the dominant tree species. The upper limit of the region of evergreen forests is on a few of the highest peaks, rise a succession of forest zones, containing principally: (1) yellow pine, red and yellow fir, white fir and cedar; (2) lodgepole pine, white pine, Engelmann spruce and yellow pine; (3) lodgepole pine, fir, oak and fir; (4) Douglas fir and cedar and tamarack; (5) white-bark pine, Patent hemlock, alpine larch and creeping juniper. Deciduous trees and shrubs are represe. The Columbia plains are inhabited by the bobcat, the lynx, the coyote, and the black-tailed deer. The sage-hen is common on the Columbia plain. The Japanese pheasant and the California quail have increased in numbers under the protection of the state. Army antelope, black-tailed deer, and black bear are usually seen on the Olympic Peninsula. The habit of the otter is found on the lower Columbia river, in Gray's and Willapa harbours, and in Puget Sound; oyster fisheries in Gray's and Willapa harbours and in Puget Sound; cod, perch, and flounder in the Puget Sound; and salmon, whitefish, lake trout, and sturgeon on the Columbia river. The fisheries of the state are of great importance. The salmon run in the river and on the Columbia is about 40,000,000. The Columbia river is navigable for 500 miles from its mouth;

Climate.—In western Washington, where the ocean greatly influences the climate and the mountains condense the moisture of vapour-bearing winds, the climate is equable and moist. Eastern Washington, too, usually has a mild temperature, but occasionally some regions in this part of the state are visited by continental extremes, and as the winds from the ocean lose most of their moisture in passing over the Cascades, the climate is either dry or arid according to elevation. Along the coast the temperature is rarely above 92° F. at night; the mean temperature for January is about 60°, for January 30°, and for the entire year 50°. In the Puget Sound Basin an occasional cold east wind during a dry period in winter is sufficient to lower the temperature to fall below zero. At Centralia, on the Chehalis Valley, the temperature for January 50°; but the mean temperature for January is 34° in the N. portion of the basin and 40° in the S. portion; for July it is 60° in the north and 55° in the south; and for the entire year it is 46° in the north and 42° in the south. During April and October the temperatures in eastern Washington are nearly the same as those in western Washington, but during July the temperatures in eastern Washington are subject to a range from 40° to 110°, and during January from 65° to 30°. However, the climate is so dry in eastern Washington that the temperatures are not as high as those recorded by the thermometer. In the south-eastern Washington heat waves are mild, with the exception of an occasional cold period, and the summers are hot. The rainfall on the W. slope of the Olympics, the Cascades and the Olympic Peninsula is much larger than in the eastern part of the state. In the Puget Sound Basin it is from 25 to 60 in., being least on the N.E. or leeward side of the Olympics. About three-fourths of the rain in the western Washington falls during the wet season, which extends from December to April inclusive. On the Columbia river the rain falls almost equally throughout the year, but during winter they occasionally blow with great violence. In eastern Washington hot winds from the north or east are occasionally injurious to the growing wheat in June or July. Light hailstorms are common in the eastern part of the state, but they do little injury. The snowfall in eastern Washington is usually sufficient to raise the level of the lakes or chains of alkali lakes in the coulees on the Columbia plateau. Soils.—The soils of western Washington are chiefly glacial, those of eastern Washington chiefly volcanic. In the low tidewater district of the Puget Sound, large exceptions to the glacial origin of the soil occur on the Puget Sound islands and the Olympic Peninsula, along the Pacific coast, and on the Puget marshes. On the Columbia plateau the soil is practically volcanic ash and decomposed lava; it is almost wholly volcanic ash in the more arid districts, but elsewhere it consists of gravel and sand, and some vegetable loam is mixed with the ash. On the E. slopes of the Cascades and the Okanogan Highlands glacial deposits of clay, gravel or sand, as well as vegetable loam, are mixed with the volcanic substances.

Fishes.—Washington's many waterways, both fresh and salt, and especially those which indent or are near the coast, make the fisheries resources of great value. The catch and canning of salmon and halibut are the most important. In 1905 the value of canned salmon was $2,431,605 (26,601,429 lb.).

Forests.—In 1907 the estimated area of standing timber in Wash-ington was 11,720,000 acres. The state now has 39 large state parks (all of which were opened in 1907 and 1908) is 18,850-7 sq. m., or about three-eighths of the total area of the state.

Irrigation.—The principal Federal irrigation undertakings in 1910 were known as the Okanogan project and the Yakima project. The former (authorized in 1905) provided for the irrigation of about 10,000 acres in Okanogan county by means of two reservoirs of an aggregate area of 650 acres, main canals and main laterals 20 m. long and small laterals 30 m. long, the water being taken from the Salmon river. In 1909 about 3000 acres in this project were watered and under cultivation. The Yakima project involved the irrigation of 60,000 acres in the future Yakima river. In 1906 the aggregate area of 800,000 acre-feet, and was undertaken by the United States government in 1905.

Agriculture.—The development of the agricultural resources of Washington was exceedingly rapid after 1880. The wheat crop in 1909 was 35,780,000 bushels, valued at $33,275,000; oats, 9,808,000 bushels, valued at $1,751,000; barley, 7,186,000 bushels, valued at $790,000; Indian corn, 417,000 bushels, valued at $359,000. The principal wheat-producing region is the south-eastern part of the state. Western Washington has large hay crops; in the E. part of the state the hay is mostly harvested in Okanogan county. In 1910 Washington peas were raised for forage.

Vegetable crops are successfully grown in low alluvial lands of the W. part of the state, but the interior lowlands of eastern Washington are too arid for the most part. Apple-growing in the Columbia valley has been a failure, and the raising of other fruits have increased rapidly. Small fruits are more successful in the W. part of the state. Grapes are grown on the mountain sites, and cherries on the hog lands near the coast, and nuts in the S.E. parts.

Live-stock and dairy products are important factors in the
agricultural wealth of Washington, but the raising of live-stock on ranges is less common than when large herds grazed free on government lands. The production from grazing, has much increased in importance in recent years.

Minerals.—The mineral wealth of Washington is large, but its resources have been only slightly developed, and had hardly begun to be explored. Great and valuable deposits of all mineral products was $5,393,659; in 1907 it was $11,617,706 and in 1908 $11,610,224.

The coal deposits of Washington are the only important ones in the state, and in Washington only, of the Pacific states, is there any coking coal. In the Cowlitz Valley an inferior coal was found in 1848. The first important mining was near Bellingham Bay, and in 1853, a deposit of the same was made near the Cedar River. The capacity of the most important was 5,024,943 tons (valued at $6,690,412) in 1898, when nearly one half (1,411,621 tons) of the total was from Kittitas county and most of the remainder from the counties of King (931,635 tons) and Pierce (551,678 tons). There are large deposits of glacial and residual clays and clay shales throughout the state. Serpentine marble with seamcd markings has been found in Adams and Stevens counties. Granite is found about Puget Sound and in the extreme eastern part of the state; it is largely used in riprap on the coast. Sandstone is found in portions of Yakima, N.W. in Whatcom and San Juan counties; it is used for paving blocks. Limestone also is found most plentifully in the north and northwest parts of the state.

Gold, silver, copper, lead and a little iron (almost entirely brown ore) are the principal ores of commercial importance found in Washington. The total value of gold, silver, copper and lead in 1908 was $1,765,646, copper lead $45,318. The largest output of each of these ores in 1908 was in Stevens county; Ferry, King and Okanogan counties ranked next in the output of gold; Okanogan and Ferry counties in the output of silver; King, Okanogan, Kittitas and Chelan counties in the output of copper; and King in the output of lead. About nine-tenths of the gold was got from dry or siliceous ores and about 8% from placer mines; about two-thirds of the silver from dry or siliceous ores, about two-ninths from copper ores. The bulk of the lead ores are galena. The copper is mostly a copper glance passing into chalcocyprite; it is found in fissure veins with galena. A small quantity of zinc (7 tons in 1906) is occasionally produced. Tungsten is found as wolframite in Stevens county near Deer Trail and Bliss, in Okanogan county near Loonis, in Whatcom county near the international boundary, and (with some scheelite) at Silver Hill, near Spokane. Tin has been found in King and Ferry counties, and in molybdenum near Davenport, Lincoln county. There is chromite in the black sands of the sea-coast and the banks of the larger rivers. Antimony deposits were first worked in 1906. Arsenic is found.

Lumbering.—The lumbering industries of Washington between 1880 and 1905, due primarily to the extraordinary development of its lumber industry. In 1870 the output of the state was $1,714,734; in 1880 the output was $5,734,742; by 1905 the value had increased to $30,572,512, and Washington now ranked first. The greatest increase in output has been in the manufacture of planed wood, doors and blinds, an important industry, the products being valued in 1905 at $6,173,422.

Next in commercial importance to lumber and timber products are flour and grit mill products, valued in 1905 at $1,465,612. Other important manufactures are: slaughtering and meat packing (wholesale), $6,251,705 in 1905; malt liquors, $4,471,777; and furniture, $7,374,015.

Transportation and Commerce.—Puget Sound has formed a natural port for several transcontinental railways, the cities of Seattle and Tacoma on its shores affording outlets to the commerce of the Pacific for the Northern United States, and the Chicago, Milwaukee, St. Paul & Pacific, which enter these cities with their own tracks. The Union Pacific and the Canadian Pacific reach Seattle over the tracks of other roads. The Northern Pacific, the first of the transcontinental roads to touch the coast, runs down the eastern side of the state, parallel to the coast road and the Northern Pacific; and paralleling the Great Northern, runs the recently constructed Chicago, Milwaukee & Puget Sound line. The Northern Pacific sends a branch line from Chicago, Ml. incl. to St. Paul. The Northern Pacific serves the coast Portland on the Columbia river, where it meets the Southern Pacific and the Oregon Railroad & Navigation Company's line (a subsidiary of the Union Pacific), thus affording communication southwards, and up the valley of the Columbia to the east. Entering the south-east corner of the state, the Oregon Railroad & Navigation Company extends a line northwards to Spokane, and a branch of the Great Northern, leaving the main line at this city, runs north-westward into British Columbia. The Spokane, Portland & Seattle railway connects the three cities named by way of the Idaho and Montana. The Northern Pacific sends a line eastward into Idaho to the Cœur d'Alene and a line westward, the southern part of the state into Nevada. In 1880 the railway mileage was 398; in 1905, 2,088; in 1900, 1,890. Seattle and Tacoma are among the four leading ports of the United States on the Pacific. Other harbors on Puget Sound of commercial importance are Olympia, Everett and Bellingham. Port Townsend is the port of entry for Puget Sound. Gray's Harbour, on the western coast, is of importance in lumber traffic.

Population.—The population in 1860 was 11,594; in 1870, 23,925; in 1880, 75,116; in 1890, 349,390, an increase within the decade of 365% percent; in 1900, 581,103, an increase of about 45%. In 1910, according to the U.S. census returns, the total population of the state reached 1,141,996. Of the total population in 1900, 394,179 were native whites, 111,384 or 21.5% were foreign-born, 10,139 (of whom 251 were not taxed) were Indians, 2734 were conditional aliens, 32,750 were Mexican citizens, 1,022 were Chinese, 15,777 were Japanese, and 10,428 were other foreign-born. The Indians on reservations in 1900 were chiefly those on Colville Reservation (1,297,000 acres unallotted), in the N.E. part of the state, and the Yakima Reservation (837,753 acres unallotted), in the S. part; they belonged to many small tribes chiefly of the Salishan, Athapascan, Chinookan and Shoshonan stocks. Of the foreign-born, 18,385 were English-Canadians, 16,686 Germans, 12,757 Swedes, 10,481 natives of England, 891 Norwegians and 7,652 Irish. Of the total population 241,388 were of foreign parentage (i.e. either one or both parents were foreign-born), and of these 108,860 or 45% of a given nationality. 34,490 were of German, 10,359 of Swedes, 31,716 of Irish, 16,950 of Norwegians and 16,833 of English parentage. The Roman Catholic Church in 1906 had more members than any other religious denomination, 74,951 out of the total of 191,976 in all denominations; there were 31,700 Methodists, 13,464 Lutherans, 11,316 Baptists, 16,628 Disciples of Christ, 10,223 Congregationalists and 16780 Protestant Episcopalians.

Government.—Washington is governed under its original constitution, which was adopted on the 1st of October 1888. An amendment may be proposed by either branch of the legislature; the initiative and referendum, and recall of elected officials, by the voters. Amendments may be made by two-thirds vote of each house of the legislature, and subsequently, at the next general election, by a majority of the people who vote on the question it becomes a part of the constitution. Five amendments have been adopted: one in 1884, one in 1886, one in 1900, one in 1904, and one in 1910.

Sufrage is conferred upon all adult citizens of the United States (including women, 1910) who have lived in the state one year, in the county ninety days, and in the city, town, ward or precinct thirty days immediately preceding the election, and are able to read and speak the English language; Indians who are not taxed, idiots, insane persons and convicts are debarred. General elections are held biennially, in even-numbered years, on the first Tuesday after the first Monday in November, and candidates, except those for the supreme court bench and a few local offices, are nominated at a direct primary election, held the second Tuesday in September.

The governor, lieutenant-governor, secretary of state, treasurer, auditor, attorney-general, superintendent of public instruction and commissioner of public lands are elected for a term of four years; the members of the administrative board and the Supreme Court, for terms of six years, and the legislature, for terms of two years. The governor's salary is $6000 a year, which is maximum allowed by the constitution.

The legislature consists of a House of Representatives and a Senate and a House of Representatives, and the constitution provides that the number of representatives shall not be less than sixty-three nor more than ninety-nine, and the number of senators not more than one-half nor less than one-quarter of the number of representatives. Senators are elected for single districts for a term of four years, a portion retiring every two years; representatives are elected, one, two or three from a district, for a term of two years. Regular sessions of the legislature are held biennially, in odd-numbered years, and begin on the second Monday
in January. Any bill or any item or items of any bill which has
passed both houses may be vetoed by the governor, and to override
a veto, two-thirds vote of the members present in each house
is required. No law other than appropriation bills can go into ef
fect until ninety days after the adjournment of the legislature, except
in case of a national emergency, or two-thirds vote of the mem-
bers. The members of the legislature are paid $5 for each day's
attendance during the session, besides an allowance for travelling
expenses.

The law is administered principally by a supreme court,
court of appeals, and the courts of civil and criminal juris-
dictions. The supreme court consists of a chief justice and six
judges elected in each district, and the concurrence of a majority
of the judges is necessary to determine any case. The
authority of the judges may be reviewed by the supreme court,
or to the court of civil appeals. The chief justice or any four
of his associates may at any time convene the court of civil
appeals, and if so convened at least five of the judges must be
present, and the concurrence of at least three is necessary to a
decision. The supreme court has original jurisdiction in habeas
corpus, quo warranto and mandamus proceedings against all state officers; and it has appellate
jurisdiction in civil actions for the recovery of personal property, in which
the original amount in controversy does not exceed $200, and which at
the same time do not involve the legality of a tax, imposition, assessment,
toll or municipal line, or the validity of contracts, judgments, or
debts of any county, or for two or more counties jointly are elected
for a term of four years. They have original jurisdiction in all
cases in equity, in all cases at law which involve the title or possession,
or the right to the use of the same or the income derived therefrom,
toll or municipal line, and in all other cases at law in which the
amount in controversy is $100 or more, in nearly all criminal cases, in matters
of valuation of personal property for purposes of taxation or of
valuation in various civil actions, and they have appellate jurisdiction
of cases originally tried before a justice of the peace or other inferior courts
where the amount in controversy is more than $20. Justices of the peace,
one or more in each city or town, are elected for a term of two years.
They have jurisdiction of various civil actions in which the amount in
controversy is less than $100, and concurrent jurisdiction with the
supreme court in cases of minor importance, but not exceeding
$500, imprisonment for six months, and elsewhere a fine of
$100 or imprisonment for thirty days.

Local Government.—The government of each county is vested
principally in a board of three commissioners elected by a county,
and the term for each is for two years. The

...
grades. Washington has three state normal schools: one at Cheney, one at Bellingham, and one at Ellensburg, and each of them is under the management of a board of three trustees appointed by the governor for a term of six years, one every two years. The State College of Washington (1890) at Pullman, for instruction in agriculture, mechanical arts and natural sciences, includes an agricultural college, an experiment station and a laboratory school. The University of Washington (1862) at Seattle embraces a college of liberal arts, a college of engineering and schools of law, pharmacy, mines and forestry. Whitman College (Congrega- tional) at Walla Walla, Gonzaga College (Roman Catholic) at Spokane, Whitworth College (Presbyterian, 1890) at Tacoma and the University of Puget Sound (Methodist Episcopal, 1903) at Tacoma are institutions of higher learning maintained and controlled by religious denominations.

Finance.—The revenue for state, county and municipal purposes is derived principally from a general property tax, a privilege tax levied on the gross receipts of express companies and private circulating libraries, inheritance tax and license fees for the sale of intoxicating liquors. Real property is assessed biennially; personal property, annually. For the two years ending the 1st of October 1908 the total receipts into the state treasury amounted to $10,854,281.42 and the total disbursements amounted to $11,053,375.13. The net state debt on the 1st of October 1908 amounted to $607,576.38.

History.—The early exploration of the western coast of North America grew out of the search for a supposed passage, sometimes called the "Strait of Anian" between the Pacific and the Atlantic. In "Purchas his Pilgrimes" (1625) was published the story of Juan de Fuca, a Greek mariner whose real name was Apostolos Valerianos, who claimed to have discovered the passage and to have sailed in it more than twenty days. Though the story was a fabrication, the strait south of Vancouver Island was named for account of the various Spanish and English explorers who had already been under Oregon and need not be repeated at length here.

In 1787 a company of Boston merchants sent two vessels, the "Columbia" and the "Washington" under John Kendrick and Robert Gray (1755-1806) to investigate the possibility of establishing trading posts. They reached Nootka Sound in September 1788, and in July 1789 Captain Gray in the "Columbia" began the homeward voyage by way of China. Captain Kendrick remained, erected a fort on Nootka Sound, demonstrated that Vancouver was an island and in 1791 purchased from the Indians large tracts of land between 47° and 52° N. lat. for his employers. On the homeward voyage he was accidentally killed and his vessel was lost. Meanwhile Captain Gray in September 1790 sailed from Boston on a second voyage. During the winter of 1791-1792 he built another fort on Nootka Sound and mounted four cannon from the ship. With the coming of spring he sailed southward, determined to settle definitely the existence of the great river, which he had vainly attempted to enter the previous summer. Captain George Vancouver (1759-1790), in charge of a British exploring expedition then engaged in mapping the coast (1790-1794), was sceptical of the existence of the river, but Captain Gray, undiscouraged, persisted in the search and on the 11th of May 1792 anchored in the river which he named Columbia in honour of his ship. The later claim of the United States to all the territory drained by the river was based chiefly upon this discovery by Captain Gray, who had succeeded where Spanish and British had failed. The territory became known as Oregon (q.v.).

The first white man certainly known to have approached the region from the east was Alexander Mackenzie of the Northwest Fur Company, who reached the coast at about lat. 52° in July 1793. With the purchase of Louisiana (4th April 1803, the United States gained a clear title to the land between the Mississippi and the Rocky Mountains as far north as 49° and, because of contiguity, a shadowy claim to the region west of the mountains. In 1810 Spain specifically renounced any claim she might have to the coast north of 42°, strengthening thereby the position of the United States. Just before the purchase of Louisiana, President Jefferson had recommended to Congress (28th January 1803) the sending of an expedition to the headwaters of the Missouri, cross the Rockies and follow the streams to the Pacific. In accordance with the recommendation Meriwether Lewis (q.v.) and William Clark, both officers of the United States Army, with a considerable party left St Louis on the 14th of May 1804, ascended the Missouri to the headwaters, crossed the Rockies and, following the Columbia river, reached the ocean in November 1805. The return journey over nearly the same route was begun on the 23rd of March 1806, and on the 23rd of September they reached St Louis.

The story of the struggle of the rival British and American companies to control the fur trade, with the final dominance by the American, who had been told under Oregon and need not be repeated. Since the country was considered to be of little value the question of boundaries was not pressed either by Great Britain or the United States after the War of 1812, and by a treaty concluded on the 26th of October 1818 it was agreed that "any country that may be claimed by either party on the north-west coast of North America, westward of the Stony (Rocky) Mountains shall be free and open for the term of ten years from the date of the signature of the present convention to the vessels, citizens and subjects of the two powers." On the 5th of August 1827 the convention was continued in force indefinitely with the proviso that the parties might again agree on a line of boundary. Meanwhile Russia (17th April 1824) agreed to make no settlement south of 54° 40' and the United States agreed to make none north of that line. In February 1835 Great Britain and Russia made a similar agreement. This left only Great Britain and the United States as the contestants for that territory west of the Rocky Mountains between 42° and 54° 40', which by this time was commonly known as the Oregon country. American settlers in considerable numbers soon began to enter the region south of the Columbia river, and in 1841, and again in 1843, these settlers attempted to form a provisional government. A fundamental code was adopted in 1845 and a provisional government was established, to endure until "the United States of America extend their jurisdiction over us." North of the river, the Hudson Bay Company discouraged settlement, believing that the final determination of the boundary controversy would make that stream the dividing line. Though there were a few mission stations in the eastern part of the present state of Washington (see WHITMAN, MARCUS), the first permanent American settlement north of the Columbia was made in 1845 on the Des Chutes river, at the foot of Puget Sound at the present city of Oregon City. The Oregon Treaty of 1846 followed in spite of the efforts of the chief factor of the Hudson's Bay Company, Dr John M'Loughlin, and these permanent settlers finally carried the day.

Interest in the Oregon country developed with the increase of settlers and of knowledge and a demand for the settlement of the boundary dispute arose. The report of Captain Charles Wilkes, who visited the coast in 1841-1842 in charge of the United States exploring expedition helped to excite this interest. In the presidential campaign of 1844 one of the Democratic demands was "Fifty-four forty or fight." By a treaty negotiated by James Buchanan, on the part of the United States, and Richard Pakenham, on the part of Great Britain, and ratified on the 17th of July 1846, the boundary was fixed at 49° to the middle of the channel separating the continent from Vancouver Island and thence "southerly through the middle of the said channel and of Fuca's Straits to the Pacific Ocean." A dispute later arose over this water-line. The act establishing a territorial government for Oregon was approved on the 14th of August 1848, and the first governor, Joseph Lane (1801-1851), assumed the 6th government on the 3rd of March 1849. Following the increase of population north of the Columbia, the territory was divided, and Washington Territory was established on the 2nd of March 1853, with the river as the southern boundary to the point where it is intercepted by the forty-sixth parallel, and thence along that parallel to the summit of the Rocky Mountains, thereby including portions of the present states of Idaho and Montana. The first governor, Major Isaac I. Stevens, of the United States Army, took charge on the 20th of September 1853, and a census indicated a population of 3065 of whom 1682 were voters. Olympia was chosen as the temporary seat of
government, and Governor Stevens at once set to work to extinguish the Indian titles to land and to survey a route for a railway, which was later to become the Northern Pacific. The Indians, alarmed by the rapid growth of the white population, attempted to destroy the scattered settlements and the wandering prospectors for gold, which had been discovered in eastern Washington in 1855. Between 1855 and 1859, after many sharp contests, the Indians were partially subdued.

Shortly after 1846, the British began to assert that the Rosario Strait and not Puget Strait (as the Americans held) was the channel separating the mainland and Vancouver Island, and thus claiming the Haro Archipelago of which San Juan was the principal island. Conflict of authority arose, and in 1859 San Juan was occupied by U.S. troops commanded by Captain George E. Pickett (1825-1879), and for a time hostilities seemed imminent. By agreement joint occupation followed until, by the Treaty of Washington (May 8, 1871), the question was left to the German emperor, who decided (October 21, 1872) in favour of the United States. Meanwhile Oregon was admitted as a state (February 14, 1859), with the present boundaries, and the remnant of the territory, including portions of what are now Idaho and Wyoming, was added to Washington. The discovery of gold in this region, however, brought such a rush of population that the Territory of Idaho was set off (March 3, 1860) and Washington was reduced to its present limits. Rapid growth in population and wealth led to agitation for statehood, and a constitution was adopted in 1878, but Congress declined to pass an enabling act. The development of Alaska and the completion of the Northern Pacific Railroad to the coast (1883) brought a great increase in population. A large number of Chinese coolies who had been introduced to construct the railway congregated in the towns on the completion of the work, and in 1885 serious anti-Chinese riots led to the declaration of martial law by the governor and to the use of United States troops. Finally the long-desired admission to statehood was granted by Congress (February 22, 1889) and President Benjamin Harrison (November 11, 1889) formally announced the admission complete.

Since admission the progress of the state has continued with increasing rapidity. The Alaska-Yukon Exposition, designed to exhibit the resources of western America, held at Seattle June-October 1909, was a complete success. In politics the state has been Republican in national elections, except in 1896, when it was carried by a fusion of Democrats and Populists. A Populist was elected governor and was re-elected in 1900.

**WASHINGTON,** a table or stand containing furnishings for personal ablations. In its 18th-century form it was called a "bath stand" or "bath frame," and is still sometimes described as a "wash-hand stand." Its direct, but remote, ancestor was the monastic lavabo, ranges of basins of stone, lead or marble in continuous lines. They were usually of primitive conception, and a trough common to all was probably more frequent than separate basins. Very occasionally they were of bronze adorned with enamels and blazoned with heraldry. Very similar usages obtained in castles and palaces, fixed lavatories being constructed in the thickness of the walls for the use of their more important residents. These arrangements were obviously intended only for the summary ablutions which, until a very late date, sufficed to even the high-born. By degrees the lavabo became portable, and a "bath frame" is mentioned as early as the middle of the 17th century, as early as date of others earlier than the third or fourth decade of the 18th century are, however, virtually unknown. Thenceforward, until about the end of that century, this piece of furniture was usually literally a "stand." It was supported upon a tripod; a circular orifice in the top received the basin, and smaller ones were provided for a soap dish and a water-bottle. Sometimes a stand for the water-jug when the basin was in use was provided below, and very commonly there was a drawer, sometimes even two drawers, below the basin. Great numbers of these stands were made to fit into corners, and a "corner wash stand" is still one of the commonest objects in an old furniture shop. Chipendale designed such stands in an elaborate rococo fashion, as well as in simpler form. As the 18th century drew to its close the custom of using the same apartment as reception room by day and sleeping room by night produced a demand for what was called "harlequin furniture"—pieces which were contrived a double or triple debt to pay. Thus a variety of complicated combination washstands and dressing tables were made, and fitted with mirrors and sometimes with writing conveniences and drawers for clothes. Sheraton developed astonishing ingenuity in devising a type of furniture which, if we may judge by the large number of examples still existing, must have become highly popular. With the beginning of the 19th century and the expansion of ideas of personal cleanliness, the washstand grew in size and importance. It acquired the form of an oblong wooden table provided, like its smaller predecessors, with orifices for basins and fitted with a broad shelf-like stretcher upon which the jugs were placed when they were removed from the basins. Ample space was provided for soap-dishes and water-bottles. These tables were single or double, for the use of one or two persons. The washstand, as we know it in the 20th century, took its final form when the wooden top was replaced by marble, unpierced, the basins being placed upon the slab, which, in the beginning almost invariably white, is now often of red or other warm-tinted marble.

**WASP (Lat. vespa),** the common name for a well-known sort of stinging insect. The order Hymenoptera is divided into two sub-orders, the Symphyta and the Apocrita. The latter is subdivided into several sections, one of which, the Vespidae, includes all the true wasps; in addition to the ruby wasps and many of the "Fossores" or digging wasps.

The true wasps (forming the old section Diploptera) are in turn divided into three families—(1) the Vespidae, (2) the
Eumenidae, and the Masaridae, which together comprise some 1300 different species. They are characterized by their wings, which are pinnate, both sexes and also in the most females or antennae, being longitudinally folded when at rest, except in the Masaridae. The antennae are usually elobated, and contain twelve or thirteen joints; in some cases they are clavate. A pair of notched facetted eyes are present, and three ocelli in the top of the head. The mouth-parts are arranged for sucking, but have not reached that degree of perfection found amongst the bees. Hence wasps cannot obtain the sugary secretion from deep-seated nectaries, and their visits to flowers are confined to such as are shallow or widely opened; they particularly frequent the tubular flowers, and the campion and biotoon. Besides a slender, elongated, maxillary palp six-jointed. The labium is prolonged centrally into a "tongue," which is glandular at the tip; the paraglossae are linear. The labial palp has three or four joints. The pro-thorax is oval, and its sides are prolonged backward to the base of the wings. The fore wing has two or three submarginal cells. The legs are not provided with any adaptations for collecting pollen. The abdomen is sometimes pedunculated, its second (apparently first) segment being drawn out into a long stalk, which connects it with the alitrunk, made up of the thorax and the first abdominal segment. The quadrate of the last joint of the second abdominal segment is long and slender. The usual colour of these insects is black, relieved to a greater or less degree by spots and patches of yellow or buff.

The Diploptera may be subdivided into two groups in accordance with the habits of life of the insects comprising the section. One of the groups includes the family Vespidae, which is composed of social wasps, and includes the hornet (Vespa crabro) and the common wasp (V. vulgaris). The other group contains two smaller families, the Eumenidae and the Masaridae, the members of which resemble each other far more than the wasps.

Fig. 1.—Vespa crabro. In addition to their social habits the members of this family are characterized by certain structural features. The anterior wings have three submarginal cells. The labium is prolonged centrally into a "tongue," which is glandular at the tip; the paraglossae are linear. The labial palp has three or four joints. The pro-thorax is oval, and its sides are prolonged backward to the base of the wings. The fore wing has two or three submarginal cells. The other group contains two smaller families, the Eumenidae and the Masaridae, the members of which resemble each other far more than the wasps.

The Wasp.

It opens like a box lid, or gnaws a round hole through it. As soon as the cell is vacated it is cleaned out and another egg deposited. In this way two or three larvae occupy successively the same cell during the summer. The first wasps that appear in a nest are workers, and throughout the hot season workers are in the majority of the females or antennae, being longitudinally folded when at rest, except in the Masaridae. The antennae are usually elobated, and contain twelve or thirteen joints; in some cases they are clavate. A pair of notched facetted eyes are present, and three ocelli in the top of the head. The mouth-parts are arranged for sucking, but have not reached that degree of perfection found amongst the bees. Hence wasps cannot obtain the sugary secretion from deep-seated nectaries, and their visits to flowers are confined to such as are shallow or widely opened; they particularly frequent the tubular flowers, and the campion and biotoon. Fig. 1.—Vespa crabro.
The genus *Vespa* is very widely spread; it contains over forty species, distributed all over the world. Some of the largest and handsomest come from eastern Asia. *V. mandarina* of China and Japan, and *V. magnifica* of the East Indies and Nepal, measure 2 in. across the wings; *V. orientalis*, found in Greece, Egypt and the East, builds its nest of clay.

The only other genus of *Vespidae* which is found in Europe is *Polistes*, which occurs in the countries bordering the Mediterranean. The colonies of this genus are much smaller than those of *Vespa*. Each nest consists of a single tier of cells in the form of a round plate, supported in the middle by a single stalk. This comb is sometimes vertical, the cells then being horizontal or slightly oblique. Some of the members of this genus store up honey, which in the case of a South American species is poisonous, from the nature of the flowers from which it is made. Some others build their nests of mud. Like some of the species of *Eumenes*, they are up paralysed Lepidopterous and Chrysomelid larvae as food for their carnivorous grubs.

Family 3. **Masaridae.**—The members of the third family, the *Masaridae*, are sharply distinguished by the possession of only two submarginal cells in the fore wing, which folds imperfectly or not at all when at rest. Their antennae are frequently clavate, particularly in the larger species, in which they are twice-jointed, but as the terminal joints are almost fused they appear to be composed of only eight joints. The wings are not so completely folded as in the other two families, and the abdomen is but slightly contractile. The maxillae are short and the palp very small, but with three or four joints.

The number of genera comprised in this family is small; none occur in Britain, but in southern Europe some species are found. They make their nest in cavities in the earth, generally in a bank, and construct an irregular gallery leading down to it.

During hot fine summers wasps cause a good deal of loss to market gardeners and fruit growers. During this time of year they live almost exclusively upon the sweet juices of ripe fruit, occasionally carrying off small particles of the flesh. At the same time they have not entirely lost their carnivorous tastes, for they frequently attack the meat in butcher's shops, but render compensation by killing and carrying off to feed their grubs, countless numbers of scarabaeid grubs. Wasps also perform an important service in keeping down the numbers of caterpillars. The larvae are almost exclusively carnivorous, living upon insects captured by their parents and reduced by them to a pulp before being given to the young. During the spring the first broods that appear live largely upon honey; and this forms the staple food of the genus *Polistes* throughout their whole life.

In attempting to rid a district of wasps, unless the nest can be taken, there is little good in killing stray members of the community. On the other hand, the killing of queen-wasps in early spring probably means that the formation of a nest and the invention of a society whose members are counted by thousands is in each case prevented.

The number of wasps is kept down by numerous enemies. The most effective of these live in the nests and devour the larvae; among them are two species of beetle, *Rhizophorus paradoxus* and *Lebia lineatus*. Two species of *Ichneumon*, and a species of *Anthomyia*, also infest the nests of wasps and prey upon the grubs. The larvae of the syphid flies *Volucella*, found in the nests of both wasps and bees, are now believed to be scavengers rather than parasites. In the tropics some species are attacked by fungi, the hyphae of which protrude between

---

**Fig. 2.** Nest of *Vespa sylvestris*.

**Fig. 5.** *Masaridae vestiformis.*

Mexico and South America, is also pendent, but the combs are horizontal; the opening from the exterior is at the side, and the passage from one gallery to another is also lateral.

The external appearance of the nest of *Nectarina*, found in Brazil and other parts of South America, resembles that of the common wasp, but is rougher. Internally the combs are arranged concentri
cally, more or less parallel with the external covering which affords them support.

The members of the two remaining families, the Eumenidae and the *Masaridae*, resemble one another in their solitary mode of life; only males and normal females exist—no workers being found.

Family 2. **Eumenidae.**—Solitary species, with three submarginal cells in the fore wings; antennae with thirteen joints in the male, twelve in the female; abdomen sometimes pellucund, posterior segments contractile. In the foregoing structural features the Eumenidae resemble the *Vespidae*, but they differ in having bulbous...
the segments of the abdomen, and give the wasp a very extraordinary appearance.

WASSAIL (O. Eng. was hdt, "be whole," be well), primarily the ancient form of "toasting," the term being applied later to the Christmas feasting and revelries and particularly to the bowl of spiced ale or wine which was a feature of the medieval Christmas. One of the earliest references to the wassail-bowl in English history is in the description of the reception of King Vortigern by Hengist, when Rowena "carried into the king's presence, with a cup of gold filled with wine in her hand, and making a low reverence unto the king said, 'Waes hael hlaflord Cynyng," which is 'Be of health, Lord King." In a collection of ordinances for the regulations of the royal household in Henry VII. s reign, the steward on Twelfth Night was to cry "wassail" three times on entering with the bowl, the royal chaplain responding with a song. Wassailing was as much a custom in the monasteries as in laymen's houses, the bowl being known as poculum Carillat. What was popularly known as wassailing was the drinking of the initials of the name of a bowl which was carried round the streets by young girls singing carols at Christmas and the New Year. This ancient custom still survives here and there, especially in Yorkshire, where the bowl is known as the "vessel cup," and is made of holly and evergreens, inside which are placed one or two dolls trimmed with ribbons. This cup is borne on a stick by children who go from house to house singing Christmas carols. In Devonshire and elsewhere it was the custom to wassail the orchards on Christmas and New Year's eve. Pitchers of ale or cider would be carried over the roots of the trees to the accompaniment of a rhyming toast to their health.

WASTE (O. Fr. wast, gusst, gast, gaste; Lat. vastus, vast, desolate), a term used in English law in several senses, of which four are the most important. (1) "Waste of a manor" is that part of a manor subject to rights of common, as distinguished from the lord's demesne (see Commons, MANOR). (2) "Year, day, and waste" was a part of the royal prerogative, acknowledged by a statute of Edward II., De Praerogativa Regis. The king had the profits of freehold lands of those attainted of felony and petty treason, for a year and a day, with a right of committing waste in sense (3) thereon. After the expiration of a year and a day the lands returned to the lord of the fee. This species of waste was abolished by the Corruption of Blood Act 1814 (see Felony, TREASON). (3) The most usual significations of the word is "any unauthorized act of a tenant, for a freehold estate not of inheritance, or for any lesser interest, which substantially alters the permanent character of the thing demised (I.) by diminishing its value, (ii.) by increasing the burden on it, (iii.) by impairing the evidence of title and thereby injuring the "inheritance." (West Ham Charity Board v. East London W.W., 1900, 1 Ch. 624, 637; cf. Pollock, Law of Trusts, 7th ed., 345). (4) Waste in sense (3) either voluntary or permissive. Voluntary waste is by act of commission, as by pulling down a house, wrongly removing fixtures (q.e.), cutting down timber trees, i.e. oak, ash, elm, twenty years old, and such other trees, g. beech, as by special custom are counted timber, in the district, opening new quarries, mines (but not continuing the working of existing ones), or doing anything which— for this is the modern test—alter the nature of the thing demised, such as conversion into meadow land. Although an act may technically be waste, it will not as a rule constitute actionable waste, or be restrained by injunction, in the absence of some prohibitive stipulation if it is "ameliorating," i.e. if it improves the value of the land. See Meurig, G. Cobley, 1892, 2 Ch. 253, 263). In the case of "timber estates" upon which trees of various kinds are cultivated solely for their produce and the profit derived from this wild growth, the cutting of the timber is not considered as part of the inheritance but as the compensation of the estate, and an exception arises in favour of the tenant for life (see Dashwood v. Magniac. 1891, 3 Ch. 306). Under the Settled Land Act 1882 a tenant for life may grant building, mining and other leases for the prescribed terms "for any purpose whatever, whether involving waste or not." Permissive waste is by act of omission, allowing building, mining or repairs to be done which are not prohibited by the terms of the lease, which here includes "all who held by lease for life or lives, or for years by deed or without deed" by the statute of Marlborough (1267)—may not commit waste without licence in writing from the vewser. In the same manner for life or for any smaller interest holds (as is often the case by the terms of a will or settlement) "without impeachment of waste" (saeu impeachement de wast, i.e. without liability to have his goods challenged on account of waste) or, as stated in the 1882 Act, "what is called equitable waste, that is, pull down or deface the mansion or destroy timber planted or left for ornament or shelter (Veld-Blundell v. Wolesley, 1903, 2 Ch. 664). Acts of equitable waste were prohibited by the Agricultural Holdings Act 1900, but the Judicature Act 1873, s. 25 (1), in the absence of special provisions to that effect an estate for life without impeachment of waste does not confer upon the tenant for life any legal right to commit substantial waste. A copy-holder may not commit waste unless allowed to do so by the custom of the manor. The penalty for waste is forfeiture of the copyhold; Galbreath v. Eyton, 1905, 2 K.B. 258 (see Copy- holder). The Agricultural Holdings Acts 1900 and 1908, by virtue of their provisions giving compensation for improvement, as regards the holdings to which they apply, override some of the old common law doctrines as to waste. The act of 1900 provides (s. 2) that when the tenant, who can claim improvement, has wrongfully been guilty of waste, either voluntary or permissive, the landlord shall be entitled to set off the sums due to him in respect of such waste, and to have damages assessed against him by the courts provided by the acts of 1900 and 1906. Under the act of 1900 the tenant is permitted to disregard the terms of his tenancy as to the mode of cropping on arable land, but if he exercises his statutory freedom of cropping in such a manner as to cause injury, the landlord is entitled to recover damages for such injury, &c. (s. 3).

Waste; Remedies for.—Various remedies for waste have been given to the overseer at different periods in the history of English law. At common law only single damages seem to have been recoverable. This was altered by the legislature, and for some centuries waste was a "single" or quasi-civil action. More recently, a guardian committing waste of the lands in his custody should make amends and lose his office. The statute of Marlborough (1267) made a " fermor " (as above defined) committing waste liable to great damages as well as to damages, and followed Magno Carta in forbidding waste by a guardian. The statute of Gloucester (1278) enacted that a writ of waste might be granted against a tenant for life or for years or in courtesy or dower, and on being attainted of felony the tenant was to forfeit the land wasted and to pay three times the amount of the waste. This statute was repealed by the Civil Procedure Acts Repeal Act 1879. In addition to the writ of waste the term estrepement or estrepement of a copyhold, (and to be connected with the French estropier, to lame), lays to prevent injury to an estate to which the title was disposed. This writ has long been obsolete. Numerous other statutes dealt with remedies for waste. The writ of galee in the medieval time was the " mixed action " of waste (itself abolished by the Real Property Limitation Act 1833), and by the action of trespass on the case (see TRESPASS). The court of chancery also intervened by injunction to restrain equitable waste. At present proceedings may be taken either by action for damages, or by application for an injunction, or by both combined, and either in the king's bench or in the chancery divisions. By the Judicature Act 1873, s. 25 (8), the old jurisdiction to grant injunctions to prevent threatened waste is considerably enlarged. The Rules of the Supreme Court, Ord. xvi. r. 37, enable a representative action to be brought for the protection of waste. In an action for waste, damages are given only to the person of whose own pockets as far as they have or might have had assets of the deceased (see EXECUTORS AND ADMINISTRATORS). Executors and administrators may consider the county court for waste of assets (County Courts Act 1888, s. 95).

Scotland.—In Scots law waste " is not used as a technical term, but the respective rights of far and life-tenant are much the same as in English. As a general rule, a life-tenant has no right to cut timber, even though planted by himself. An exception is admitted in the case of coppice wood, which is cut at regular intervals and allowed to grow again from the roots.

Grown timber is also available.
to the life-renter for the purpose of keeping up the estate or repairing buildings. Before making use of mature timber for estate purposes, the life-renter should give notice thereto in writing. He is also entitled to the use of the unimproved woods. Exceptional windfalls and storms are treated as grown timber. Life-renters by "constitutions" (i.e., by grant from the proprietor) as opposed to life-renters by "reservation" (where the estate is left to itself in conveying the fee to another) have, as a rule, no right to coals or minerals underground if they are not expressed in the grant or appear to have been intended by a testator to pass by his settlement, for instance. Where coals or minerals are expressly mentioned in the grant, and also in cases of life-rent by "reservation," the life-renter may work any mine which had been opened before the beginning of his right, provided he does not employ a greater number of men or a greater quantity of minerals than the unburdened proprietor did. All life-renters are entitled to such minerals as are required for domestic use and estate purposes.

The Passafore-French law (in force in Mauritius) and has been followed in substance in the civil codes of Quebec (art. 455) and St. Lucia (art. 406). In most of the other colonies the rules of English law are followed, and in many of them there has been legislation on the lines of the English Settled Land Acts. In India the law as to waste is included to some extent in the Transfer of Property Act (No. IV. of 1882) and its amendments. Section 168 deals with the liabilities of lessees for waste, which may be varied by the terms of the lease or by local usage. The liabilities for waste of persons having under Hindu or Mahomedan law limited interests in realty depend in the main upon those laws and not on Indian state laws.

United States.—"In the United States, especially in the Western states, many acts have been passed by the legislature for the purpose of using and improving the land—clearing wild woods, for example, in Indiana, or even in the Eastern states in a more general way" (Pollack, Torts, 7th ed., 345). Thus Virginia, North Carolina, Vermont and Tennessee have devised in favour of the tenant and lessee, while Massachusetts has adopted to them (Ruling Cases, tit. "Waste," xxv. 380, American notes). In certain states, e.g., Minnesota, Oregon and Washington (ibid., p. 381), the action of waste is regulated by statute.

England.—The French Civil Code provides (art. 591) that the usurious may cut timber in plantations that are laid out for cutting, and are cut at regular intervals, although he is bound to lower expenses than the former proprietors as to the price of timber. This provision is found in Belgium and Germany (art. 593). Analogous provisions are to be found in the civil codes of Holland (art. 814), Spain (art. 485), Italy (art. 486), and in the German Civil Code, art. 158a.

WATCH

(Watch) (In O. Eng. wacce, a keeping guard or watching, from wacian, to guard, watch, wacen, to wake), a portable time-piece. This is the most common meaning of the word in its substantial form, and is the subject of the present article. The word, by derivation, means that which keeps watchful or wakeful observation or attention over anything, and hence is used of a person or number of persons whose duty it is to protect anything by vigilance, a guard or a sentry; it is thus the term for the body of persons who patrolled the streets, called the hours, and performed the duties of the modern police. The application of the term to a period of time is due to the military division of the night into hours ("hours" and "vigilae") marked by the change of sentinels; similarly, on shipboard, time is also reckoned by "watches," and the crew is divided into two portions, the starboard and port watches, taking duty alternately. The transference of the word to that which marks the changing hours is easy.

In the British navy the twelve hours of the night are divided into three watches of four hours—eight from twelve to two, the first watch, from twelve to four the middle watch, and from four to eight the last watch. The twelve hours of the day are divided into four watches, two of four hours—eight to midday, midday to four P.M., and two of two hours, from four to six and six to eight. These are the "dog watches," and their purpose is to change the turn of the watch. The first-four watches of the day and night, from eight to midnight on one hand, shall watch from midnight till 4 A.M. on the next. The "watch bill" is the list of the men appointed to the watch, who are mustered by the officers. The time was originally kept by an hour-glass, every half-hour; the number of the half-hour...

The invention of portable timepieces dates from the end of the 15th century, and the earliest manufacture of them was in Germany. They were originally small clocks with mainsprings enclosed in boxes; sometimes they were of a globular form and were often called "Nuremberg eggs." Being too large for the pocket they were frequently hung from the girdle. The difficulty with these early watches was the inequality of action of the mainspring. An attempt to remedy this was provided by a central device called the stack-freed, which was little more than a sort of rude auxiliary spring. The problem was solved about the years 1535-1540 by the invention of the fusee. By this contrivance the mainspring is made to turn a barrel on which is wound a piece of catgut, which in the latter part of the 16th century was replaced by a chain. The other end of the catgut band is wound upon a spiral drum, so contrived that as the spring runs down and becomes weaker the leverage on the axis of the spiral increases, and thus gives a stronger impulse to the works (fig. 1).

In early watches the escapement was the same as in early clocks, namely, a crown wheel and pallets with a balance ending in small weights. Such an escapement was, of course, very imperfect, for since the angular force acting on the balance does not vary with the displacement, the time of oscillation varies with the arc, and this again varies with every variation of the driving force. An immense improvement was therefore effected when the hair-spring was added to the balance, which was replaced by a wheel. This was done about the end of the 17th century. During the 18th century a series of escapements were invented to replace the old crown wheel, ending in the chronometer escapement, and though great improvements in detail have since been made, yet the watch, even as it is to-day, may be called an 18th-century invention.

The watches of the 16th century were usually enclosed in cases ornamented with the beautiful art of that period. Sometimes the case was fashioned like a skull, and the watches were made in the form of octagonal jewels, crosses, purses, little books, dogs, sea-shells, &c., in almost every instance being finely engraved. Queen Elizabeth was very fond of receiving presents, and, as she was also fond of clocks, a number of the gifts presented to her took the form of jewelled watches.

The man to whom watch-making owes perhaps most was Thomas Tompion (1639-1713), who invented the first dead-beat escapement for watches (fig. 2). It consisted of a balance-wheel mounted on an axis of semi-cylindrical form with a notch in it, and a projecting stud. When the teeth of the scape-wheel came against the cylindrical part of the axis they were held from going forward, but when the back of the axis was reversed, the teeth slipped past the notch and struck the projection, thus giving an impulse. This escapement was afterwards developed by George Graham (1673-1751) into the horizontal cylindrical escapement and into the well-known dead-beat escapement for clocks.

The development of escapements in the 18th century greatly is shown by striking the watch bell, hanging on a beam of the forecastle, or by the mainmast, with the clapper. One stroke is given for each half-hour. Thus 12.30 A.M. is one bell in the middle watch. The bell was also used to indicate the course of a ship in a fog. A vessel on the starboard tack tolled the bell. A vessel on the port tack beat a drum. The watch guns were fired when setting the watch in the evening and relieving it in the morning. The gun is now only fired at sundown.
improved watches. But a defect still remained, namely, the influence of temperature upon the hair-spring of the balance-wheel. Many attempts were made to provide a remedy. John Harrison proposed a curb, so arranged that alterations of temperature caused unequal expansion in two pieces of metal, and thus actuated an arm which moved and mechanically altered the length of the hairspring, thus compensating the effect of its altered elasticity. But the best solution of the problem was ultimately provided by the French, Pierre le Roy (1717–1788) and perfected by Thomas Earnshaw (1749–1829). This was to diminish the inertia of the balance-wheel in proportion to the increase of temperature, by means of the unequal expansion of the metals composing the rim.

Invention in watches was greatly stimulated by the need of a good timepiece for finding longitudes at sea, and many successive rewards were offered by the government for watches which would keep accurate time and yet be able to bear the rocking motion of a ship. The difficulty ended by the invention of the chronometer, which was so perfected towards the early part of the 18th century as to have even now undergone but little change of form. In fact the only great triumph of later years has been the invention of watch-making machinery, whereby the price is so lowered that an excellent watch (in a brass case) can now be purchased for about £2 and a really accurate time-keeper for about £18.

A modern watch consists of a case and framework containing the four essential parts of every timepiece, namely, a mainspring and apparatus for winding it up, a train of wheels with hands and a face, an escapement and a balance-wheel and hairspring. We shall consider each in turn.

The Mainspring.—As has been said, the mainspring of an old-fashioned watch was provided with a drum and fusee so as to equalise its action on the train. An arrangement was provided to prevent overwinding, by an ingenious locking of a book when the chain was nearly wound up was pushed aside so as to engage a pin, and thus prevent further winding (see fig. 1). Another arrangement for watches without a fusee, called a Geneva stop, consists of a wheel with one tooth after the other, and the balance-wheel is wound up in stages of four or five teeth. This allows the barrel arbour only to be turned round four or five times.

The going-barrel, which is fitted to modern watches, contains no fusee, but the spring is delicately made to diminish in size from one end to the other, and it is wound up for only a few turns, so that the force derived from it does not vary very substantially. The uneveness of drive is in modern watches sought to be counteracted by the construction of the escapement and balance-wheel.

Watches used formerly to be wound with a separate key. They are now wound by a key permanently fixed to the case. The dependence of a small knob gears the winding key with the hands so as to enable them to be set. With this contrivance watches are well protected against the entry of dust and damp.

With respect to escapements that have come into practical use are: (1) the old vertical escapement, now disused; (2) the lever, very much the most common in English watches; (3) the horizontal or cylinder, which is equally common in foreign watches, that is, the balance-wheel is fixed on a cylinder and driven by a very strong rack and pinion, which engages the teeth of the balance-wheel and makes it go round in an almost uniform motion. This escapement is also made with four or five teeth, and is the most common in carriage watches. The cylinder is fixed on the balance-wheel and the wheel is wound up by a key so that the cylinder will rotate round the balance-wheel in a vertical position; the particles of metal constituting the balance-wheel are universally fixed in the same way, but are raised on short stems above the plane of the wheel; and still more of the cylinder than the portion of the cylinder which belongs to the escapement, it is quite common; it is in practice even more common. The cylinder itself has to pass through the level of the wheel, which is very delicate; and probably this is the main reason why, although it is an English invention, it has been most entirely abandoned by the English watch-makers in favour of the lever, which was originally a French invention; though very much improved by Mudge, for before his invention the lever had a rack or portion of a toothed wheel on its end, working into a pinion on the balance-plate, and consequently it was affected by the dead friction, and that of this wheel and pinion besides. This used to be called the rack lever, and Mudge's the detached lever; but, the rack lever being in use in the part of the escapement called the cylinder, which has become confounded with the escapement of the cylinder, to which it is more appropriate, as will be seen presently. The Swiss watches have almost universally the horizontal escapement. It is found, and has been found, to be a great advantage, and is apparently unknown, as the rule certainly does not hold in cases seemingly analogous—a steel plane-escapement acts better in this escapement than a brass one, although in other cases steel is better. This escapement is the one to which the balance-wheel is wound up by a key and which engages the teeth of the balance-wheel and makes it go round in an almost uniform motion. When the balance is turning in the direction marked by the arrow, and it comes to the position in which the pallet of the lever P has its point against the triangular notch V, the tooth end slips into the notch, and, as the verge turns farther, the tooth engages in the next notch and goes on with it till at last it escapes when the tooth has got into the position A; and by that time the long tooth of the pallet which projects from the balance-wheel has been moved from p to P, and just come in front of the pin P, which stands on the rim of the s')ape-wheel, and which now begins to push against P, and so gives the impulse until it also escapes when it has arrived at the position A. The tooth B having got into the position b, with its point resting against the verge, and there is dead friction between them, and this friction is lessened by the

Fig. 4.

Fig. 5.

The lever escapement, as it is now universally made, was brought into use late in the 18th century by Thomas Mudge. Fig. 4 shows its action. The pallets, which lie in the plane of the paper, are immaterial in principle, and is only a question of convenience in the arrangement; but it is generally such as we have given. The manner in which the pallets are operated is interesting, with the advantage that there is no friction on the dead faces of the pallets beyond what is necessary for locking. The reason why this friction cannot be avoided with a pendulum is that its arc of vibration is so small. If you imagine that a pendulum attached to the ends of the two circles described by the end S of the lever and any pin in the pendulum which would work it; whereas, in a watch, the pin P, which is set in a cylinder on the verge of the balance, does not generally slip off the neck in the end of the lever until the balance has got 35° past its middle position. The pallets are under-cut a little, as it is called, i.e. the dead faces are so sloped as to give a little recoil the wrong way, or slightly to resist the unlocking, because otherwise there would be a risk that a shake of the watch might let a tooth escape, because the pin S on the lever fits as they pass; but when the notch has got past the cylinder it would prevent the lever from returning, because the safety-pin S cannot pass through the notch, which is only in the position for letting it pass at the same time that the impulse-pin is engaged in the lever. In the lever escapement (except lead and cheap ones) are always jewelled, and the s'ape-wheel is of brass. The staff of the lever also has jewelled pivotings, for the insensible wear of the s'ape-wheel has in all good ones. The holes for the balance-pivots are now always jewelled.

The s'ape-wheel in this and most of the watch escapements generally beats five times in a second, in large chronometers four times; and the wheel next to the s'ape-wheel carries the seconds-hand.

Fig. 5 is a plan of the horizontal or cylinder escapement, cutting through the cylinder, which is on the verge of the balance, at the point that the top of the teeth of the s'ape-wheel, for the triangular pieces A, B are not flat projections in the same plane as the teeth, but are raised on short stems above the plane of the wheel; and still more of the cylinder than the portion of the cylinder which belongs to the escapement does, though much less in appearance, because in this escapement there is a free friction of the cylinder, first on the outside, as here represented, and then on the inside, as shewn by the dotted lines, during the whole vibration of the balance-wheel. The cylinder is fixed on the balance-plate, and consequently it was affected by the dead friction, and that of this wheel and pinion besides. This used to be called the rack lever, and Mudge's the detached lever; but, the rack lever being in use in the part of the escapement called the cylinder, which has become confounded with the escapement of the cylinder, to which it is more appropriate, as will be seen presently. The Swiss watches have almost universally the horizontal escapement. It is found, and has been found, to be a great advantage, and is apparently unknown, as the rule certainly does not hold in cases seemingly analogous—a steel s'ape-escapement acts better in this escapement than a brass one, although in other cases steel is better. This escapement is the one to which the balance-wheel is wound up by a key and which engages the teeth of the balance-wheel and makes it go round in an almost uniform motion. When the balance is turning in the direction marked by the arrow, and it comes to the position in which the pallet of the lever P has its point against the triangular notch V, the tooth end slips into the notch, and, as the verge turns farther, the tooth engages in the next notch and goes on with it till at last it escapes when the tooth has got into the position A; and by that time the long tooth of the pallet which projects from the balance-wheel has been moved from p to P, and just come in front of the pin P, which stands on the rim of the s'ape-wheel, and which now begins to push against P, and so gives the impulse until it also escapes when it has arrived at the position A. The tooth B having got into the position b, with its point resting against the verge, and there is dead friction between them, and this friction is lessened by the...
distance of the points of the long teeth from the centre of the escapement. As the balance turns back, the nick V goes past the end of the catenary V, and in so doing the escapement is visibly affecting the motion of the escape-wheel, though of course it does produce a very slight shake in passing. It is evident that, if it did not pass, the tooth could not get into the nick for the next escape. The objection to the escape-wheel is, however, the delicacy of adjustment, and the watch also requires to be worn carefully; for, if by accident the balance is once stopped from swinging back far enough to cause the molecules of the tooth to start it, it is impossible to bring them altogether, as it will lose still more of its vibration the next time from receiving no impulse. The performance of this escapement, when well made, and its independence of oil, are nearly equal to those of the detached escapement; but, when, on the other hand, it is sufficiently good for all but astronomical purposes, for which chronometers are used, and they are cheaper both to make and to mend than duplex ones, the manufacture of duplex watches has almost disappeared.

The chronometer or detached escapement shown at fig. 7, in the form in which it was brought by Earnshaw, and in which it has remained ever since, with the very slight difference that the pallet P, on which the impulse is given (corresponding exactly to the pallet P in the duplex escapement), is now generally set in a radial direction from the verge, whereas Earnshaw made it sloped backward, or undercut, like the sedge-wheel teeth. The early history of escapements on this principle does not seem to be very clear. They appear to have originated in France; but there is no doubt that they were conceived in an idea by the first user, Mr. Mudge, who invented in 1799 Earnshaw's watches, however, generally beat his in trials.

In fig. 7, the small tooth or cam V, on the verge of the balance, is just on the point of unlocking the detent DT from the tooth T of the sedge-wheel; and the tooth T of the sedge-wheel is just on the impulse on the pallet P, which, in good chronometers, is always a jewel set in the cylinder; the tooth V is also a jewel. This part of the action is so evident as to require no further notice. When the balance returns, the tooth V has to get past the end of the detent DT and come in closer to the tooth T for another impulse to be given. If it should have been unlocked, it falls against the banking-pin E, and is ready to receive the next tooth B, and must stay there until it is again unlocked by the tooth T. Now, a stiffish spring, which is screwed to the block D on the watch frame, so that it moves without any friction of any kind, like a pendulum. If the tooth T is not done by means of an arm VT, called the passing spring, which can be pushed away from the body of the detent towards the left, but cannot be pushed the other way without carrying the detent with it. In the back vibration, therefore, as in the duplex escapement, the balance receives no impulse, and it has to overcome the slight resistance of the passing spring besides; but it has no other friction, and is entirely detached from the escape-wheel for the same time, during the whole time it is not unlocked.

That is also the case in the lever escapement; but the impulse in that escapement is given obliquely, and consequently with a good deal of friction. The advantage of the sedge-wheel over all other escapements, the timing of the action of the different parts requires great care, i.e. the adjusting them so that each may be ready to act exactly at the right time; and it is curious that the arrangement which would be geometrically correct, or suitable for a very slow motion of the balance, will not do for the real motion. If the pallet P were really set so as just to point to the tooth A in both escapements at the moment of unlocking (as it has been drawn, because otherwise it would look as if it could not act at all), it would run away some distance before the tooth could catch it, because in the duplex escapement the escape-wheel is then only moving slowly, and in the sedge-wheel at all. This is, of course, the start of the pallet P is therefore, in fact, set a little farther back, so that it may arrive at the tooth A just at the time when A is ready for it, without wasting time and force required to unlock the detent. The detached escapement has also been made on the duplex plan of having long teeth for the locking and short ones or pins nearer the centre for the impulse; but the advantages do not appear to be worth the additional trouble and risk of care required for the detent unlocked, diminished by the arrangement, as the spring D must in any case be fairly still, to provide against the watch being carried in the position in which the weight of the detent helps to unlock it.

If the tooth T is set so as to catch the teeth several times in succession, which implies that it has never come into general use. It is a combination of the lever as to the locking and the chronometer as to the impulse, and involves the disadvantage of the escape-wheel, because the nearer they are to the crossbar the less distance they will move over as the rim bends with them. The timing is done in two steps, one at the ends of the crossbar, and one by the ends of the crossbar, and consequently not affected by the bending of the rim; other screws are also provided round the rim for adjusting the moment of inertia and centre of gravity of the balance-wheel. The compensation may be done approximately by
the known results of previous experience with similar balances; and many watches are sold with compensation balances which have never been tried or adjusted, and then these balances with a mere sham compensation balance, not even cut through.

Secondary Compensation. — When chronometers had been brought to great perfection it was perceived that there was a residuary error, which was due to changes of temperature, and the maker of the compensation would correct. The cause of the secondary error is that as the temperature rises the elasticity of the spring increases, and the moment of inertia of the balance-wheel diminishes. Hence the watch tends to slow.

In order to compensate this the split rim of the balance-wheel is made with the more expansible metal on the outside, and therefore tends to curl inward with increase of temperature, thus diminishing the moment of inertia of the wheel. Now the rate of error caused by the increase of temperature of the spring varies approximately with the temperature according to a certain law, but the rate of correction due to the diminution of the moment of inertia of the rim changes very much less, and the form of the rim of the wheel does not alter proportionally, but according to a more complex law of its own, varying more rapidly with cold than with heat, so that if the rate of the chronometer is correct, say, at to°F, and also at 50°F, it will gain at all intermediate temperatures, the spring being thus under-corrected for high temperatures and over-corrected for low. Attempts have been made by alterations of shape of the balance-wheel to harmonize the progress of the error with the progress of the correction, but not with very conspicuous success.

We shall give a short description of the principal classes of inventions for this purpose. The first disclosed was that of J. S. Effe (sometimes attributed to Robert Molyneux), which was communicated to the astronomer-royal in 1835. In one of several methods proposed by him a compensation is introduced in the spring. J. S. Effe, though, for the reasons given before, this will not answer for the primary compensation, it may for the secondary, where the motion required is very much smaller. In another the primary compensation bar is fixed to the case, and this device is of little weight attached at some mean temperature, and, as it bent farther in, it carried this secondary compensation weight along with it. The obvious objection to this is that it is discontinuous; but the whole motion is so small, not more than the thickness of a piece of paper, that this and other compensations on the same principle appear to have been on some occasions quite successful.

A similar device is the the brass and steel cylinder, which may be represented by E. J. Dent’s, which came next in order of time. He described several forms of his invention; the following description applies to the one he thought the best. In fig. 9 the flat cross- bar \( p \) is itself a compensating device, and the small weight attached to it would act partly as a pendulum, so that the time would vary according as the watch was placed in different positions. It is exceedingly difficult to adjust a watch so that these positions, the three principal ones, and the others, can be so proportioned that they neutralize their effect by mounting the balance-wheel and hairspring upon a revolving carriage which shall slowly rotate, so that in succession every possible position of the balance-wheel and spring is tried, and the errors are averaged and mutually destroy one another. This is called the tourbillon escapement. There are several forms of it, and watches fitted with it often keep extremely well.

Stop watches or chronographs are of several kinds. In the usual and simplest form there is a centre seconds hand which normally remains at rest, but which, when the winding handle is pressed in, and the spring is wound up, revolves at the rate of one revolution per second, usually to fifths. A second pressure arrests its path, enabling the time to be taken since the start. A third pressure almost instantaneously brings the seconds hand back to zero, this result being effected by a spring which, when the hand presses on it instantaneously, flies round to zero position. The number of complete revolutions of the seconds hand, i.e., minutes, is recorded on a separate dial.

Calendar work on watches is, of course, fatal to great accuracy of time-keeping, and is very complicated. A watch is made to record days of the week and month, and to take account of leap years. The method of proceeding is to alter the position of the escape wheel by a couple of teeth varying in the proper ratio to the variation of the intensity of the spring. The cylindrical spring stands above the crossbar and between the staples.

Fig. 10 represents E. T. Lorryeby’s mercurial compensation balance.

Besides the weights D, D, set near the end of the primary compensation bars B, B, there are small bent tubes F, F with mercury in them, like a thermometer, the bulbs being at P, P. As the heat increases, not only do the primary compensation bars become longer, but the F, F approach the centre of the balance, but some of the mercury is driven forward, and sometimes much more than is lost, and the tube takes its weight towards the centre, at a ratio increasing more rapidly than the temperature. The whole is enclosed in an iron case, which is fitted with a little air included. The action is here equally continuous throughout, and the hair spring has a primary and secondary compensation are apparently more independent of each other; and this is much more true of Lorryeby’s use of mercury for compensated balances (which does not appear to have answered) is certainly very elegant and ingenious. Nevertheless an analysis of the Greenwich lists shows that this hypothesis has not proved that the advantage of this method over the others was more theoretical than practical; Dent’s compensation was the most successful of all in three years out of the seven, and Lorryeby’s in only one.

Lorryeby’s method has never been adopted by any other chronicmerkaker, though the principles both of Effe’s and of Dent’s methods have been adopted by other makers.

A few chronometers have been made with glass balance-springs, which have the advantage of requiring very little primary and no secondary compensation, on the other hand, they are liable to Wilhelm, comparatively with springs of steel or any other metal.

One of the most important and interesting attempts to correct the temperature errors of a hair-spring by a series of corresponding corrections, has been made by means of the use of the nickel-steel compound called invar, which, on account of its very small coefficient of expansion, has been of great use for pendulum rods. In a memoir published in 1890 at Geneva, Dr. Charles Guillaume, the inventor of invar, shows that in order to get a true secondary compensation what is wanted is a material having the property of causing the curve of the rim of the wheel to change at a rate proportional to the temperature. This is found in those specimens of invar in which the second coefficient of expansion is negative, i.e., which are less dilatable at higher temperatures than at lower ones. It is satisfactory to add that such balance-springs have been tried successfully on chronometers, and notably in a deck watch by Paul Ditisheim of Neuchâtel, who has made a chronometer with a tourbillon escapement and an invar balance-wheel, which holds the highest record ever obtained by a watch of its class.

It is obvious that in order that a watch may keep good time the centre of gravity of the balance-wheel and hair-spring must be quite close; any change of position would act partly like a pendulum, so that the time would vary according as the watch was placed in different positions. It is exceedingly difficult to adjust a watch so that these positions, the three principal ones, and the others, can be so proportioned that they neutralize their effect by mounting the balance-wheel and hairspring upon a revolving carriage which shall slowly rotate, so that in succession every possible position of the balance-wheel and spring is tried, and the errors are averaged and mutually destroy one another. This is called the tourbillon escapement. There are several forms of it, and watches fitted with it often keep excellent time.

Stop watches or chronographs are of several kinds. In the usual and simplest form there is a centre seconds hand which normally remains at rest, but which, when the winding handle is pressed in, and the spring is wound up, revolves at the rate of one revolution per second, usually to fifths. A second pressure arrests its path, enabling the time to be taken since the start. A third pressure almost instantaneously brings the seconds hand back to zero, this result being effected by a spring which, when the hand presses on it instantaneously, flies round to zero position. The number of complete revolutions of the seconds hand, i.e., minutes, is recorded on a separate dial.
WATER

not an easy thing to secure this result, for as the machines are used the cutting is left to the winding and binding at the mill. Hence a gold is not allowed to make more than a given quantity of parts without being examined and readjusted, and from time to time the pieces being put out are tested with calipers. The parts then go back to the men who are skilled in binding and giving the right size, which is then given over to the watch-adjusters, who put the parts together and make the watch go. The work of adjustment for common watches is a simple matter. But expert adjusters have a special trick for their trade, and they are trained for it. The finest watches are thus largely machine-made, but hand-finished. The prejudice against machine-made watches has been very strong in England, but is dying away, largely because of the trouble and cost of the latter. A flourishing watch industry exists in Switzerland in the neighbourhood of Neuchâtel. A watch in a stamped steel case can now be made for about five shillings. There is no reason why in such a country as Birmingham as the English watch industry should not revive.

The use of jewelled bearings for watch pivots was introduced by Nicholas Fatio about the beginning of the 18th century. Diamonds and sapphires are usually employed and pinned either by diamond drills or by drills covered with diamond dust. Rubies are not a very favourite stone for jewels, but as they and sapphires can now be machine-made by being cut artificially for about two shillings a carat, the difficulty of obtaining material for watch jewelling has nearly disappeared.

Watches have also been fitted with machinery whereby electric contacts are made by them at intervals, so that if wires are led to any of the pinions from an electric current the latter will then start and thus mark dots at regular intervals on a moving strip of paper.

As in the case of clocks, the accuracy of going of a watch is estimated by observation of the variations of mean daily departures. For this purpose the Observatories at Greenwich, Department of the Post Office, and near Richmond, and also for admiral purposes at Greenwich. At Richmond watches are divided into two classes, A and B. For an A certificate the trials last for four weeks and the watch is required to keep time within ±5 seconds (on average) from 9 to 90 °F., going in every position with dial vertical, face up and face down. The average daily departure from the mean daily rate, that is the average error due to irregular departures from the average going rate, must not exceed 2 seconds a day except where due to position, when it may amount to 5 seconds. The errors should not increase more than ±3 seconds a day for each 1 °F. The trial for the B certificate is somewhat similar but less severe. One very remarkable thing about watches is that their average error from mean rate is expected not to exceed ±5 seconds per diem. The fees for these tests are various sums from two guineas downwards. In estimating the time-keeping qualities of a watch or clock, the error of rate is of no consequence. It is simply due to the time-keeper going too fast or too slow, and this can easily be corrected. What is wanted for a good watch is that the rate, whatever it is, shall be constant. The daily error is of no account provided it is a uniform daily error and not an irregular one. Hence the object of the trials is to determine not merely the daily rate but the variations of the daily rate, and on the smallness of these the value of a watch, and as a time-keeper (G. H. H.C.)

WATER

Strictly speaking, water is the oxide of hydrogen which is usually stated to have the formula H2O (see below), but in popular use the term is applied to a great variety of different substances, all of which agree, however, in being the water of the chemist modified differently in the several varieties by the nature or proportion of impurities. In all ordinary waters, such as are used for primary purposes, the impurities amount to very little by weight—as a rule to less than 1/80th of 1%. Of all natural stores of water the ocean is by far the most abundant, and from it all other water may be said to be derived. From the surface of the ocean a continuous stream of vapour is rising up into the atmosphere to be condensed in colder regions and precipitated as rain, snow or sleet, etc. Some 2/8ths of these precipitates of course return directly to the ocean; the rest, falling on land, collects into pools, lakes, rivers, &c., or else penetrates into the earth, perhaps to reappear as springs or wells. As all the saline components of the ocean are non-volatile, rain water, in its natural state, can be contaminated only with the ordinary atmospheric gases—oxygen, nitrogen and carbon dioxide. Rain water also contains perceptible traces of ammonia, combined as a rule, at least partly, with the nitric acid, which is produced wherever an electric discharge pervades the atmosphere.

Lake waters, as a class, are relatively pure, especially if the mountain slopes over which the rain collects into a lake are relatively free of soluble components. For example, the water of Loch Katrine (Scotland) is almost chemically pure, apart from small, perceptible, traces of richly carboniferous matter taken up from the peat of the surrounding hills, and which impart to it a faint brownish hue, while really pure water is blue when viewed in a leaden basin. Rivers water varies much in composition even in the same bed, as a river in the course of its journey towards the ocean passes from one kind of earth to others; while, compared with spring waters, relatively poor in dissolved salts, rivers are liable to be contaminated with more or less of suspended matter.

Spring waters, having been filtered through more or less considerable strata of earth, are, as a class, clear of suspended, but rich in dissolved, mineral and organic matter, and may also contain gases in solution. Of the latter, the carbonic acid in particular is one of the most important; it is present in large measure, in both carbonic acid, and sulphate and common salt are most widely diffused. Common salt, however, in its natural occurrence is very much localized; and so it comes that spring and well waters are contaminated chiefly with calcium carbonate and sulphate. Of these two salts, however, the former is held in solution only by the carbonic acid of the water, as calcium bicarbonate. But a carbonate-of-lime water, if exposed to the atmosphere, even at ordinary temperatures, loses its carbonic acid, and the calcium carbonate is precipitated. The saltsalicates (q.v.) are usually adsorbed by native rocks, or occasionally produced in this manner. Many waters are valuable medicinal agents owing to their contained gases and salts (see MINERAL WATERS).

In addition to its natural components, water is liable to be contaminated through accidental influxes of foreign matter. Thus, in certain seasons, all the Scottish Highland lochs are brown through the presence in them of dissolved peaty matter. Rivers flowing through, or wells sunk in, populous districts may be contaminated with excrementitious matter, discharges from industrial establishments. The presence of especially nutritious organic matter is a serious source of danger, inasmuch as such matter forms the natural food or soil for the development of micro-organisms, including those which are of the nature of the so-called infectious diseases. Happily nature has provided a remedy. The nitrogenous organic matter dissolved in (say) a river speedily suffers disintegration by the action of certain kinds of bacteria, with formation of ammonia and other (harmless) products; and the ammonia, again, is no sooner formed than, by the conjoint action of other bacteria and atmospheric oxygen, it passes first into (salts of) nitrous and then nitric acid. A water which contains combined nitrogen in the form of nitrates only is, as a rule, safe organically; if nitrates are present it becomes liable to suspicion; the presence of ammonia is a worse symptom; and if actual nitrogenous organic matter is found in water, in the form of ammoniac, the presence of water is possibly (not necessarily) a dangerous water to drink.

All waters, unless very impure, become safe by boiling, which process kills any bacteria or germs that may be present.

Ordinary saline components of waters, soluble magnesia and calcium salts are the only ones which are objectionable sanitorily if present in relatively large proportion. Calcium carbonate is harmless; but, on the other hand, the presence of this component adds to the value of a water as a drinking water is a mistake. The farinaceous part of food alone is sufficient to supply all the lime the body needs; besides, it is questionable whether lime introduced in any other form than that of phosphate is available for the formation of, for instance, bone tissue.

The fitness of a water for washing is determined by its degree of softness. A water which contains lime or magnesium salts decomposes soap with formation of insoluble lime or magnesium salts of the fatty acids of the soap used. So much of the soap is simply wasted; only the surplus can effect any detergent action. Several methods for determining whether a water is soft or not. One of these is the method is to determine the lime and magnesia gravimetrically or by alkalimetry; or by Clark's soap test, but this process frequently gives inaccurate results. In this method, which, however, is largely used by means of a water of a known degree of hardness prepared from a known weight of carbonate of lime by converting it into neutral chloride of calcium, dissolving this in water and diluting to a certain volume. The hardness is variously expressed in terms of parts of lime per gallon of 70,000 grains; in Germany the parts of lime per 100,000 parts of water, and in France the parts of calcium carbonate per 100,000.
WATER-BOATMAN—WATERBURY

On the English scale, a water of 15° and over is hard, between 5° and 15° moderately hard, and of less than 5° soft.

A water of any hardness which is actually owing to carbonate of lime (or magnesia) can easily be removed in two ways. (1) By boiling, the free carbonic acid goes off with the steam, and the carbonate of lime, being bereft of its solvent, comes down as a precipitate, which can be collected, or by filtration, or by decantation, to settle, and decanting off the clear superfluous liquor. (2) A method of Clark's is to mix the water with just enough of milk of lime to convert the free carbonic acid into carbonates, and then, as the solution of lime are precipitated, and can be removed as in the first case.

From any uncontaminated natural water pure water is easily procured.

The specific gravity of distilled water is 1.000, and it must be taken that the steam to be condensed is dry, and if its condensation be effected within a tube made of a suitable metal (platinum or silver are best, but copper or block tin work well enough for ordinary purposes), and the steam is pure, then no impurities excepting moisture, which latter, if necessary, must be removed by boiling the distilled water in a narrow-necked flask until it begins to "bump," and then allowing it to cool in the absence of air. This latter operation ought, strictly speaking, to be performed in a silver or platinum flask, as glass is appreciably attacked by hot water. For most purposes distilled water, taken as it comes from the condenser, is sufficiently pure; the purest water is a matter of great difficulty. Stas, in his stoichiometric researches, mixed water with potassium manganate, and distilled after twenty-four hours; the product being redistilled and condensed in a platinum tube just before it was required.

Pure water, being so easily procured in any quantity, is used largely as a standard of reference in meteorology and in the quantitative determination of other substances. Thus "a gallon" is defined as the volume at 62° F. of a quantity of water whose uncorrected mass, as determined by weighing in air of 30-inch pressure and 62° F. of temperature, is equal to 10 lb avoirdupois. The kilogramme in like manner is the mass of 1 cubic decimetre of water, measured at the temperature corresponding to its maximum density (4° C.). The two fixed points of the thermometer correspond—the lower (0° C., or 32° F.) to the temperature at which ice melts, the upper (100° C., or 212° F.) to that at which the maximum tension of steam, as it rises from boiling water, is equal to 760 mm. or 30-inch mercury pressure, 30 in. being a little more than 760 mm., 212° F., is the temperature of water at 100° C., but the difference is very slight. Specific heats are customarily measured by that of water, which is taken as =1. All other specific heats of liquids or solids (with one exception, formed by a certain quantity of aqueous methyl alcohol) are less than 1. The temperature character of insular climates is greatly owing to this property of water. Another physiographically important peculiarity of water is that it expands on freezing (into ice), while most other liquids do the reverse. 11 volumes of ice fuse into only 10 volumes of water at 0° C.; and the ice-water produced, when brought up gradually to higher and higher temperatures, again exhibits the very exceptional property that it cannot be raised to 100° C. without its volume, and that of its water, expanding again by more and more per degree of increase of temperature, so that the volume at 100° C. is 1.043 times that at 4° C.

In former times water was viewed as an "element," and the notion of the ultimate elements has been important; but the time is past when it had assumed its present meaning, although cases of decomposition of water were familiar to chemists. In Boyle's time it was already well known that iron, tin, and zinc dissolve in aqueous hydrogen, or sulphuric acid with evolution of a stinking inflammable gas. Even Boyle, however, took this gas to be ordinary air contaminated with inflammable stinking oils. This view was held by all chemists until Cavendish, before 1784, showed that the gas referred to, if properly purified, is free of smell and constant in its properties, which are widely different from those of air, the most important point of difference being that the gas when kindled in air burns with a blue light, and that formation of water. Cavendish, however, did not satisfy himself with merely proving this fact qualitatively; he determined the quantitative relations, and found that it takes nearly 1000 volumes of air to burn 425 volumes of the gas. 

Cavendish, in turn, performed repeated experiments of Humboldt and Gay-Lussac, which were much more than Cavendish's to the prove that the surplus of 3 units (473 volumes instead of 400) of hydrogen was an observational error. This was confirmed by the researches of Moreton and Scott, who found that the ratio is not exactly 2.1. The gravimetric composition was determined by Berzelius and Dulong, and later by Dumas by passing gas through gold-plated tubes. It has also been determined by several other variations and methods (see HYDROGEN).

The molecular weight of liquid water has attracted much attention, for it was perceived long ago that its high boiling point, refractive index, and certain other properties were not in agreement with the formula H₂O. Cryoscopic measurements led to the probable formula H₂O₂, whilst the surface tension leads to H₂O₃. The question has been considered by H. E. Armstrong, who suggests that the simple molecule, H₂O, which he calls hydron, condenses in liquid water to form cyclic or chained compounds, containing tetravalent oxygen, resembling in structure the polymethylenes or paraflins.

WATER-BOATMAN, an aquatic hemipterous insect of the family Notonectidae, of which the best known species (Notonecta glauca) is a prominent feature in the pond-life of Great Britain. The technical name, Notonecta, meaning "back-swimmer," alludes to the habit of the insect swimming upside down, the body being propelled through the water by powerful strokes of the hind legs, which are fringed with hair and, when at rest, are extended laterally like a pair of sculls in a boat. As is the case with other water-bugs, this insect is predaceous and feeds upon aquatic grubs or worms. The body is richly supplied with long hairs, which serve to entangle bubbles of air for purposes of respiration. The eggs are laid in the stems of water plants.

WATERBUCK (Waterbok), the name of a large South African antelope (Cobus ellipsiprymnus) belonging to the subfamily Cervicaprinae, characterized by the white elliptical ring on the buttocks, and the general reddish grey colour of the long and coarse hair. They have heavily fringed necks and tufted tails; the bucks carry long sublunate and heavily fringed horns, but the hens are hornless. They seek refuge from pursuit in the water.

The name is extended to include the sing-sing or defassa waterbuck (C. defassa), a widespread species, with the white ring on the buttocks, and represented by several local races, one of which is foxy red while a second is greyish. Both species equal in size the red deer. The smaller members of the genus Cobus (which is exclusively African) are generally known as kobs. (See ANTELOPE.)

WATERBURY, a city and one of the county-seats of New Haven county, Connecticut, U.S.A., since 1900 coextensive with the township of Waterbury, on the Naugatuck river, in the west central part of the state, about 32 m. S.W. of Hartford. Pop. (1900) 51,130, of whom 15,368 were foreign-born (5866 being Irish, 2007 Italian, 1777 French Canadian, 1265 Russian, 1195 French, and 938 English); (1910 census) 73,141. Area 29 sq. m. Waterbury is served by the New York, New Haven & Hartford railway, and is connected by electric lines with New Haven, Bridgeport, Thomaston, Woodbury and Watertown. It has four public parks (the Green, Chase, Hamilton and Forest), with a total acreage of 86 acres, and a Soldiers' and Sailors' Monument, designed by George E. Bissell. The most important public buildings are the Federal building, the county court house, a state armory, the Silas Bronson Public Library (1870; with an endowment of $20,000 and with 1,500 volumes in 1910), the Odd Fellows Temple, a Y.M.C.A. building and the Buckingham Music Hall (1907); and among the charitable institutions are the Southmayd Home (1898) for aged women, the Waterbury hospital (1809) and the St Mary's hospital (1868). In the city are the St Margaret's Diocesan School for Girls (Protestant Episcopal, 1875), the Waterbury Industrial School and the Academy of Notre Dame (1868). There is good water power here from the Naugatuck river and its tributaries Mad river and Great Brook. In 1905 Waterbury ranked third among the manufacturing cities of Connecticut (being surpassed only by
WATER-DEER—WATERFORD

Bridgeport and New Haven, with a factory product valued at $32,367,359 (67.7% more than in 1900). The most important manufactured are rolled brass and copper (value in 1905, $12,599,726, or 24.3% of the total for the United States), brass-ware (value in 1905, $7,387,228, or 42.2% of the total for the United States), clocks and watches—over a million watches are made here each year—and stamped ware (value in 1905, $1,037,066). The manufacture of brass-ware originated here in 1822, with the making of brass buttons; iron buttons covered with silver were first made here about 1760, block tin and pewter buttons about 1800, bone and ivory buttons about 1812, sheet brass in 1830, and pins and plated metals for daggereotypes in 1842. Old-fashioned tall wooden clocks were made in Waterbury in the latter part of the 18th century, and cheap watches were first made here in 1879; these were long distinctive of Waterbury, and were often called "Waterbury watches." The manufacture of cloth dates from 1814, and broadcloth was first made here in 1835. The city has a large wholesale trade and is a shipping point for dairy products. The municipality owns and operates the waterworks.

The township of Waterbury was incorporated in 1686, having been since its settlement in 1677 a part of Farmington township known as Mattatuck. The city of Waterbury was first chartered in 1853. The city and the township were consolidated in 1901. City elections are held biennially and the mayor, city clerk, treasurer, comptroller, city sheriff and aldermen hold office for two years. With the consent of the Board of Aldermen the mayor appoints five clerks who constitute a department of public works; appoints three electors who with the mayor, comptroller, and president of the Board of Aldermen constitute a department of finance; appoints five electors who with the mayor constitute a department of public safety; and appoints five electors who constitute a department of public health. In 1902 there was a destructive fire in the business district of the city, and during a strike of street railway employees in 1903 state troops were called out to maintain order.

WATER-DEER, a small member of the deer-tribe from northern China differing from all other Cervidae except the musk-deer (with which it has no affinity) by the absence of antlers in both sexes. To compensate for this deficiency, the bucks are armed with long sabre-like upper tusks (see DEER). The species typifies a genus, and is known as Hydraraphus (or Hydraphes) inermis; but a second form has been described from Hankow under the name of H. kreyenbergi, although further evidence as to its claim to distinction is required. Water-deer frequent the neighbourhood of the large Chinese rivers where they crouch amid the reeds and grass in such a manner as to be invisible, even when not completely concealed by the covert. When feeding, they arch their backs and scurry away in a series of short leaps. In captivity as many as thirty have been produced at a birth.

This is one of the few deer in which there are glands neither on the head nor on the skin covering the cannon-bone. These glands probably enable deer to ascertain the whereabouts of their fellows by the scent they leave on the ground and herbage. The sub-aquatic habits of the present species probably render such a function impossible, hence the absence of the glands. The tail is represented by a mere stump. (R. L.)

WATERFALL, a point in the course of a stream or river where the water descends perpendicularly or nearly so. Even a very small stream of water falling from any considerable height is a striking object in scenery. Such falls, of small volume though often of immense depth, are common, for a small stream has not the power to erode a steady slope, and thus at any considerable irregularity of level in its course it forms a fall. In many mountainous districts a stream may descend into the valley of the larger river to which it is tributary by way of a fall, its own valley having been eroded more slowly and less deeply than the main valley. Mechanical considerations apart, the usual cause of the occurrence of a waterfall is a sudden change in geological structure. For example, if there be three horizontal strata, so laid down that a hard stratum occurs between two soft ones, a river will be able to grade its course through the upper or lower soft strata, but not at the same rate through the intermediate hard stratum, over a ledge of which it will consequently fall. The same will occur if the course of the river has been interrupted by a hard barrier, such as an intrusive dyke of basalt, or by glacial or other deposits. Where a river falls over an escarpment of hard rock overlying softer strata, it powerfully erodes the soft rocks at the base of the fall and may undermine the hard rock above so that this is broken away. In this way the river gradually cuts back the point of fall, and a gorge is left below the fall. The classic example of this process is provided by the most famous falls in the world—Niagara.

WATER-FLEA, a name given by the earlier microscopists (Swammerdam, 1669) to certain minute aquatic Crustaceans of the order Cladocera, but often applied also to other members of the division Entomostraca (q.v.). The Cladocera are abundant everywhere in fresh water. One of the commonest species, Daphnia pulex, found in ponds and ditches, is less than onetenth of an inch in length and has the body enclosed in a transparent bivalved shell. The head, projecting in front of the shell, bears a pair of branched feathery antennae which are the chief swimming organs and propel the animal, in a succession of rapid bounds, through the water. There is a single large black eye. In the living animal five pairs of leaf-like limbs acting as gills can be observed in constant motion between the valves of the shell, and the pulsating heart may be seen near the dorsal surface, a little way behind the head. The body ends in a kind of tail with a double curved claw which can be protruded from the shell. The female carries the eggs in a brood chamber between the back of the body and the shell until hatching takes place. Throughout the greater part of the year only females occur and the eggs develop "parthenogenetically" without fertilization. When the small males appear, generally in the summer, they fertilize the eggs or "resting eggs" are produced which are cast adrift in a case of "ephippium" formed by a specially modified part of the shell. These resting eggs enable the race to survive the cold of winter or the drying up of the water.

For a fuller account of the Cladocera and of other organisms which sometimes share with them the name of "water-flea," see the article ENTOMOSTRACA.

Mountains, reaching a height of 2504 ft. To the south of Dun- garvan there is a lower but very rugged range, called the Drum Hills. The south-eastern division of the county is for the most part level. Though Waterford benefits in its communications by the important rivers in its vicinity, the only large river it can properly claim as belonging to it is the Blackwater. This river is famous for salmon fishing, and, particularly in the stretch between Cappoquin and Lismore, flows between high, well- wooded banks, contrasting beautifully with the background of mountains. It enters the county east of Fermoy, and flows eastward to Cappoquin, the head of navigation, where it turns abruptly southward, to fall into the sea at Youghal Harbour. Waterford Harbour may be called the estuary of three important rivers, the Suir, the Nore and the Barrow, but neither of the two last touches the county. The Suir reaches it about 8 m. from Cennel, and thence forms its northern boundary with Tipperary and Kilkenny. It is navigable to Cennel, but the traffic lies mainly on the left bank, outside the county.

Geology.—The Knockmealdown Mountains are an anticline of Old Red Sandstone, cut away at the eastern end to expose Silurian strata, which are associated with an extensive series of volcanic and intrusive rocks, often crushed by earth-movement. The impressive Scarpsford Crag near Waterford and Sandhope, an elevation near the town, is called the Comeragh Mountains. The moraine-dammed cirque of Lough Cusshingaun lies in these, with a precipice 1000 ft. in height. The unconformity of the Old Red Sandstone on the Silurian strata is excellently seen on the north bank of the Suir at Waterford. Carboniferous Limestone is found in the floor of the synclines on either side of the great anticline, that is, in the Suir valley on the north, and in the green and richly-wooded valley of the River Blackwater on the south. Rapias and antiformal and synformal strata continue this structure across the country between Dunagarvan and Youghal. Rich copper-mines were worked, mainly in the 19th century, in the Silurian area near Benn- mahon, and the region remains full of mineral promises.

Industries.—The land is generally better adapted for pasturage than for tillage, although there are considerable tracts of rich soil in the county. Wheat and oats are the chief crops of tillage. The production of oats is, however, roughly as 1 to 3, though the acreage under the principal crops of oats, potatoes and turnips is on the whole fairly maintained. The numbers of cattle, sheep and poultry increase steadily, and pigs are extensively reared. The woollen manufacture, except for house use, is practically extinct, but the cotton manufacture is still of some importance. There are also breweries, distilleries and a large number of flour-mills. The valuable deep sea and coast fisheries have distinct headquarters at Waterford, and the exported salmon fisheries of the Suir and Blackwater have theirs at Waterford and Lismore respectively. Railway communication is provided by the Waterford-Dungarvan branch of the Great Southern and Western railway, traversing the county from E. to W.; and by the Waterford and Tramore railway, while the city of Waterford is approached by lines of the first-named company from the N. (from Thomastown) and the latter from Limerick.

Population and Administration.—The population (95,702 in 1831) fell to 92,060 in 1901 and decreases at a rate about equal to the average of the Irish counties, and emigration is considerable. Nearly 95% of the total are Roman Catholics, and about 7% constitute the native population. The chief towns are the city of Waterford (pop. 26,769), Dungarvan (4850), and Lismore (1583); Portlaw and Tramore, and Cappoquin are lesser towns. The county is divided into eight baronies. Down to the Union in 1800 the county returned two members, and the boroughs of Dungarvan, Lismore and Tallow each two. Thereafter, and before the Redistribution Act of 1885, the county returned two members, the boroughs of Waterford two, and Dungarvan one. The county now returns two members, for the east and west divisions respectively, while the county of the city of Waterford returns one member. Assizes are held at Waterford, and quarter sessions at Lismore, Dungarvan, and Waterford. The county is mainly in the Protestant diocese of Ossory, and the Roman Catholic diocese of Waterford and Lismore.

History and Antiquities.—In the 9th century the Danes landed in the district, and afterwards made a permanent settlement. Waterford was one of the twelve counties into which King John is said to have divided that part of Ireland which he nominally annexed to England. One of the first consequences of the convenience of the city as a landing place, many subsequent expeditions passed through the county, directed against disaffected or rebellious tribes. In 1444 the greater part of it was granted to James, earl of Desmond, and in 1447 it was bestowed on John Talbot, earl of Shrewsbury, who was created earl of Waterford. The county suffered severely during the Desmond rebellion, in the reign of Elizabeth, as well as in the rebellion of 1641 and during the Cromwellian period. There are in the county a considerable number of barrows, duns, cremlechs and similar relics of the ancient inhabitants. At Ardmore, overlooking the sea from Ram Head, there is a round tower 95 ft. in height, and near it a huge rath and a large number of circular encroachments. Among the old castles special mention may be made of Lismore, originally erected in 1185, but now in great part comparatively modern. The chief ecclesiastical remains are those of the chancel and nave of the cathedral of Ardmore, where a monastery and oratory were founded by St Declan in the 7th century. The see of Ardmore was abolished in the 12th century. Here are also remains of a church and oratory, and a holy well. Mention should be made of the existing monastery of Mount Melleray, a convent of Trappists founded near Cappoquin in 1836, on the expulsion of the Irish members of this order from France. Schools, both free and boarding, are maintained; and there is a branch of the order at Roscrea (Co. Tipperary).

WATERFORD, a city, county of a city, parliamentary borough, seaport, and the chief town of Co. Waterford, Ireland. Pop. (1901) 26,769. It is finely situated on the south bank of the Suir 4 m. above its junction with the Barrow, at the head of the tidal estuary called Waterford Harbour, 111 s. m. S. W. from Dublin by the Great Southern and Western railway. This is the principal railway serving the city, having lines from Dublin and Cork, and also serving the terminals of New Ross, Tramore, Rosslare, Waterford and Cork. Waterford is also, however, the terminus of the Dublin and South-Eastern line from Dublin via New Ross, and for the Waterford and Tramore line, serving the seaside resort of Tramore, 7 m. S. The Suir is crossed by a wooden bridge of thirty-nine arches, and 832 ft. long, connecting Waterford with the suburb of Ferrybank. The city is built chiefly along the banks of the river, occupying for the most part low and level ground except at its western extremity, and excepting the quay and the Mall, which connects with the southern end of the quay, its internal appearance is hardly of a place with the beauty of its environs. The modern Protestant cathedral of the Holy Trinity, generally called Christ Church, a plain structure with a lofty spire, occupies the site of the church built by the Danes in 1066, in the Mall. Near it are the episcopal palace and deanery. There is a handsome Roman Catholic cathedral, and the training seminary for priests called St John's College deserves notice. The principal secular buildings are the town-hall, the county and city courts and prisons, the custom-house and the barracks. At the extremity of the quay is a large circular tower, called Reginald's Tower, forming at one time a portion of the city walls, and occupying the site of the tower built by Reginald the Dane in 1093. Near the summit one of the balls shot from the cannon of Cromwell while besieging the city is still embedded in the wall. Other remains of the fortifications, consisting of towers and bastions, are to be seen as in the Tramore railway sidings and in Castle Street. There are a number of hospitals and similar benevolent institutions, including the leper house founded in the reign of King John, now used practically as an infirmary. The town possesses breweries, saltn- houses, foundries and flour-mills; and there is a large export trade in cattle, sheep and pigs, and in agricultural produce. It is the headquarters of extensive salmon fisheries. Waterford is second in importance to Cork among the ports of the south coast of Ireland. There is regular communication by steamer with Cork, with Dublin and Belfast, with Fishguard, Glasgow, Liverpool, Bristol, Plymouth, Southampton, London and other ports. Local steamers ply to Duncannon, New Ross and other places on the neighbouring estuaries. Waterford Harbour is a windsing and well-sheltered bay formed by the estuary of the river Suir, and afterwards by the joint estuary of the Nore and Barrow. Its length to the sea is about 15 m. Its entrance is 3 m. wide, and is lighted by a fixed light
WATERFORD—WATERHOUSE, J. W.

on the ancient donjon of Hook Tower (130 ft. in height) and others. The quay, at which there is a depth of 22 ft. of water at low tide, was enlarged in 1705 by the removal of the city walls, and is about 1½ m. in length. At Ferrybank, on the Kilkenny side of the river, there is a shipbuilding yard with patent slip and graving dock. By the Suir there is navigation for barges to Clonmel, and for sailing vessels to Carrick-on-Suir; by the Barrow for sailing vessels to New Ross and thence for barges to Athy, and so to Dublin by a branch of the Grand Canal; and by the Nore for barges to Inistioge. The shores of the harbour are picturesque and well-wooded, studded with country residences and waterside villages of which Cuffesgrange and Duncannon are popular resorts of the citizens of Waterford.

Anciently Waterford was called Cuan-na-groith, the haven of the sun. By early writers it was named Menapia. It is supposed to have existed in very early times, but first acquired importance under the Danes, of whom it remained one of the principal strongholds until its capture by Strongbow in 1171. On the 18th of October 1172 Henry II. landed near Waterford, and here received the hostages of the people of Munster. It became a cathedral city in 1166. The Protestant dioceses of Cashel, Elphin, and Limerick were lost there, and its cathedral became that of John, afterwards king of England, who had been declared lord of Ireland in 1177, landed at Waterford in 1185. After ascending the English throne he granted it a fair in 1204, and in 1206 a charter of incorporation. He landed at Waterford in 1210, in order to establish within his nominal territories in Ireland a more distinct form of government. The city received a new charter from Henry III. in 1232. Richard II. landed at Waterford in October 1394 and again in 1399. In 1447 it was granted by Henry VI. to John Talbot, earl of Shrewsbury, who was created earl of Pembroke in 1461. In 1447 it successfully resisted an attempt of Perkin Warbeck to capture it, in recognition of which it received various privileges from Henry VII., who gave it the title of urbs intacta. In 1603, after the accession of James I. to the English crown, the city, along with Cork, took a prominent part in opposition to the government and to the Protestant religion, but on the approach of Mountjoy it formally submitted. From this time, however, the magistrates whom it elected refused to take the oath of supremacy, and, as by its charter it possessed the right to refuse admission to the king’s judges, and therefore to dispense with the right of holding assizes, a rule was obtained in the Irish law courts for the seizure of its charter, which was carried into effect in 1618. In 1610 an attempt was made to induce Bristol merchants to settle in the city and undertake its government, but no one would respond to the invitation, and in 1626 the charter was restored. The city was unsuccessfully attacked by Cromwell in 1649, but surrendered to Ireton on the 10th of August 1650. After the battle of the Boyne James II. embarked at it for France (July 1690). Shortly afterwards it surrendered to William, who sailed from it to England. It sent two members to parliament from 1574 to 1855, when the number was reduced to one. In 1808 it was constituted one of the six county boroughs having separate county councils.

WATERFORD, a village of Saratoga county, New York, U.S.A., on the W. bank of the Hudson river, near the mouth of the Mohawk river, and about 10 m. N. of Albany. Pop. (1900) 3146, of whom 474 were foreign-born; (1905) 3134; (1910) 3245. Waterford is served by the Delaware & Hudson railway, and is at the junction of the Erie and the Champlain divisions of the great barge canal connecting Lake Erie and Lake Champlain. There was a settlement here probably as early as 1630, and Waterford was laid out in 1784, and was incorporated as a village in 1794.

WATERHOUSE, ALFRED (1830-1905), English architect, was born at Liverpool on the 10th of July 1830, and passed his professional pupilage under Richard Lane in Manchester. His earliest commissions were of a domestic nature, but his position as a designer of public buildings was assured as early as 1859 by success in the open competition for the Manchester assize courts. This work marked him not only as an adept in the planning of a complicated building on a large scale, but also as a champion of the Gothic cause. Nine years later, in 1868, another competition secured for Waterhouse the execution of the Manchester town-hall, where he was able to show a firmer and perhaps more original handling of the Gothic manner. The same year brought him the rebuilding of part of Caius College, Cambridge, not his first university work, for Balliol, Oxford, had been put into his hands in 1867. At Caius, out of deference to the Renaissance treatment of the older parts of the college, the Gothic element was intentionally mingled with classic detail, while Balliol and Pembroke, Cambridge, which followed in 1871, may be looked upon as typical specimens of the style of his mid career—Gothic with a touch of the Italian Renaissance. In Bury St. Edmunds, there were again marked attempts at form and design and adaptation to modern needs. Girton College, Cambridge, a building of simpler type, dates originally from the same period (1870), but has been periodically enlarged by further buildings. Two important domestic works were undertaken in 1870 and 1871 respectively—Eaton Hall for the duke, then marquis, of Westminster, and Heythrop Hall, Oxfordshire, the latter, a restoration, being of a fairly strict classic type. Iwerne Minster for Lord Wolverton was begun in 1877. In 1865 Waterhouse had removed his practice from Manchester to London, and in 1870, when he was appointed architect to the Royal Courts of Justice. He received from the government, without competition, the commission to build the Natural History Museum, South Kensington, a design which marks an epoch in the modern use of terra-cotta. The new University Club—a Gothic design—was undertaken in 1866, to be followed nearly twenty years later by the National Liberal Club, a study in Renaissance composition. Waterhouse's series of works for Victoria University, of which he was made LL.D. in 1890, dated from 1870, when he was first engaged on Owens College, Manchester; the St. Peter's Ferrybank, was begun in 1879, and Liverpool University College in 1885. St. Paul's School, Hammersmith, was begun in 1881, and in the same year the Central Technical College in Exhibition Road, London. Waterhouse's chief remaining works in London are the new Prudential Assurance Company's offices in Holborn; the new University College Hospital; the National Provincial Bank, Piccadilly, 1892; the Surveyors' Institution, Great George Street, 1896; and the Jenner Institute of Preventive Medicine, Chelsea, 1893. For the Prudential Company he designed many provincial branch offices, while for the Canadian Bank he also designed premises at Manchester. The Liverpool Institute, Waterhouse's largest hospital; and St. Mary's Hospital, Manchester, the Alexandra Hospital, Rhyll, and extensive additions at the general hospital, Nottingham, also engaged him. Among works not already mentioned are the Salford gaol; St Margaret's School, Bushley; the Metropole Hotel, Brighton; Hove town-hall; Alloa town-hall; St Elizabeth's church, Reddish; the Weigh House chapel, Mayfair; and Hutton Hall, Yorks. He died on the 22nd of August, 1905.

Waterhouse became a fellow of the Royal Institute of British Architects in 1861, and president from 1888 to 1901. He obtained a grand prix for architecture at the Paris Exposition of 1867, and a Rappel in 1876. In the same year he received the Royal Gold Medal of the Royal Institute of British Architects, and was made an associate of the Royal Academy, of which body he became a full member in 1885 and treasurer in 1898. He became a member of the academies of Vienna (1886), Brussels (1886), Antwerp (1887), Milan (1888) and Berlin (1889), and a corresponding member of the Institut de France (1893). After 1886 he was constantly called upon to act as assessor in architectural competitions, and was a member of the international jury appointed to judge the designs for the west front of Milan Cathedral in 1887. In 1890 he served as architectural member of the Royal Commission on the proposed enlargement of Westminster Abbey as a place of burial. From 1891 to 1902 his work was conducted in partnership with his son, Paul Waterhouse.

WATERHOUSE, JOHN WILLIAM (1847— ), English painter, was the son of an artist, by whom he was mainly trained. As a figure-painter he shows in his work much imaginative power and a very personal style, and his pictures are for the most part illustrations of classic myths treated with attractive fantasy. An able draughtsman and a fine colourist, he must be ranked among the best artists of the British school. He was

elected an associate of the Royal Academy in 1885 and academ-

WATER-LILY, a name somewhat vaguely given to almost any floating plant with conspicuous flowers, but applying more especially to the species of Nymphaea, Nuphar, and other members of the order Nymphaeaceae. These are aquatic plants with thick fleshy rootstocks or tubers embedded in the mud, and throwing up to the surface circular shield-like leaves, and leafless flower-stalks, each terminated by a single flower, often of great beauty, and consisting of four segments, Carpals, and numerous oval or round petals, clasping into the very numerous stamens without any definite line of demarcation between them. The ovary consists of numerous carpels united together and free, or more or less embedded in the top of the flower-stalk. The ovary has many cavities with a large number of ova exclusively attached to its walls, and is surmounted by a flat stigma of many radiating rows as in a poppy. The fruit is berry-like, and the seeds are remarkable for having their embryo surrounded by an endosperm as well as by a perisperm. The anatomical construction of these plants presents many peculiarities. There is, in the distribution of the flowers, a notable alternation of the order among the dicotyledons or among the monocotyledons, the general balance of opinion being in favour of the former view. The leaf-stalks and flower-stalks are traversed by longitudinal air-passages, whose disposition varies in different species. The species of Nymphaea are found in every quarter of the globe. Their flowers range from white to rose-coloured, yellow and blue. Some expand in the evening only, others close soon after noon. Nymphaea alba (Castalia alba) is common in some parts of Britain, as is also the yellow Nuphar luteum (Nymphaea lutea). The seeds and the rhizomes contain an abundance of starch, which renders them serviceable in some places for food.

Of recent years great strides have been made in the culture of new varieties of water-lilies in the open air. Many beautiful Nymphaea hybrids have been raised between the tender and hardy varieties of different colours, and there are now in commerce lovely forms having not only white, but also yellow, rose, pink and carmine flowers. In many gardens open-air tanks have been fitted up with hot-water pipes running through them to keep the water sufficiently warm in severe weather. Open-air tanks in the Royal Gardens, Kew, is one of the latest and most up-to-date in construction. These coloured hybrids were originated by M. Latour Marliac, of Temple-sur-Lot, France, some of the most favoured varieties being carnea, chromo-
tella, flavomea, ignea, rosea, Robisoni, Aurora, blanda, &c.

Amongst hardy species of Nymphaea now much grown are candida, nuda, odorata, pygmaea and tuberosa, all with white, more or less sweet-scented flowers; flavo, yellow, and sphaerocephala, rose-carmine. Amongst the tender or hothouse Nymphaea the following are most noted: blando, white; devoennis, scarlet (a hybrid between N. Lotus and N. rubra); alba, white; elegans, yellowish white and purple; gigantes, blue; kemensis, rose-carmine (a hybrid between N. devoennis and N. Lotus); Lotus, red, white; pubescens, white; scutio, bright blue; stellata, blue, with several varieties; and Sundara, rose-carmine, Chiefs of the ancient Egyptian and Arabian empires, and the Roman emperors, were all fond of the lotus. It is still cultivated in Egypt and the Levant, as a means of purifying the body and the mind. Under the general head of water-lily are included the lotus of Egypt, Nymphaea lotus, and the sacred lotus of India and China, Nelumbium speciosum, formerly a native of the Nile, as shown by Egyptian sculptures and other evidence, but no longer found in that river. The gigantic Victoria regia, with leaves 6 to 7 ft. in diameter and flowers 8 to 16 in. across, also belongs to this group. It grows in the backwaters of the Amazon, often covering the surface for miles; the seeds are eaten under the name water maize.

WATERLOO, a city and the county-seat of Black Hawk county, Iowa, U.S.A., on the Cedar river, about 90 m. W. of Dubuque and about 275 m. W. of Chicago. Pop. (1890) 6,674; (1900) 12,880, of whom 13,311 were foreign-born; (1910) census 26,093. It is served by the Illinois Central (which has large connecting lines) and the Missouri, Kansas & Pacific, the Chicago Great Western, and the Waterloo, Cedar Falls & Northern (from Cedar Falls to Sumner) railways. The city has several public parks, a public library (1879) with two buildings, a Y.M.C.A. building, and a good public school system, including a manual training school. There is a Chauteau park. The river here is 700 to 900 ft. wide; its clear water flows over a limestone bed through a rather evenly sloping valley in the middle of the city with enough fall to furnish valuable water power. The value of the factory product in 1905 was $6,000,000. The city is situated in a highly fertile and productive region, and is an important shipping point. Waterloo was first settled about 1846, was laid out in 1854, first chartered as a city in 1868, and became a city of the first class in 1895.

WATERLOO CAMPAIGN, 1815. On February 27, 1815, Napoleon set sail from Elba with his force of 1000 men and 4 guns, determined to reconquer the throne of France. On March 1 he landed near Cannes, and proceeded at once to march on Paris. He deliberately chose the difficult route over the Alps, and further, his recognition that his opponents would neither expect him by this route nor be able to concert combined operations in time to thwart him. Events proved the wisdom of his choice. He advanced to Paris was a series of triumphs, his power waxing with every league he covered, and when he reached Paris the Bourbons had fled. But he had soon to turn his attention to war. His sudden return, far from widening the breaches between the allies, had fused them indissolubly together, and the four powers bound themselves to put 150,000 men apiece under arms and to maintain them in the field until Napoleon had been utterly crushed. So, from the first, France was engaged in another war against an affrighted and infatuated Europe, a war in which the big battalions would be on the side of the Seventh Coalition; and to oppose their vast armies Napoleon only had in March the 150,000 men he had taken over from Louis XVIII. when the Bourbon hurriedly quitted the throne. Of this force the emperor could have drawn together some 50,000 men within ten days and struck straight at the small allied forces that were in Belgium at the moment. But he wisely refrained from taking the immediate offensive. Such an act would have proved that he desired, nay provoked a war; and further, the engagement of such small forces could lead to no decisive results. Napoleon therefore stayed his hand and proceeded to hasten forward the organization, almost the creation of an army, with which he could confront the coalition. Meanwhile he sought to detach Great Britain and Austria from the alliance. But he did not permit his political enterprise to stay his military preparations; and, by constant attention to the minutest details, by June 1 he had got together an army of 360,000 for the defence of France, one half of which was available for field service. In this army were 36,000 French and 25,000 German soldiers; for he had no allies. On his return from Elba it is true that Murat, the king of Naples, took his side; but recklessly opening an offensive campaign, Murat was beaten at Tolentino (May 2-3), and he found himself compelled to fly in disguise to France, where the emperor refused him an audience or employment. Herein Napoleon wronged France, for he deprived her of the most brilliant cavalry soldier of the period. Shorn thus of his single ally, the emperor realized that the whole eastern land-frontier of France was open to invasion, from the North Sea to the Mediterranean. By the end of May he had placed his forces as follows to protect his empire:

- D'Erlon's I. Corps cantonated between Lille and Valenciennes.
- Reille's II. Corps cantonated between Valenciennes and Avesnes.
- Vandamme's III. Corps cantonated around Royen.
- Bernadotte's IV. Corps cantonated at Metz.
- Lobau's VI. Corps cantonated at Laon.
- Grouchy's Cavalry Reserve at Guise.
- Marshal Mortier with the Imperial Guard at Paris.
- Rapp with the V. Corps (25,000) near Strassburg.

18,500 more troops under Suchet, Brune and Lecourbe guarded the S.E. frontier from Basel to Nice, and covered Lyons; 3000 men under Clausel and Desaix guarded the Pyrenean frontier; whilst Lamarque led 10,000 men into La Vendée to quell the insurrection in that quarter. In 1815 Napoleon was not supported by a united and unanimous France; the country
was weakened by internal dissensions at the very moment when it was needful to put every man in line to meet the rising tide of invasion surging against the long curving eastern frontier.

Napoleon now pondered over his plan of campaign. In Belgium, across an almost open frontier, lay an ever-increasing force of Anglo-Dutch and Prussian troops under Wellington and Blücher. The Rhine frontier was threatened by Schwarzenberg's Austrians (270,000); Barclay de Tolly's Russians (150,000) were slowly coming up; and another Austrian force menaced the S.E. frontier of France. The allies determined that they would wage a war without risks, and they were particularly anxious to avoid the risk of defeat in detail. It was accordingly arranged that Wellington and Blücher should await in Belgium the arrival of the Austrian and Russian masses on the Rhine, about July 1, before the general invasion of France was begun. Thereafter, whatever befell, the allied armies would resolutely press forward towards Paris, affording each other mutual support, and with the tremendous weight of troops at their disposal thrust back Napoleon upon his capital, force him to fight in front of it, and drive him when defeated within its works. The end would then be in sight. Thus they had planned the campaign, but Napoleon forestalled them. In fact, the threatening danger forced his hand and compelled him to strike before he had collected a sufficient army for his defensive needs. Consequently he determined to advance swiftly and secretly against Wellington and Blücher, whose forces, as Napoleon knew, were dispersed over the country of their unenthusiastic ally. Thus he designed to crush a part of the coalition before the Russians and Austrians poured over the eastern frontier. Once Wellington and Blücher were destroyed he would move southwards and meet the other allies on the Rhine. He might thus compensate for his numerical inferiority by superior mobility and superior leadership.

His information showed that Wellington held the western half of Belgium from the Brussels-Charleroi road to the Scheldt, that his base of operations was Ostend, and that his headquarters were at Brussels. Blücher, based on the Rhine at Coblenz, held the eastern half from the Brussels-Charleroi road to the Meuse, and had his headquarters at Namur. The emperor was convinced that nothing could be gained by invading Belgium from the S.E. or W.; such a stroke would surely drive the allies together, and that was never Napoleon's plan. On the other hand, if he struck straight at Charleroi—the allied junction point—he would drive the "Armée du Nord" like an armoured wedge between the allies, if only he caught them unsuspecting and unready. Forced asunder at the outset, each would (in all probability) fall back along his own line of communication, and the gap thus made between the allies would enable the emperor to manoeuvre between them and defeat them in turn. To gain the best chance of success he would have to concentrate his whole army almost within gunshot of the centre of the enemies' outposts without attracting their attention; otherwise he would lose the allies concentrated and waiting for him.

Wellington and Blücher were disposed as follows in the early days of June (Map I). The Anglo-Dutch army of 93,000 with headquarters at Brussels were cantoned: I. Corps (Prince of Orange), 30,200, headquarters Braine-le-Comte, disposed in the area Enghien-Genappe-Mons; II. Corps (Lord Hill), 27,300, headquarters Ath, distributed in the area Ath-Oudenarde-Ghent; reserve cavalry (Lord Uxbridge) 9000, in the valley of the Dendre river, between Grammont and Ninove; the reserve (under Wellington himself) 25,000, lay around Brussels. The frontier in front of Leuze and Binche was watched by the Dutch-Belgian light cavalry.
The opposing armies were of very different quality. Wellington's was a collection of many nationalities; the kernel being composed of his trusty and tenacious British and King's German Legion troops, numbering only 42,000 men. Of the remainder many were far from enthusiastic in the cause for which they had perforce to take up arms, and might prove a source of weakness should victory incline to the French eagles. Blücher's army was undoubtedly more homogeneous, and though it is doubtful if possibly any two corps of Wellington's were the best of the rest, on the other hand he had no specially weak elements.

Napoleon was at the head of a veteran army of Frenchmen, who worshipped their leader and were willing to die for France if necessity demanded. But there were lines of weakness, too, in his army. He had left Marshal Davout behind in Paris, and Murat in disgrace; Suchet was far off on the eastern frontier, and Clausewitz was in the south of France. The political reasons for these arrangements may have been cogent, but they injured France at the very outset. Marshal Soult was appointed chief of the staff, a post for which he possessed very few qualifications; and, when the campaign began, command of the left and right wings had perforce to be given to the only two marshals available, Ney and Grouchy, who did not possess the ability or strategic skill necessary for such positions. Again, the army was morally weakened by a haunting dread of treason, and some of the chiefs, Ney for example, took up the field with disturbing visions of the consequences of their late betrayal of the Bourbon cause, in case of Napoleon's defeat. Finally, the army was too small for its object. Herein Napoleon showed that he was no longer the Napoleon of Austerlitz; for he left locked up in far-distant secondary theatres 26,000 men, of whom he had collected some 30,000 to 36,000 for the decisive campaign in Belgium. Had he made in 1813 the wise distribution of his soldiers in the theatre of war which he made in his former immortal campaigns, he would have concentrated 155,000 to 160,000 of his available force opposite to Charleroi on June 14, and the issue of the campaign would hardly have been in doubt. But he failed to do so, and by taking the field with such inferior numbers he left too much to Fortune.

For his advance into Belgium in 1815 Napoleon divided his army into two wings and a reserve. As the foe would lie away to his right and left after he had passed the Sambre, one wing and a reserve would be pushed up towards Wellington and another towards Blücher; whilst the mass of the reserve would be centrally placed so as to strike on either side, as soon as a force of the enemy worth destroying was encountered and gripped. To this end he had, on the 14th, massed his left wing (Reille and D'Erlon) around Solre, and his right wing (Gérard) at Philippeville; whilst the central mass (Vandamme, Lobau, the Guard and the Cavalry Reserve) lay around Beaumont.

The orders for the French advance next day, among the finest ever issued, directed that the army should march at dawn and move to the Sambre at Marchienne and Charleroi. By evening it was expected that the whole would have crossed the Sambre, and would bivouac between the sunned allies. But at the very outset delays occurred. Owing to an accident that befell the single orderly despatched with orders for Vandamme, the III. Corps remained without other definite orders than those issued on June 13, warning them to be ready to move at 3 A.M. The corps therefore stood fast on the morning of June 15, awaiting further instructions. This was the more unfortunate as Vandamme was destined to lead the advance on Marchienne by the centre road. But the emperor regarded it merely as "an unfortunate accident," nothing more, and the advance in two wings and a reserve continued, undisturbed by such occurrences. Gérard, too, was late in starting, for his corps had not been fully concentrated over-night. Zieten's outposts on the right bank of the Sambre gained still further time, for they fought stubbornly to retard the French advance on Marchienne and Charleroi. But Zieten declined, and very wisely, to fight on the right bank, and he made the most of the screen afforded by the little river. He had to delay the French advance for 24 hours.
and give time for Blücher's concentration, at the same time retaining his own freedom of manœuvre, and this in spite of the great length of the summer day, the short distance that he lay in front of Fleurus, the tremendous numerical superiority of the French and Napoleon's personal presence at their head. When the French left wing and centre reached the Sambre bridges, Marchiennes and Charleroi, they found them held and strongly barricaded, and the cavalry were powerless to force the passage, and forced to remain behind only to reconnoitre the enemy's position in front of the Young Guard, whom he had personally hurried forward. He immediately took action, and under his direction the bridge at Charleroi was stormed shortly after noon. Almost at the same time Reille forced the passage at Marchiennes. Instead of drawing his corps together and retreating en masse up the Fleurus road, Zieten wisely withdrew on two roads, using those to Quatre Bras and Fleurus. The defenders of Marchiennes used the former, while the brigade which had held Charleroi fell back by the latter. The emperor at once began the advance along both the roads. The left wing went up the Gosselies-Quatre Bras road, and Pajol's cavalry followed the Prussians who retired along the Gilly-Fleurus road. The emperor took post at Charleroi. About 3 P.M. Marshal Ney joined the army, was given the command of the left wing, and ordered to drive the Prussians out of Gosselies, and clear the road northward of that place. Ney took over his command just when the attack on Gosselies was impending. The Prussians were driven from the town, but they managed to effect a roundabout retreat to Ligny, where they rallied. Ney pushed on his advance up the Brussels road. When he had left the front, the emperor proposed to Ney to recommend the Prussian position at Gilly; and handing over the command of the right wing to the marshal, whom he ordered to capture Gilly, Napoleon returned to Charleroi, to hasten the passage of the French army across the Sambre and mass it in the gap between the allies. But the head of Vandamme's corps had by this time crossed the river, and the emperor ordered it to assist Grouchy.

What meanwhile were the allies doing? There is no doubt that, surprised by the suddenness of the French advance, they were caught unprepared. But on the 15th the critical nature of the situation dawned on them, and naturally on Blücher first, as his headquarters were nearer to the frontier than Wellington's, and Blücher had had previous experience of Napoleon's powers. As soon as the Prussian marshal got the first real warning of imminent danger, he ordered (in accordance with the pre-arranged plan) an immediate concentration of his army on his inner flank at Sombreffe. Unfortunately for him the first orders sent to Bülow by Gneisenau, chief of the staff, at midnight June 14-15, were written in so stilted and hazy a style that Bülow did not consider any special display of energy was required. Hence the IV. Corps was not in the field after the 16th. The other two corps commanders (Pirch I. and Thielmann) received clearer orders, and acted promptly enough. They concentrated their scattered men and hastened to march to the appointed rendezvous. By nightfall Pirch I. had bivouacked the II. Corps at Mazy, only 4 m. short of Sombreffe, and Thielmann and the III. Corps had reached Namur, within easy distance of the Ligny battleground. Blücher wisely shifted his own headquarters to Sombreffe on the afternoon of the 15th.

Wellington's position at nightfall was very different, and can hardly be termed safe or even satisfactory. Definite news of the French advance only reached Brussels about 3 P.M. on the 15th; and even then the duke was by no means certain of the direction of Napoleon's main stroke. Hence the first orders he issued were for his divisions to concentrate at their respective alarm-posts, intending later to send them further orders when the situation had somewhat cleared up. For whatever reasons, Wellington thought Napoleon would attempt to turn his right and cut his line of communications. Had Napoleon attempted this he would (if successful) have driven the Anglo-Dutch army back from the Prussians, instead of separating the allies, as he actually tried to do but very nearly succeeded in doing. Failing to appreciate this fully, Wellington omitted to order an immediate concentration on his inner (left) flank as Blücher had done, and the danger of Blücher's position was thus enormously increased. Curiously enough, the allies do not appear to have decided upon the course to be taken in case they were surprised, as they virtually were, and their system of intercommunication—if system it can be called—was most imperfect. They ought to have arranged loyally and promptly to let each other know every move it was proposed to make and the reasons for moving, for not only was Blücher's advance a surprise, but there was a general opinion that the French forces were not large enough or strong enough to make a decisive action. Wellington was not aware of this belief, nor was it shared by him.

Wellington's subordinates at the critical point, however, acted with admirable boldness. Prince Bernard, in command of a brigade at Quatre Bras and Frasnes, recognizing the pressing danger that threatened on the Brussels road, retained his position there to check the French advance, instead of driving off westwards and massing with the rest of his division at Nivelles; and in this action he was firmly supported by his immediate superior. It was due to their presence of mind that Wellington maintained his hold on the important strategic point of Quatre Bras on June 15 and 16. Consequently, as Ney's wing advanced northward from Gosselies along the Brussels road, it came upon an advanced detachment of this force at Frasnes. The detachment was quickly forced to retire on its supports at the cross-roads, but here Prince Bernard firmly held his position; and by his skilful use of cover and the high standing corn he prevented the French gauging the weakness of the small force that barred their way. The day was now drawing to a close, and Ney decided wisely not to push his advance any farther. He was in truth in a force of untrained strength which appeared resolved still to stand its ground, his men were tired, and the cannon-thunder to his right rear proclaimed clearly that Grouchy had not made much headway on the Fleurus road. To push on farther might isolate the left wing among a host of allies. He therefore halted his command, and, later, made a report to the emperor.

Meanwhile two long hours had been wasted on the right whilst Grouchy and Vandamme deliberated over their plan of action in front of the Prussian brigades at Gilly; and it was not until the emperor himself again reached the front, about 5.30 P.M., that vigour replaced indecision. There was a brief bombardment, and then Vandamme's corps was sent forward with the boyau to drive out the foe. The shock was too great; the Prussians gave way immediately and were chased back into the woods by cavalry. Grouchy now pushed on towards Fleurus, which was still held by Blücher's troops, and there the advance came to a halt, as the light was failing and the troops exhausted.

Thus, thanks to Zieten's fine delaying action, Blücher by nightfall on June 15 had secured most of the ground requisite for his pre-arranged concentration; for one corps was in position, and two others were at hand. Bülow's corps was unavailable, for the reason already given, but of this fact Blücher was still necessarily ignorant. Wellington, owing to his original dispositions and the slowness of his concentration, had only retained a grip on Quatre Bras thanks to the boldness of his subordinates on the spot. His other troops were assembling: I. Corps, Nivelles, Braine-le-Comte and Enghien; II. Corps, Ath, Grammont and Sotteghem; heavy cavalry at Ninove; Reserve at Brussels. During the night of the 15th orders were sent for the divisions to move eastwards towards Nivelles, and at dawn the Reserve marched for Mt. S. Jean. Thus Wellington did not even yet realize the full significance of the emperor's opening move.

But if the intelligence which the duke rightly relied on had come to hand on the 15th, it cannot be doubted that he would have effected a more expeditious concentration on his inner flank. His trusted intelligence officer, Colonel Colquhoun Grant, was at this time in France, and it had been arranged that his reports should be received at the duke's outposts by General Dörnberg, for transmission to the duke. On June 15 Grant wrote to Wellington stating that the French were advancing, and that French officers spoke freely about a decisive action being fought within three days. But Dörnberg, arrogating to himself the right
of selecting the reports which were worth forwarding, sent it back, saying that, so far from convincing him that the emperor was advancing to give battle, it assured him of the contrary. Owing to this officer's presumptuous folly, the Grant's information only reached the duke on June 18, too late to be of use.

The Army of the North on this night was disposed as follows:—The left wing stretched from Frasnes back to the Sambre at Marchienne and Thuin. Reille's corps was to the front and was covered by the light cavalry of the Guard and Pirlé's lancers. Ney's headquarters were at Gosselies; one division (Girard's) was at Wangenies and acted as a link between the two wings. The right wing, under Grouchy, had come to a halt in front of Flers. It was covered by Fajol's and Exelmans' cavalry corps. Vandamme's was the leading infantry corps, and it hivedacked with its head at Winage. Gérard's corps (with which was Kellermann's cuirassier corps) halted astride the Sambre at Chatelet. Gérard's advance had been delayed owing to the commander of his leading division deserting with his staff to the Prussians. Consequently the IV. Corps had not assisted at all in the passage of the river; though it had only been present, it would have been magnificently placed to co-operate with Grouchy in the action of Gilly. Thus each of these strategical covering forces was itself protected by an adequate tactical and guard framework as protection for local protection. The centre (or reserve) was meanwhile disposed as follows: The Guard was bivouacked between Gilly and Charleroi; the emperor's headquarters being at the latter place. Milhaud's Cuirassier corps and Lobau's (VI.) corps were south of the Sambre, between Charleroi and Jamioux. In this particular the execution on June 15 fell short of the original conception, for at nightfall about one-third of the French army was still on the right bank of the river. This, however, signified little, for the emperor still occupied a dominant strategical position.

Napoleon had now perfected his arrangements for the invasion of Belgium, and his army was organized definitely in two wings and a reserve; the latter being so placed that it could be brought "into action on either wing as circumstances dictated." As circumstances dictated, either wing would fasten upon one of the allied armies and detain it until the reserve had time to come up and complete its destruction; the other wing meantime detaining the other allied army and preventing its commander from coming to his colleague's assistance. The emperor was not in possession of the Namur-Nivelles road. The allies were thus afforded an opportunity of combusting the very blunder which Napoleon looked for, namely to force a gap at a risky point of concentration. His dispositions on the night of the 15th-16th were skillfully calculated to encourage the allies to mass at Quatre Bras and Sommelle, and his covering force were pushed sufficiently forward—to Frasnes and Fleurus—to grip whichever way Napoleon had ventured his army first. At nightfall the Army of the North lay concentrated in a square whose sides measured 12 m. each; and it could with equal facility swing against the Prussians or the Angle-Dutch, and was already placed between them.

Early on the morning of June 16 Prince Blücher was reinforced at Quatre Bras by the rest of his division (Perponcher's) and Wellington's other troops were now all on the march eastward except the reserve, who were heading southwards and halted at the cross-road of Mt. S. Jean until the duke had resolved that their objective should be Quatre Bras. They then marched in that direction. Blücher meanwhile was making his arrangements to hold a position to the south of the Namur-Nivelles road and thus maintain uninterrupted communication with Wellington at Quatre Bras. In this way he would keep open the Namur road, and so threaten Napoleon's army.

Napoleon spent the early morning in closing up his army, and writing what proved to be the most important letter of the campaign to Ney (Charleroi, about 8 A.M.): "I have adopted as the general principle for this campaign to divide my army into two wings and a reserve. . . The Guard will form the reserve, and I shall bring it into action on either wing just as circumstances dictate. . . According to circumstances I shall weaken one wing to strengthen my reserve. . ." Here, in its simplest form, is the principle that underlies Napoleon's strategy in 1815. Only on the wing on which the reserve is brought into action will a decisive result be aimed at. The other is to be used exclusively to neutralize the other enemy, by holding him at bay.

Napoleon's original plan for the 16th was based on the assumption that the allies, who had been caught napping, would not attempt a risky forward concentration; and he intended therefore to push an advanced guard as far as Gembloux, for the purpose of 'giving a feel down' and forcing Blücher. To assist this operation the reserve would move at first to Fleurus to reinforce Grouchy, should he need assistance in driving back Blücher's troops; but, once in possession of Sommere, the emperor would swing the reserve westwards and join Ney, who it was supposed, would have in the meantime mastered Quatre Bras. In pursuance of this object Ney, to whom Kellermann was named to command, was to mass at Quatre Bras and push an advanced guard 6 m. northward of that place, with a connecting division at Marbais to link him with Grouchy. The centre and left wing together would then make a night-march to Brussels. The allies would thus be irretrievably sanded, and all that remained would be to destroy them in detail. Napoleon now awaited further information from his wing commanders at Charleroi, where he massed the VI. Corps (Lobau), to save, if possible, from a massacre. He considered it probable that it would only be wanted for the march to Brussels. Ney sent the morning in massing his two corps, and in reconnoitering the enemy at Quatre Bras, who, as he was informed, had been reinforced. But up till noon he took no serious step to capture the cross-roads, which then lay at his mercy. Grouchy meantime reported from Fleurus that Prussian masses were coming up from Namur, but Napoleon does not appear to have attached much importance to this report. He was still at Charleroi when, between 9 and 10 A.M., further news reached him from Lobau that considerable forces were visible at Quatre Bras. He at once wrote to Ney saying that a battle was on, there were to be some of Wellington's troops, and that Ney was to concentrate his force and crush what was in front of him, adding that he was to send all reports to Fleurus. Then, keeping Lobau provisionally at Charleroi, Napoleon hastened to Fleurus, arriving about 11. He found that Grouchy had made little progress beyond the town. As he surveyed the field from the windmill north of Fleurus it struck him as significant that Blücher's troops were disposed parallel to the Namur road, as if to cover a forward concentration, and not at right angles to it, as the French had done. Still, at that moment, only one corps was showing. Possibly, however, the decisive day of the campaign had come. By the emperor's arrangements Vandamme, Gérard, Fajol and Exelmans would be available after 2 P.M. to attack whatever force Blücher might command, and the Guard and Milhaud would be at hand to act as reserve. The wonder is that he did not now order Lobau to move to some intermediate position, such as Wangenies, where he would be available for either wing as circumstances dictated. At 2 P.M. Napoleon ordered Ney to master Quatre Bras, and added that the emperor would attack the corps which he saw in front of him. Whichever wing succeeded first would then wheel inwards and help the other. Not yet had Napoleon grasped the full significance of the allied movements, for the decisive flank had not yet become clear.

Blücher had already determined to fight. Meanwhile, Wellington, having reached Quatre Bras in the morning, wrote to him to concert the day's operations; then, as all was quiet in his front, he rode over to meet Blücher at Brye. The two chiefs, surveying the French army in their front, considered that no serious force was in front of Quatre Bras, and Wellington intimated the interview with the conditional promise that he would bring his army to Blücher's assistance at Ligny, if he was not attacked himself. This promise, of course, was never fulfilled, for Ney employed the duke all day at Quatre Bras; and, furthermore, the duke's tardy concentration made it quite impossible for him to help Blücher directly on the Ligny battlefield. On his return to Quatre Bras he found that a crisis had already been reached.
Ney had allowed the valuable hours to slip away when he could have stormed Quatre Bras with ease and ensured cooperation with his master. Remembering the surprises that the battles in Spain had provided for the marshals opposed to the duke, he massed nearly the whole of Reille’s corps before he advanced. The prince of Orange, in command at Quatre Bras, had only 7,500 troops. But by boldly scattering his force and by making use of the Bossu wood and the farms, he covered the cross-roads and showed a firm front to the very superior force which Ney commanded. It was then 2 P.M. The Dutch-Belgian troops to the east of the Brussels highway were at once forced back by the mass of men moved against them, and it looked as if the whole defence would crumple up. But about 3 P.M. timely succour reached the field—Van Merlen’s cavalry from Nivelles, Picton and the 5th division from Brussels—and Wellington returned and took over the command. Picton at once stopped the victorious French advance to the east of the road, but the remaining division (Jérôme) of Reille’s corps now reached the front and Ney flung it into the Bossu wood to clear that place and keep his left flank free. A fierce fight now broke out all along the line, in which Jérôme steadily made ground in the Bossu wood, while Picton showing a dauntless front maintained his position. The Brunswick contingent now reached the field, but their duke whilst leading a charge received a mortal wound and the attack failed. It was nearly 4.15 P.M. when Ney received Napoleon’s 2 P.M. order, and in obedience to it he made another attack, in which the Bossu wood was virtually cleared of its defenders. However, about 5 P.M. further reinforcements reached Wellington, Alten’s (3rd) division coming in from Nivelles. Ney now realized that he could only capture Quatre Bras with D’Erlon’s help.

But shortly afterwards (about 5.15) he heard that the I. Corps, without his direct order or knowledge, had moved eastwards to assist in the battle of Ligny. Immediately afterwards (about 5.30) he received an order from Napoleon to seize Quatre Bras and then turn eastwards to crush Blücher, who was caught at Ligny. Napoleon added, “The fate of France is in your hands.” Ney’s duty was merely to hold Wellington for certain at Quatre Bras and allow D’Erlon to carry out the movement which must ensure a decisive result at Ligny; in accordance with Napoleon’s plan of campaign. In any case D’Erlon could not come back in time to give him effectual help. But incapable of grasping the situation, and beside himself with rage, Ney sent imperative orders to D’Erlon to return at once, and immediately afterwards he ordered Kellermann to lead his one available cutassier brigade and break through Wellington’s line. The charge was admirably executed; it overthrew one British regiment which it caught in line, but being unsupported it achieved nothing further of importance, and was beaten back. When this attempt to master the cross-roads had ended in failure, Ney received a verbal message from the emperor, enjoining him that, whatever happened at Quatre Bras, D’Erlon must be allowed to carry out the movement ordered by the emperor. The bearer, Major Baudus, knowing the importance of the manœuvre which the I. Corps was carrying out, strove to induce Ney to reconsider D’Erlon’s recall; but the marshal refused and ended the discussion by plunging into the fight. Shortly afterwards (about 7 P.M.) Wellington received further reinforcements (Cook’s division of the British Guards), which brought his force up to 32,000 against Ney’s 22,000 men. The duke then attacked strenuously all along the line, and before darkness stopped the fight he drove back the French to their morning position at Frasnes. The losses were as follows: Anglo-Dutch 4,500, and French 4,300. At 9 P.M., when the battle was lost and won, D’Erlon’s corps arrived. It had already reached the edge of the Ligny battlefield when the counter-order arrived, and conceiving that he was still under Marshal Ney (for the officer who bore the pencil-note directing Ney to detach
D'Erlon, had on his own initiative ordered the I. Corps to the eastward) the general considered he ought to return to the left wing, and leaving one division at Wagnelée he withdrew his force. The incident was immeasurably unfortunate for the French. Had the I. Corps been thrown into the doubtful struggle at Quatre Bras, it must have crushed Wellington; had it been used at Ligny it would have entailed Blücher's annihilation. But oscillating between the two fields, it took part in neither. When the fighting was over, at 10 P.M., Ney had a short and somewhat one-sided account of the action to Soult.

On the other flank there had meanwhile been waged the bitterly fought battle of Ligny. As Blücher's dispositions gradually became clearer the emperor realized that the first decisive day of the campaign had actually come, and he promptly made arrangements for defeating the Prussian army in his front. Blücher, to cover the Namur road, held with the I. Corps the villages of Brye, St Amand and Ligny, whilst behind his centre was massed the II. Corps, and on his left was placed the III. Corps. Wellington and Blücher on arrival would act as general reserve. Blücher's army, as he finally disposed it, was quite visible to Napoleon on the bare open slopes which it occupied above St Amand and Ligny, the II. Corps being especially exposed. The emperor decided to bear down Blücher's centre and right with the corps of Vandamme and Gérard and with Girard's division which he had drawn into his operations, containing the Prussian left meanwhile with the squadrons of Payol and Exelmans, assisted by a few infantry. The Guard and Milhaud were in hand at Fleurus. Further, he could order up Lobau, and direct Ney to move his rearguard corps across and form a line of battle. When the battle was won, a move would crush the Prussian centre and right between the Guard and D'Erlon's corps.

It was a somewhat complicated manoeuvre; for he was attempting to outflank his enemy with a corps that he had subordinated to Marshal Ney. Much depended on whether Ney would grasp the full purport of his orders; in a similar case at Bautzen he had failed to so, and he failed as badly now. The usual Napoleonic simplicity was wanting at Ligny, and he paid in full for the want.

It was just after 2.30 P.M. when Napoleon, hearing the sound of Ney's cannon to the eastward and realizing that Wellington was galled and neutralized, commenced the battle at Ligny. Blücher's force was numerically very superior. The Prussians numbered about 83,000 men to Napoleon's 71,000 (including Lobau, who only came up at the end of the day). A fierce fight was soon raging for the villages. Vandamme and Girard attacked S. Amand, whilst Gérard attempted to storm Ligny; on the right Grouchy held Thielheimen in play, and in the centre near Fleurus were the Guard and Milhaud in reserve, close to the emperor's headquarters on the mill. At 3.15 P.M., when the battle was in full swing, Napoleon's in-division of the French was to engage "the fate of France is in your hands," and ordering the marshals to master Quatre Bras and move eastwards to assist at Ligny. Immediately afterwards, hearing that Ney had 20,000 men in front of him, he sent the "pencil note" by General La Bédoyère which directed Ney to detach D'Erlon's corps to Ligny. This, as we know, the A.D.C. in a fit of mistaken zeal took upon himself to do. Hence the corps appeared too soon, and in the wrong direction. But neither order made it sufficiently clear to Ney that co-operation at Ligny was the essential, provided that Wellington was held fast at Quatre Bras. In other words, Ney had merely to hold Wellington with part of the French army all day, and detach the remainder of his force to co-operate in the deathblow at Ligny. This is clear when we look at the letter Ney is studied with the orders, as it was meant to be; but Ney in the heat of action misread the later instructions. Meanwhile the emperor ordered Lobau to bring up his corps at once to Fleurus where he could hardly be of great service, whereas had he been directed to move on Wagnelée he might have co-operated in the last struggle far more efficiently. The fight for the villages continued to rage fiercely and incessantly, each side behaving as if its moral foe was in front. The villages were captured and recaptured, but generally the French had the better of the fighting, for they compelled Blücher to use up more and more of his reserves, and prevented the Prussians from breaking through to the southward of S. Amand. Eventually the fighting became so furious that the troops engaged literally melted away, particularly at Ligny, and the emperor was finally compelled to call on his reserve to replenish the troops first engaged. But hardly had the Young and Middle Guard marched off to reinforce Vandamme and Gérard, when Vandamme sent word that a hostile column, over 50,000 strong, was threatening the French left (in reality this was D'Erlon's corps). Vandamme's exhausted troops were unnerved at the sight of this fresh foe, and an incipient panic was only quelled by turning guns on the fugitives. It was now between 5.30 and 6. The emperor concluded that this could not be D'Erlon, because he had arrived too soon and was marching in an evidently wrong direction. He at once sent an officer to reconnoitre. Meanwhile the reinforcements which he had despatched were most opportune. The Prussians had seized the opportunity offered by the slackening of the French attacks at Fleurus and deliver a counterstroke, which was parried, after achieving a small measure of success, by the bayonets of the Young Guard. It was about 6.30 before Napoleon learned that the unknown force was actually D'Erlon's, and somewhat later he heard that it had counter-marched and withdrawn westwards. Repeated orders sent to the commander of the division left by D'Erlon failed to induce him to engage his command decisively, and thus Napoleon obtained no direct co-operation from his left wing on this, the first decisive day of the campaign. Thus relieved about his left, but realizing that D'Erlon had returned to his former position, he could no longer expect to destroy the Prussian army. Lobau's corps, too, was now arriving and forming up on the heights east of Fleurus. The artillery of the Guard, therefore, came into action above Ligny to prepare Blücher's centre for assault. Some delay was occasioned by a thunderstorm; but, as this passed over, the guns opened and the Old Guard and Milhaud's cuirassiers proceeded to form up opposite to Ligny. About 7.45 P.M. a crashing salvo of 60 guns gave the signal for a combined assault to be delivered by Gérard and the Guard, with Milhaud moving on their right flank. Blücher's worn-out soldiers could not withstand the tremendous impact of Napoleon's choicest troops, and the Prussian centre was pierced and broken. But the gallant old marshal still had some fresh squadrons in hand, and he promptly launched them to stem the French advance. While leading one of the charges in person his horse was shot and fell under him, but he was rescued and borne in a semi-conscious condition from the field. Without doubt, the personal risk to which Blücher exposed himself at this crisis was far too great; for it was essential that the command of the Prussian army should remain vested in a chief who would loyally keep in touch and act entirely in concert with his colleague. In this way only could the allies hope to obtain a decisive success against Napoleon.

By 9 P.M., the main battle was already over, and Napoleon could see the French streaming resistlessly forward. Napoleon was master of Blücher's battlefield, and the beaten Prussians had retired to the north of the Namur-Nivelles road. Under the circumstances, the late hour, the failing light and the lack of information as to events on the left wing, immediate pursuit was out of the question.

The execution had again fallen short of the conception; Blücher though beaten was not destroyed, nor was his line with Wellington cut. If the Prussians now retired northwards, parallel to the direction which Wellington would follow perfectly, to-morrow, the scope of co-operating in a decisive battle would still remain to the allies; and Gneisenau's order issued by moonlight, directing the retreat on Tilloy and Wavre, went...
far to ensuring the possibility of such combined action. However, Gneisenau was very remiss in not immediately reporting this vital move and the necessity for it to the duke, as it left the Anglo-Dutch inner flank quite exposed. Gneisenau apparently selected Wavre, not with the intention of assisting his ally, but rather to re-establish his own line of communication, and the presence of the Prussians on the field of battle at Waterloo must be put down to the immortal credit of Blücher and Grolmann, his quartermaster-general. Gneisenau at this crisis in the affairs of the allies does not appear to have subordinated everything to the one essential of manoeuvring so as to remain in communication with Blücher. It was 2 A.M. on June 18 before he received the answer to his suggestion.

Early on the 17th the Prussians drew off northwards on three roads, Thieleemann covering the withdrawal and moving via Gembloot to join hands with Billow. The French cavalry on the right, hearing troops in motion on the Namur road, dashed in pursuit down the turnpike road shortly after dawn, caught up the fugitives and captured them. They turned out to be stragglers; but their capture for a time helped to confirm the idea, prevalent in the French army, that Blücher was drawing off towards his far right, and Napoleon's deliberation was finally to be brought to a close by an unworthy suggestion of his own. The situation was still obscure, details as to what had happened on the French left were wanting, and the direction of Blücher's retreat was by no means certain. Orders, however, were sent to Ney, about 8 A.M., to take up his position at Quatre Bras, and if that was impossible he was to report at once and the emperor would co-operate. Napoleon clearly meant that Ney should attack whatever happened to be in his front. If confronted by a rear-guard he would drive it off and occupy Quatre Bras; and if Wellington was still there the marshal would promptly engage and hold fast to the best of his powers. Napoleon's last hope was that Blücher would in this case hasten up with the reserve and crush Wellington. Wellington in fact was there; but Ney did nothing whatever to retain him, and the duke began his withdrawal to Mt. S. Jean about 10 A.M. The last chance of bringing about a decisive French success was thus allowed to slip away.

Meanwhile Napoleon paid a personal visit about 10 A.M. to the Ligny battlefield, and about 11 A.M. he came to a decision. He determined to send the two cavalry corps of Pajol and Grouchy (troops of operations), and Exelmans, and the corps of Vandamme and Gérard, with Tacte's division (VII Corps), a force of 33,000 men and 110 guns, to follow the Prussians, penetrates their intentions and discover if they meditated uniting with Wellington in front of Brussels. As Exelmans' dragoons had already gained touch of the III. Prussian corps at Gembloot, the emperor directed Marshal Grouchy, to whom he handed over the command of this force, to "proceed to Gembloot." This order the marshal only too literally obeyed. After an inconceivably slow and wearisome march, in one badly arranged column moving on one road, he only reached Gembloot on June 17, and halted there until the night. Wellington effected so many roads. The Austrian's corps, which was resting at Gembloot, but the enemy was allowed to slip away and contact was lost for want of a serious effort to keep it. Grouchy did not proceed to the front, and entirely failed to appreciate the situation at this critical juncture. Pressing danger could only exist if Blücher had gone northwards, and northwards, therefore, in the Dyle valley, he should have diligently sought for traces of the Prussian retreat.1 Had Blücher gone eastwards, Grouchy, holding the Dyle, could easily have held back any future Prussian advance towards Wellington. Grouchy, however, went to Gembloot as ordered. By nightfall the situation was all in favour of the allies; for Grouchy was now actually outside the four Prussian corps, who were by this time concentrated astride the Dyle at Wavre. Their retreat having been unmolested, the Prussians were ready once more to take the field, quite twenty-four hours before Napoleon deemed it possible for the foe defeated at Ligny.

On the other flank, too, things had gone all in favour of Wellington. Although the emperor wrote to Ney again at noon, from Ligny, that troops had now been placed in position at Marbaix to second the marshal's attack on Quatre Bras, Ney replied that Wellington affected so grand and skilful a retreat that, on Napoleon's arrival at the head of his supporting corps, 1 There appears to be no reason to believe that Grouchy pushed any reconnaissances to the northward and westward of Gentimes on June 17; had he done so, touch with Blücher's retiring columns must have been established, and the direction of the Prussian retreat made clear. The right of Milhaud's cavalry corps, whilst marching from Marbaix to Quatre Bras, saw a column of Prussian infantry retiring towards Wavre, and Milhaud reported this fact about 9 P.M. to the emperor, who, however, attached little weight to it.
he found only the duke's cavalry screen and some horse artillery still in position. Can we wonder that he gave vent to his anger Napoleon's and declared that Ney had ruined France? This was the fatal mistake of the campaign, and Fortune turned now against her former favourite. Although the enflamed fires of his old energy blazed out once more and Napoleon began a rapid pursuit of the cavalry screen, which crumpled up and decamped as he advanced, yet all his efforts were powerless to entangle the Anglo-Dutch rearguard to such an extent that Wellington must turn back to its assistance. The pursuit, too, was carried out in the midst of a tropical thunderstorm which broke at the roar of the opening cannonade, and very considerably retarded the French pursuit. It was not until the light was failing that Napoleon reached the heights of Rossumme opposite to Wellington's position and, by a masterly reconnaissance in force, compelled the duke to disclose the presence of practically the whole Anglo-Dutch army. The French halted, somewhat loosened by pursuit, between Rossumme and Genappe and spent a wretched night in the sodden fields.

During the night Wellington received the reassuring news that Blücher would bring two corps certainly, and possibly four, to Waterloo, and determined to accept battle. Napoleon's plan being to penetrate between the allies and then defeat them successively, the left was really the threatened flank of the Anglo-Dutch army. Yet so far was Wellington from divining Napoleon's object that he stationed 17,000 men including Colville's British garrison at Genappe and left the right to his right, to repel the turning movement that he groundlessly anticipated and to form a rallying point for his right in case his centre was broken. By deliberately depriving himself of this detachment, on June 18, the duke ran a very grave risk. With the 67,600 men whom he had in hand, however, he took up a truly admirable "Wellingtonian" position astride the Nivelles-Brussels and Charleroi-Brussels roads which met at June 18. Mt S. Jean. He used a low ridge to screen his main defensive position, exposing comparatively few troops in front of the crest. Of his 156 guns, 78 belonged to the British artillery; but of his 67,600 men only 29,800 were British or King's German Legion troops, whereas all Napoleon's were Frenchmen and veterans. Wellington occupied Hougomont in strength, chiefly with detachments of the British Guards; and he also placed a garrison of the K.G.L. in La Haye Sainte, the tactical key of the allied position. Both these farms were strengthened; but, still nervous about his right flank, the duke occupied Hougomont in much greater force than La Haye Sainte, and massed the bulk of his troops on his right. The main position was very skilfully taken up, and care was taken to distribute the troops so that his men from hand to hand were closely supported by those who were "better disciplined and more accustomed to war." Owing to a misconception, one Dutch-Belgian brigade formed up in front of the ridge. Full arrangements were made for Blücher's co-operation through General Mülling, the Prussian attaché on the duke's staff. The duke was to stand fast to receive the attack, whilst the Russians should close round Napoleon's exposed right and support Wellington's left. The Prussians were thus the real general reserve, and it was Wellington's task to receive Napoleon's attack and prepare for the decisive battle. After Blücher's departure, Blücher loyally kept his promise to his ally; but the execution left much to be desired. He did not start his corps on their westward march until a considerable time after dawn, and then, owing to bad staff work, the rear corps of all (Blücher) was selected to lead the march. This unnecessary delay was aggravated further by a fire that broke out in Wavre and delayed the march. In spite of his hurts the old marshal was in the saddle.

Meanwhile Napoleon formed his army for the attack on Wellington's position. The wet state of the ground (largely composed of corn-fields) and the scattered bivouacs of the French army made it difficult for the attack to be accomplished as Napoleon had desired. It was therefore put off first of all until 9 A.M., and later until 11.30, to permit the sodden ground to dry sufficiently for the mounted arms to manoeuvre freely and give time to the French army to close up. During the night the emperor had received a report from Marshal Grouchy, dated Gembloix, 10 P.M., 17th, which stated that the Prussians were retiring in two columns towards Wavre and Perwez. Grouchy added that if he found that the bulk of the Prussians were moving on Wavre that would follow them and separate them from Wellington. But a glance at the map shows that this was impossible. By following the Prussians Grouchy, who had taken up a position outside the Prussian left flank, would inevitably drive the allies together. It was 10 A.M. when the emperor answered this letter, and he directed the marshal to march for Wavre, thus approaching the French army and entering the zone of the main operations. The underlying idea of maneuvering in two wings and a reserve should be kept in mind when considering this letter. Its meaning will then clearly be, that Grouchy was to endeavour to place his force on the inner Prussian flank and hold them back from Waterloo. But this is just what the despatch does not state veritably and precisely, and accordingly Grouchy, like Ney on the 16th and 17th, missed it.

The French army proceeded to form up in an imposing array some 1,200 yards from Wellington's position, and if some misgivings as to the result filled the minds of men like Soult, Reille and Foy, who had had previous experience of Wellington in the field, none at any rate dwelt in Napoleon's mind. The lateness of the hour at which the attack was delivered, and the emperor's determination to break Wellington's centre instead of moving on Wavre, as Grouchy thought he had reason to suppose, deprived him of whatever chance be still possessed of beating Wellington before Blücher could intervene. Napoleon drew up his army of 74,000 men and 246 guns in three lines, fully in view of the allies. In the first line were the corps of Reille and D'Erlon, who were destined to attack the allied line and prepare it for the final assault. In the second line were Kellermann's cuirassiers, the incomplete corps of Lobau, the squadrons of Donon and Subervie, and Milhaud's cuirassiers. In the third line was the Guard. It was an imposing array of veteran troops, and when their emperor rode along the lines they received him with extraordinary enthusiasm. The battle of Waterloo may be divided into five phases.

**Waterloo: the first phase.**

About 11.30 the first phase opened with an attack by one of Reille's divisions on Hougomont. This was a mere side-issue, destined to draw Wellington's attention away from his right, and in this it failed. About noon, however, a battery of 80 French guns unlimbered on the long spur to the S.E. of La Haye Sainte, to prepare the duke's centre for the main attack. Here the form of the ground so skilfully chosen sheltered the defence in some degree from the heavy fire that now beat against the position. After 1 P.M., and just before he gave orders for Ney to lead the main attack, the emperor scanned the battlefield, and on his right front he saw a dense dark cloud emerging from the woods at Chapelle Saint Lambert. It was soon discovered that this was Bülow's corps marching to Wellington's assistance. A letter was now awaiting despatch to Grouchy, and to it was added a postscript that the battle was raging with Wellington, that Bülow's corps had been sighted by the emperor, and that the marshal was to hasten to the field and crush Bülow. This order at least was precise and clear, but it was sent 12 hours too late, and when Grouchy received it he was unable to carry it out. To neutralize Bülow when necessity arose, the emperor now detached Lobau together with the squadrons of Donon and Subervie. The French general, however, hardly drew out far enough from the French right; otherwise the magnificent resolution he displayed and the admirable obstinacy with which his troops fought against ever-increasing odds are worthy of all praise. Thus as early as 1.30 P.M. the Prussian intervention began to devastate the symmetry of Napoleon's battle-array. It did not occur to Wellington that this was a sudden sortie to break off his own position and seek a more favourable opportunity of beating the allies in detail. He was still determined to play the game out to the bitter end, and involve Wellington and Bülow's corps in a common ruin.
Ney was therefore ordered to attack Wellington’s centre with D’Erlon’s corps. Owing to a misconception the columns used for advance were over-heavy and unwieldy, and the corps failed to achieve anything of importance. As D’Erlon’s troops advanced the Dutch-Belgian brigade in front of the ridge, which had been subjected to an overwhelming fire from the 80 French guns at close range, turned about and retired in disorder through the main position. This, however, was the solitary success secured by the I. corps; for the left division failed to storm La Haye Sainte, which was most gallantly defended, and Picton’s division met the remainder of D’Erlon’s corps face to face, engaging them in a murderous infantry duel in which Picton fell. It was during this struggle that Lord Uxbridge launched two of his cavalry brigades on the enemy; and the “Union brigade” catching the French infantry unawares rode over them, broke them up, and drove them to the bottom of the slope with the loss of two eagles. The charge, however, over-reached itself, and the British cavalry, crushed by fresh French horsemen hurled on them by the emperor, were driven back with great loss. So far no success against Wellington had been achieved, and Bülüow was still an onlooker.

Ney was now ordered to attack La Haye Sainte again, but the attack failed. A furious cannonade raged, and the Anglo-Dutch line withdrew slightly to gain more cover from the ridge. Ney misinterpreted this manoeuvre and led out, about 4 p.m., Milhaud’s and Lefebvre-Dessouet’s horsemen (43 squadrons) to charge the allied centre between the two farms. For several reasons, the cavalry could only advance at a trot. As the horsemen closed they were received with volleys of case from the guns, and the infantry formed into squares. Against the squares the horsemen were powerless, and failing to break a single square, they were finally swept off the plateau by fresh allied horsemen. Kellermann’s cuirassiers and the heavy horse of the Guard (37 fresh squadrons) now advanced to support the baffled cavalry, the latter falling in support. The whole 80 squadrons resumed the attack, but with no better result. The cavalry gradually became hopelessly entangled among the squares they were unable to break, and at last they were driven down the face of the ridge and the most dramatic part of the battle came to an end. Had these great cavalry attacks been closely supported by infantry, there can be little doubt that they must have achieved their object. But they were not. In his handling of the three arms together, Napoleon on this day failed to do justice to his reputation.

About 4.30 p.m. Bülüow at last engaged. Lobau’s men were gradually overpowered and forced back into Plancenoit, the village was stormed, and the Prussian round shot reached the main road. To set his right flank free the emperor called further on his reserve, and sent Duquesne with the Young Guard to Lobau’s support. Together, these troops drove Bülüow out of Plancenoit, and forced him back towards the Paris wood. But the Prussians had not yet changed the fate of the day.

Napoleon now ordered Ney to carry La Haye Sainte at whatever cost, and this the marshal accomplished with the wrecks of D’Erlon’s corps soon after 6 p.m. The garrison (King’s German Legion) had run out of rifle ammunition and the French bursting in seized the post. This was the first decided advantage that Napoleon had gained during
the day. The key of the duke's position was now in Napoleon's hands, Wellington's centre was dangerously shaken, the troops were exhausted, and the reserves inadequate. But the Iron Duke faced the situation unmoved. Calmly he readjusted his line and strengthened the torn centre. Happily for him, Pirch I's and Zieten's corps were now at hand. Pirch I. moved to support Billow; together they regained possession of Plancenoit, and once more the Charleroi road was swept by Prussian round shot. Napoleon, therefore, had to free his right flank before he could make use of Ney's capture. To this end he sent two battalions of the Old Guard to storm Plancenoit. The veterans did the work magnificently with the bayonet, ousted the Prussians from the place, and drove them back 600 yards beyond it. But Napoleon could not turn now on Wellington. Zieten was fast coming up on the duke's left, and the crisis was past. Zieten's advance permitted the two fresh cavalry brigades of Vivian and Vandeleur on the duke's extreme left to be moved and posted behind the depleted centre. The value of this reinforcement at this particular moment can hardly be overestimated.

The French army now fiercely attacked Wellington all along the line; and the culminating point of this phase was reached when Napoleon sent forward the Guard, less 5 battalions, to attack Wellington's centre. Delivered in three échelons, these final attacks were repulsed, the first by a Dutch line; a Dutch-Dutch division; the second and third échelons by the Guards, the 52nd, and the Royal Artillery. Thus ended the fifth phase.

As the Guard recoiled (about 8 P.M.) Zieten pierced the northeast corner of the French front, and their whole line gave way as the allies rushed forward on their now defenceless prey. Three battalions of the Guard indeed stood their ground for some time, but they were finally overwhelmed. Afterwards, amidst the ruins of their army, two battalions of officers simply defied all efforts to break them. But, with the exception of these two battalions, the French army was quickly transformed into a flying rabble. Bilow and Pirch I. now finally overpowered Lobau, once more recaptured Plancenoit, and sealed the doom of the French army. But Lobau's heroic efforts had not been in vain; they had given him master's time to make his last effort against Wellington; and when the Guard was beaten back the French troops holding Plancenoit kept free the Charleroi road, and prevented the Prussians from seizing Napoleon's line of retreat.

When Wellington learned of Lobau's defeat at 9.15 P.M. at "La Belle Alliance," the victorious French arranged that the Prussians should take up the pursuit, and they faithfully carried out the agreement. Pushing on through the night, they drove the French out of seven successive bivouacs and at length drove them over the Sambre. The campaign was virtually at an end, and the price paid was great. The French had lost over 40,000 men and almost all their artillery on June 18; the Prussians lost 7,000, and Wellington over 15,000 men. So desperate was the fighting that some 43,000 killed and wounded lay on an area of roughly 3 sq. m. At one point on the plateau the 27th (Infantry) were lying literally dead in square, and the position that the British infantry held was plainly marked by the red line of dead and wounded they left behind them.

A few words may now be bestowed on Marshal Grouchy, commanding the right wing. The marshal wrongly determined on the 18th to continue his march to Wavre in a single column, and he determined, still more wrongly, to continue it move by the right bank of the Dyle. Breaking up from bivouac long after dawn, he marched forward, via Walloons. Here he stopped to fort to the emperor some intelligence which turned out to be false, and he remained for breakfast. Hardly had he finished when the opening roar of the cannonade at Waterloo was heard. Grouchy was now urged by his generals, especially by Gérard, to march to the sound of the firing, but he refused to take their advice, and pushed on to Wavre, where he found the Prussians (Thielemann's corps of 16,000 men) holding the passages across the Dyle. A fierce fight (called the Action of Wavre) began about 4 P.M., in which the Prussians were for long victorious. Instead of concentrating his force upon one bridge over the swampy and unfordable Dyle, Grouchy scattered it in attacks upon several; and when the emperor's desperate army, saying Bilow was. Napoleon the marshal was powerless to move westward. Towards the end of the day Colonel Vallin's Hussars stormed the Limal bridge, and a large part of Grouchy's force then promptly gained the left bank. The action continued till about 11 P.M., when it died out, to recommence shortly after dawn. Thielemann was at length overborne by sheer weight of numbers, and towards 1 A.M. he was forced to retire towards Louvain. The losses were considerable, about 2,400 men on each side.

Grouchy's victory was barren. In the far higher duty of cooperation he had failed miserably. His tactical achievement could avail the emperor nothing, and it exposed his own force to considerable danger. Whilst pondering on the course he should follow, the marshal received the news of the awful disaster that had overtaken the emperor at Waterloo. In a flash he realized his danger and made prompt arrangements to begin his retreat on Namur, the only line to France that was then available. This retreat he carried out resolutely, skillfully and rapidly, slipping past Bilow and finally bringing his force to Paris. But the rapid advance of the allies gave France no time to rally. Napoleon was forced to make his preparations to escape, and Napoleon's escape was sailable (on July 14) to the British, "the most powerful, the most unwavering and the most generous of his foes."

The causes of Napoleon's failure in the Waterloo campaign were as follows:—The French army was numerically too weak for the gigantic task it undertook. Napoleon himself was no longer the Napoleon of Marengo or Austerlitz, and though he was not broken down, his physical strength was certainly impaired. Ney failed to grasp and hold Wellington on the critical 17th June; and on the 17th and 18th Grouchy's feeble and false manoeuvres enabled Bliicher to reach and join Wellington at Waterloo. Napoleon's chance of success was dangerously diminished, if not utterly destroyed, by the incompetence of the two marshals whom in an evil hour he selected for high commands. Another dominant influence in shaping the course of events was the loyalty of Bilow to his ally, and the consequent appearance of the Prussian army at Waterloo. Nor must we overlook Wellington's unwavering determination to cooperate with Bilow at all costs, and his firmness on June 18; or the invincible steadiness shown by the British troops and those of the King's German Legion.

BIBLIOGRAPHY.—Some of the principal books on the campaign are: Colonial Despatches and Paper, 1815; Colbrand, Le Journal de la Prusse; Colonial Despatches and Paper, 1815; N. H. H. N. P., Thielemann's Gallows, Waterloo (1851); Shaw-Kennedy, Battle of Waterloo; Captain W. Sihore, 9th Foot, History of the Waterloo Campaign; Clausewitz, Campagne de 1815; Colonel Charras, Histoire de la Campagne de 1815; Waterloo: Diaries, Dispatches and Memoirs of the Battle of Waterloo; Correspondence and Commentaires de Napoléon. In this article the writer has been greatly assisted by the advice and suggestions of Lieut.-Col. H. W. L. Hine, R.A. (A. B. F.)
WATER MOTORS. The subject of hydraulic transmission of power is treated generally under Power Transmission (Hydraulic), and the present article is confined to water motors.

Hydraulic Lifts.—The direct-acting lift is perhaps the simplest of all machines using pressure-water, but as the height of the lift increases, certain problems increase in difficulty, and become exceedingly difficult to cope with, notably those due to the great increase in the weight and displacement of the ram. In fact, with a simple ram it is not possible to lift beyond a certain height with a given pressure and load. It becomes, therefore, necessary to balance in some way the varying displacement of the ram if economy is to be secured in working: this is often done by the use of counter-weights attached to chains travelling over head sheaves, but this largely destroys the simplicity and safety of the direct-acting lift, and hence some form of hydraulic balancing is more satisfactory and more certain.

In one form, shown in fig. 1, the lift cylinder is in hydraulic connexion with a pair of short cylinders placed one above the other, the plungers working in them being connected together by a common rod. Below the piston of the upper cylinder is an annular space C (subsequently the annular space in the piston rod) with a capacity equal to the maximum displacement of the lift-ram, while the corresponding annular area C of the piston of the lower cylinder is just large enough when subjected to the working water pressure to enable the work of lifting the net load to be done and any friction to be overcome. The area B of the top side of the upper piston is proportioned in such a way that when under the full water pressure the dead weight of the ram and cage is just balanced when the former is at the bottom of its stroke. With this arrangement the lift-ram and the two balance plungers are always in equilibrium, or, in other words, the ever-changing displacement of the lift-ram is automatically in balance.

To work the lift, pressure-water is admitted to the annular space C above the lower of the two balance plungers (the space B above the upper one is always in communication with the pressure-water), and the combined pressure on the two plungers is sufficient to lift the cage, ram and load. As the ram ascends it apparently increases in weight, but this is balanced by the increased pressure on the two balance plungers as they descend, owing to the increase of the head of water acting on them. To allow the lift-ram to descend, the pressure-water in C above the lower balance piston is discharged through the exhaust into the drain, while that above the upper piston is simply pushed back into the pressure main. As an illustration of the operation of this system, it may be mentioned that in one lift having a 6-in. ram with a lift of 90 ft., the working load being 1 ton and the maximum working speed 180 ft. a minute, the quantity of pressure-water used per journey of the lift is reduced from 200 to 24 gallons by the use of this method of balancing.

In another system of hydraulic balance (fig. 2) the ram A has an annular area so proportioned that when it is connected with the water in an elevated tank (usually placed somewhere in the roof of the building), the hydraulic pressure upon it just balances the weight of the ram and cage. Here again, since the intensify of the pressure increases as the ram descends, the apparent increase of weight of the lift-ram as it rises is automatically balanced; water from the high-pressure system is admitted down the hollow ram B and does the work of lifting the live load. Since the introduction of deep-level electric railways in London and elsewhere, hydraulic passenger lifts on a large scale have been introduced to use for carrying passengers up and down from the street level to the underground stations.

Direct-acting Water Motors.—Owing to the difficulty of securing a durable motor with a simple and trustworthy means of automatically regulating the quantity of water used to the power needed at various times from the motor, not much advance has been recently made in the use of water motors with reciprocating rams or pistons. Probably the most successful one has been a rotary engine invented by Mr Arthur Rigg.

In this engine the stroke, and therefore the amount of water used, can be varied either by hand or by a governor, and the speed can also be varied, very high rates, as much as 600 revolutions a minute, being attainable without the question of shock or vibration becoming troublesome. The cylinders are cast in one piece with a circular valve, and rotate about a main stud S (fig. 3), while their plungers are connected to a disk crank which rotates above the point O, which is the centre of the main crank; O S being the crank length or half stroke of the engine, any variation in its length will vary the engine, and at the same time the quantity of water used. The movement of S is obtained by means of a relay engine, in which there are two rams of different diameters; a constant pressure is always acting on the smaller of these when the motor is at work, while the governor (or hand-ram), rotating its own water wheel from the face of the other, and the movements to and fro thus given to the two rams alter the position of the stud S, and thus change the stroke of the plungers of the main engine. Fig. 4 gives an outside view of a 30-H.P. engine capable of using water at a pressure of 700 lb per sq. in., the governor of the driving pulley shown at the right-hand end, while the working revolving cylinders are carried inside the boxed-in flywheel at the left-hand end, the relay cylinder and its attachments being fixed to the bed-plate in front of the flywheel. On a test one of these engines gave an efficiency or duty of 80%.

WATER WHEELS.—The Pelton water wheel (fig. 5) has proved a most successful motor when very high heads are available, heads of 2000 feet having been used occasionally. Such machines have been extensively employed in America, and have also lately been used in Great Britain, worked by the high-pressure water supplied in large towns.

The wheel carries a series of cups placed at equal distances around the circumference. A jet or jets of water impinge on the cups, the interiors of which are shaped in such a way that the jet is discharged parallel to its original direction. If the linear velocity of the cups in feet a second is V, and the linear velocity of the jet is V, then the velocity of the jet relative to the cup is V-V, and the velocity of the water is to be given up to the cups, the water must leave the cup with zero absolute velocity. But its velocity relative to the cup, as it passes backwards, is -(V-V), and hence the relative velocity of the cup is V-V. This will be zero when V-V, that is, if the linear velocity of the cups is one-half of the velocity of water impinging upon them. The theoretical efficiency of the wheel would then be 100%. The actual efficiency of the wheels when used with high falls is from 80 to 85%.

1 This engine was fully described in Engineering, vol. xiv, p. 61.
of 70% has been obtained, and when a dynamo is driven directly by them about 66% of the hydraulic energy has been converted into electric energy.

Pelton wheels are very sensitive to variation of load, and considerable trouble was experienced at first in securing adequate
governing when they were used to generate electric energy; but this difficulty has been overcome, and they have been rendered most efficient machines for use with high falls, where ordinary turbines would be difficult to manage owing to the excessive speed at which they would run. In a small installation in the United States water is brought in a 36-in. pipe a distance of 1800 ft., and supplies six Pelton wheels each 28 in. in diameter, running at 135 revolutions a minute under a head of 130 ft. The total power developed is 600 H.P., and though the load factor varies very greatly in this case, the differential type of governor used secures perfect control of the running of the wheels.

Turbines.—The turbine has now become one of the most efficient of the prime movers employed by man, and in the United States of America and on the continent of Europe its use has enormously increased of recent years. Though no radical changes have been made in the design of turbines for some years, an immense amount of skill and ingenuity has been shown in perfecting and improving details, and such machines of great size and power are now constantly being made, and give every satisfaction when in use.

In the "Heracles" turbine, shown in fig. 6, the flow is what is called mixed, that is, it is partly a radial inward and partly an axial flow machine. On entering, the water flows at first in a radial direction, and then gradually, as it passes through the wheel, it receives a downward component which becomes more and more important. Professor Thurston has published the results of a test

1 This and some of the other drawings have been taken from Blaine's Hydraulic Machinery.
2 The following statistics of turbine construction in Switzerland are taken from Schweizerische Bauzeitung (1901), p. 128, which, in the same volume at p. 53, contains a valuable article on the most important improvements in turbines and their regulation shown in the Paris Exhibition of 1901:

efficiency of the Francis turbine being in this case 86% at full load and 77% at half load.

A recent form of the Jonval turbine is shown in fig. 7. This turbine was designed to give 1250 H.P. with a fall of 25 ft. and an efficiency of 77%. It is fitted with a suction pipe of a circular balanced sluice for admitting and cutting off the water-supply. The wheel is 12 ft. 3 in. in diameter, and has a speed of fifty revolutions per minute, and the power generated is transmitted through bevel-gearing to a horizontal shaft from which the power is taken.

FIG. 7.—Jonval Turbine.

off for various purposes. When complete the turbine weighed about 140 tons. There is a regulating arrangement, by which one half of the guide-passages can be shut off, and with low heads from the water, and at the same time air is freely admitted into these unused passages by pipes which pass through the hinges of the controlling shutter. Tests of a turbine of this slow-moving type showed an efficiency of 82% at full gate, and one of 75% when half of the guide-blades were closed by the shutters, as described above.

As an illustration of the use of water-power, even at a considerable distance from a town, the case of Lausanne may be described. The town has secured the right of using a waterfall of 113 to 118 ft. high, by impounding the Rhône near Saint Maurice. In dry seasons this will supply 6000 H.P., and for quite ten months in an ordinary year 14,000 H.P. The plant in 1902 consisted of five turbines, having horizontal axles, and each developing 1000 H.P. when running at 300 revolutions a minute. They drive electric generators, and the current so produced is taken at a pressure of 22,000 volts on overhead wires a distance of 35 m. to Lausanne, the loss being estimated not to exceed 10% in the long transmission. Near the town is a station for reducing the voltage, and current is distributed at 125 volts for lighting purposes and at 500 volts for use on the tramways and for other power purposes.

WATER-OPPUSUM, or YAPOCK (Chironectes minimus), the single representative of the genus. This animal is distinguished from other opossums by its webbed hind-feet, non-tuberculated soles, and peculiar coloration. Its ground colour is light grey, with four or five sharply contrasted brown bands passing across its head and back, giving it a very peculiar motied appearance; the head and body together are about 14 in. long, and the tail measures a little more. It is almost wholly aquatic in its habits, living on small fish, crustaceans and other water animals; its range extends from Guatemala to southern Brazil.

WATER POLO, a game which has done much to advance swimming in popular favour and to improve the stamina of swimmers. It is played either in a bath or open water, the teams consisting of seven a side. The field of play must not exceed 30 yds. or be less than 10 yds. in length, and the width must not be more than 20 yds. The ball used must be round and fully inflated, and must not measure less than 26½, nor more than 28 in. in circumference. It must be waterproof, with no strapped seams outside, and no greasy or other objectionable substance placed on it. The goals must be 10 ft. in width, with a post 3 ft. above the surface when the water is 5 ft. or over in depth, and 8 ft. from the bottom when the water is less than 5 ft. in depth; in no case must the water in which a game is played be less than 3 ft. Goal nets are used in all important matches.

The duration of a match is supposed to be 14 minutes, seven minutes each way. The officials consist of a referee, a time-keeper and two goal scorers, the first-named official starting the game by throwing the ball into the centre of the bath. A goal is scored by the entire ball passing between the goal posts and under the crossbar.

The players have to place themselves in a line with their respective goals, and are not allowed to start swimming to the centre of the bath until the word "Go" is given. They are usually divided into 3 goals, 1 half-back, a goal-keeper, and 2 half-forwards. Each swimmer is usually assigned the place of centre-forward, and it is his duty to make all headway possible so as to reach the ball before the opposing forward of the other side, then pass rapidly back to the half or one of the backs and swim on to within close range of the opponent's goal and wait for a pass. The other forwards should rapidly follow him up and each man carefully shadow one of the goal-keepers, the ball only being allowed in to touch the ball with both hands at the same time constitutes a foul, as also does the holding of the rail or the side, during any part of the game, the standing on or touching of the bottom of the bath or the playing of the ball in any other accidental way, for touching the ball with both hands at the same time constitutes an opponent in any way, unless he be holding the ball, holding the ball under water when tackled, jumping from the bottom or pushing off from the side (except at starting or reporting) in order to play the ball or duck an opponent, holding, pushing back or pushing off from an opponent, turning on the back to kick at an opponent, assisting a player at the start or restart to get a goal push off, throwing the ball at the goakeeper from a free throw or refusing to play the ball at the command of the referee after a foul or the ball has been out of the field of play. Dribbling or striking the ball is held to be not holding, but lifting, carrying, pressing under water or placing the hand or leg over the ball or any other accidental way, as if to dribble up the bath and through the posts is permissible. There is a penalty area, 4 yds. from each goal-post, and the imaginary line across the bath is not allowed to be crossed. All Fouls are to be given as free throws, the player committing the foul to be awarded a free throw from the ball being blown for a free throw or other similar stoppage of play, or deliberately splashing an opponent in the face, are all held to be foul fouls. Whenever the whistle blows for fouls the players have to leave the water and the ball cannot be played until the player to whom the free throw was awarded. A player who has been deliberately fouled within 4 yds. of his opponent's goal line is given a penalty throw, and the consequence is that a match is broken when his goal is hoisted assaulted. In the ordinary fouls the ball must touch another player before a goal can be scored, but in penalty throw no such restriction applies. The match is divided into 2 periods of 7 minutes, during which they leave the water. Fouls, half-time and time are decided by whistle, and goals by bell.

The game requires careful practice of smart and scientific passing, side passing, back-handed through, sliding and head, and intuitive shooting. For this purpose "throwing the water-polo ball" contests are commonly held by the leading clubs, who also enter competitions on points for shooting at goal.
WATER RIGHTS

imposed upon, riparian proprietors, in addition to those falling under the head of fishery or navigation. In these matters English law is in substantial accordance with the law of other countries, most of the rules being deduced from Roman law. Perhaps the main difference is that running water is in Roman law a res communis, like the air and the sea. In England, owing to the greater value of river water for manufacturing and other purposes, it cannot be said to be common property, even though it may be used for navigation. The effect of this difference is that certain rights, public in Roman law, such as mooring and unloading cargo, bathing, drying nets, fishing for oysters, digging for sand, towing, &c., are only acquirable by prescription or custom in England. By Roman law, a but might lawfully be built on the shore of the sea or of a tidal river; in England the right to build a building on the foreshore is not legal unless by custom or prescription (Llandudno Urban Council v. Woods, 1899, 2 Ch. 705). Nor may a fisherman who dredges for oysters appropriate a part of the foreshore for storing them (Truro Corporation v. Rowe, 1902, 2 K.B. 709).

The right of use of the water of a natural stream cannot be better described than in the words of Lord Kingsdown in 1858: "By the general law applicable to running streams, every riparian proprietor has the right to draw off the water and to use it for all purposes of his land— for instance, to the reasonable use of the water for domestic purposes and for his cattle, and this without regard to the effect which such use may have in case of a deficiency upon proprietors downstream by the unreasonable use of it for any purpose, or what may be deemed the extraordinary use of it; provided he does not thereby interfere with the rights of others, either in the enjoyment of their respective rights, or in the junction of the streams. He must, in addition, may dam up a stream for the purposes of a mill, or divert the water for the purpose of irrigation. But he has no right to intercept the regular flow of the stream, if he thereby interferes with the lawful use of other proprietors. Beside the common right to use the water, such a proprietor does not arise at common law, as in the case of a natural stream, but must be established by grant or prescription. If its origin be unknown the inference appears to be that riparian proprietors have the same rights as if the stream had been a natural one (Basil v. Clark, 1902, 1 Ch. 639). The rights of a person not a riparian proprietor who uses land abutting on a river or stream by the right of the riparian proprietor, compensating the proprietor, he was a riparian proprietor, for he cannot be imposed as a riparian proprietor upon the other proprietors without their consent. The effect of this appears to be that he is not entitled to sensibly affect navigation or change the current of the river. It is to be noted that the riparian proprietor does not arises at common law, as in the case of a natural stream, but must be established by grant or prescription. If its origin be unknown the inference appears to be that riparian

See also Moore's Handybook for rules of the game and instructions for referees.

(W. Hy.)

WATER RIGHTS. By the law of England the property in the bed and water of a tidal river, as high as the tide ebbs and flows at a medium spring tide, is presumed to be in the crown, or as a franchise in the name of the crown, as the case may be, of a municipal authority or of a district council, and to be extra-parochial. The bed and water of a non-tidal river are presumed to belong to the person through whose land it flows, or, if it divide two properties, to the riparian proprietors, the rights of each extending to midstream (ad medium flum aquae). In order to give riparian rights, the river must flow in a defined channel, or at least above ground. The diminution of underground water collected by percolation, even though malicious, does not give a cause of action to the owner of the land in which it collects, it being merely damnum sine injuria, though he is entitled to have it pumped out unless a right of pollution be gained against him by prescription. The right to draw water from a-nother's well is an easement, not a profit à prendre, and is therefore acquirable by custom. As a general rule a riparian proprietor, whether on a tidal or a non-tidal river, has full rights of user of his property. Most of the statute law will be found in the Sea Fisheries Acts 1843 to 1891, and the Salmon and Freshwater Fisheries Acts 1861 to 1886. In certain cases the rights of the riparian proprietors are subject to the intervening rights of other persons. These rights vary according as the river is navigable or not, or tidal or not. For instance, all the riparian proprietors might combine to divert a navigable river, though one alone could not do so as against the others, but no combination of riparian proprietors could defeat the right of the public to have a navigable river maintained undiverted. We shall here consider shortly the rights enjoyed by, and the limitations

XXVIII. 13
WATER-SCORPION—WATERSPOUT

Pollution Act), to water cattle, &c. In some cases the validity of local riparian customs has been recognized by the legislature. The right of the riparian against encroachment and the duty of the riparian against navigation and landing-harbour rights, -the use of the river by canoes, -the use of the river by fish, and the right of passage for and over the land of riparian proprietors -was confirmed to the fishermen of Somerset, Devon and Cornwall by 1 Jac. I. c. 23. Digging sand on the shore of tidal waters for use as manure or for other purposes, was prohibited by the Mining Act, 7 Jac. I. c. 18. The public right of taking or killing rabbits in the daytime on any sea bank or river bank in the county of Lincoln, so far as it may be connected with the fishing of the same, was protected by the Larceny Act 1881. It should be noticed that rights of the public may be subject to private rights. Where the river is navigable, although the right of navigation is common to the subjects of the state, it may be prevented or restricted by contract unless the water be by act of parliament. In Hopkins v. G. N. Ry. Co., 1877, 2 Q.B.D. 224 (followed in Dibden v. Skirrow, 1907, 1 Ch. 437), it was held that the owner of a ferry cannot maintain an action for loss of traffic even though no use is made of the ferry, and that no provision for new traffic. Many ferries are now regulated by local acts.

Waters - the gorges of Domesday, the bedilus of Magna Carta, as a right to a fishery, is a nuisance. A riparian law unless granted by the crown before 1272. From the etymology of kildellus the weir was probably at first of wicker, later of timber or stone. The owner of a several fishery in tidal waters cannot maintain his claim to a weir unless the same be by act of parliament. L. C. v. Magna Carta 1875, 5 A.C. 646. The right of fishing for pilchards was granted to the town of Newlyn by the Larceny Act 1881. In such cases only sea-bathing, but Hall (p. 160) is of opinion that a right to bathe in private waters may exist by prescription or custom. There is no common-law right to bathe in the sea or to place bathing-machines on the shore. Prescription or custom is necessary to support a claim, whether the foreshore is the property of the crown or of a private owner (Brinckman v. Malley, 1904, 2 Ch. 313). Bathing in the sea or in rivers is now often regulated by the by-laws of local authority.

Scotland—The Law of Scotland is in general accordance with that of England. One of the principal differences is that in Scotland, if a charter state that the sea is the boundary of a grant, the foreshore is included in the grant, subject to the burden of crown rights for public purposes. Persons engaged in the herring fishery off the coast of Scotland have, by 11 Geo. III. c. 31, the right to use the shore for 100 yds. from high-water mark for landing and drying fish. The Royal Marines during the French war were quartered on the Mississauga under orders of the Government and had the right to use the shore for that purpose. The right of ferry is one of the regalia minora acquirable by possession on a charter of barony. Sea-gulls are private property. The right to take seaweed from another's foreshore may be prescribed as a servitude. Interference with the free passage of salmon by abstraction of water to artificial channels is restraints by Interdict (Philipson v. Defoe, 1866, 47 C.B. 478). See the Salmon Fisheries (Scotland) Acts 1828 to 1868.

In Ireland the law is in general accordance with that of England. In 12 Hen. VIII. c. 5, R. 4 L. 6, the Irish court went perhaps beyond any English practice in the case of the holding of land in the water. Leaves from the foreshore are not larceny. The Rivers Pollution Act 1876 was re-enacted for Ireland by the similar act of 1893.

Waterspout—Waterspout is a common occurrence in England. Originally, the law, the state succeeding to the right of the crown. This was no doubt sufficient in the thirteen original states, which are not traversed by rivers of the largest size, but was not generally followed when it became obvious that new conditions, unknown in England, had arisen. Accordingly the soil of navigable rivers, fresh or salt, and of lakes, is vested in the state, which has power to regulate navigation and to establish a admirality jurisdiction of the United States extends to all public navigable rivers and lakes where commerce is carried on between different states or with foreign nations. (Grieve v. Catesby, 17 Howard's Rep. 443). And in a case decided in 1875, it was held that the great lakes are "high seas" within the meaning of $ 534 of the Revised Statutes (U.S. v. Rodgers, 150 U.S. Rep. 249). A state waterway established by service and authorized dams, but if water from a dam overflow a public highway, an indelible nuisance is caused. The right of eminent domain is exercised to a greater extent than in England in the compulsory acquisition of sites for mills and the like. The terms "waterway," "watercourse" and "watercourse" have been defined by A. J. Andrus (1902). The right of first user of a water has a right by priority of occurrence. If he give notice to the public of an intention to appropriate, provided that he be competent to hold land.

Authorities—Hall's Essays on the Rights of the Crown on the Seashore (1830) has been re-edited in 1875 and 1888. See also A. S. and H. S. Moore, History and Law of Fisheries (1903). Among American authorities are the works of Angell, Gould and Pomery, on Waters and Watercourses, Washburn on Easements, Angell on the Rights of Property in Tide Waters, Kinney on Irrigation and the Report to the Senate on Irrigation (1900).

WATER-SCORPION, an aquatic hemipodous insect of the family Nepidae, so called from its superficial resemblance to a scorpion, which is due to the modification of the legs of the anterior pair for prehension, and to the presence of a long slender process, simulating a tail, at the posterior end of the abdomen. The common British species, Niphargus, lives in ponds and stagnant water, and feeds upon aquatic animal organisms principally of the insect kind. Respiration in the adult is effected by means of the caudal process, which consists of a pair of half-tubes capable of being locked together to form a siphon by means of which air is conducted to the tracheae at the apex of the abdomen when the tip of the tube is thrust above the surface of the water. In mature forms the siphon is undeveloped and breathing takes place through six pairs of abdominal spiracles. The eggs, laid in the stems of plants, are supplied with seven filamentous processes which float freely in the water.

In Neph the body is broad and flat; but in an allied water-bug, Ranatra, which contains a single British species (R. lineatus), it is long and narrow, while the legs are very slender and elongate. Certain exotic members of this group, sometimes erroneously called scorpions, live in the hot, dry regions of the tropical land. Belostomatidae, are of large size, a South American species, Belostoma grande, reaching a length of between 4 and 5 in.

WATERSHED, in physical geography, the line separating the headstreams tributary to two different river-systems or basins. Alternative terms are "water-parting" and "divide." The crest of a mountain ridge forms the most clearly marked watershed; in a plain country of gentle slope (e.g. the central plain of Ireland) the watershed is often difficult to trace, as the head-waters of different river systems may merge in marshes or lakes at the highest levels. In a mountainous country, where two streams, flowing in opposite directions but having their sources adjacent, are both gradually eroding or cutting back the land at their heads, a pass is formed. In such cases, where one stream erodes faster than the other, the stronger may ultimately "behead" the weaker, and "capture" some of its waters, whose flow is diverted from one basin to another.

WATERSPOUT, a local vortical storm occurring over a water-surface, and in origin and form similar to a tornado (q.v.) on land. A brief summary is given under that heading. When considered as a pendant from the mass of storm-cloud above, seems to grow downwards, tapering, towards the water-surface, which is violently agitated, and finally (when the spout is fully developed) appears to be drawn up to meet the cloud from above. This appearance is deceptive, as the bulk of the water carried along by the whirling spout is condensed from the atmosphere, and, even when the spout is formed over a salt-water surface, is found to be fresh. Waterspouts occur most frequently over the warm seas of the tropics, but they are not confined to the warmer tropical seasons, or even low latitudes.
WATER SUPPLY

WATER SUPPLY. This article is confined to the collection and storage of water for domestic and industrial uses and irrigation, and its purification on a large scale. The conveyance of water is dealt with in the article AQUEDUCT.

Collecting Areas

Surface Waters.—Any area, large or small, of the earth’s surface from any part of which, if the ground were impermeable, water would flow by gravitation past any point in a natural watercourse is commonly known in Europe as the “hydrographic basin” above that point. In English it has been called indifferently the “catchment basin,” the “gathering ground,” the “drainage area” and the “watershed.” The latter term, though originally equivalent to the German Wasserseheide—water-parting is the best permissible translation. The water-parting is the line bounding such an area and separating it from other watersheds. The banks of a watercourse or sides of a valley are distinguished as the right and left bank respectively, the spectator being understood to be looking down the valley.

The surface of the earth is rarely impermeable, and the structure of the rocks largely determines the direction of flow of so much of the rainfall as sinks into the ground and is not evaporated. Thus the figure and area of a surface watershed may not be coincident with that of the corresponding underground watershed; and the flow in any watercourse, especially from a small watershed, may, by means of underground flow from or into other watersheds, be disproportionately to the area apparently drained by that watercourse.

When no reservoir exists, the volume of continuous supply from any watershed area is evidently limited to the minimum, or, so-called, extreme dry weather flow of stream. This cannot be determined from the rainfall; it entirely depends upon the period of the soil and rock to store water in the particular area under consideration, and to yield it continuously to the stream by means of concentrated springs or diffused seepage. Mountain areas of 10,000 acres and upwards, largely covered with moorland, upon nearly impermeable rocks with few water-bearing fissures, yield in temperate climates, towards the end of the dry season, and therefore solely from underground, between a fifth and a third of a cubic foot per second per 1000 acres. Throughout the course of the river Severn, the head-waters of which are chiefly supplied from such formations, this rate does not materially change, even down to the city of Worcester, past which the discharge flows from 1,256,000 acres. But in smaller areas, which on the average are necessarily nearer to the water-parting, the limits are much wider, and the rate of minimum discharge is generally smaller.

Thus, for example, on 1000 acres or less, it commonly falls to one-tenth of a cubic foot, and upon an upland Silurian area of 990 acres, giving no visible sign of any peculiarity, the discharge fell, on the 21st of September 1893, to one-thirty-fifth of a cubic foot per second per 1000 acres. In this case, however, some of the water probably passed between the beds and joints of rocks to an adjoining valley lying at a lower level, and had both streams been gauged the average would probably have been considerably greater. The Thames at Teddington, fed largely from cretaceous areas, fell during ten days in September 1898 (the artificial abstractions for the supply of London being added) to about one-sixth of a cubic foot, and since 1880 the discharge has occasionally fallen, in each of six other cases, to about one-fifth of a cubic foot per second per 1000 acres. Owing, however, to the very variable permeability of the strata, the tributaries of the Thames, when separately gauged in dry seasons, yield the most divergent results. It may be taken as an axiom that the variation of minimum discharges from their mean values increases as the separate areas diminish. In the eastern and south-eastern counties of England even greater variety of dry weather flow prevails than in the west, and upon the chalk formations there are generally no surface streams, except such as burst out after wet weather and form the so-called “bournes.” On the other hand, some rocks in mountain districts, notably the granites, owing to the great quantity of water stored in their numerous fissures or joints, commonly yield a much higher proportion of so-called dry weather flow.

When, however, a reservoir is employed to equalize the flow during and before the period of dry weather, the minimum flow continuously available may be increased to a much higher figure, depending upon the capacity of that reservoir in relation to the mean flow of the stream supplying it. In such a case the first essential in determining the yield is to ascertain the rainfall. For this purpose, if there are no rain-gauges on the drainage area in question, an estimate may be formed from numerous gaugings throughout the country, most of which are published in British Rainfall, initiated by the late Mr G. J. Symons, F.R.S., and now carried on by Dr H. K. Mill. But except in the hands of those who have spent years after passing the steep bank at C D—may be readily understood. Such examples show the importance of placing any rain-gauge, so far as possible, upon a plane surface of the earth—horizontal, or so inclined that, if produced, especially in the direction of prevailing winds, it will cut the mean levels of the area whose mean rainfall is intended to be represented by that gauge. It has been commonly stated that rainfall increases with the altitude. This is broadly true. A rain-cloud raised vertically upwards expands, cools and tends to precipitate, but in the actual passage of rain-clouds over the surface of the earth other influences are at work. In fig. 2 the thick line represents the profile of a vertical section crossing two ranges of hills and one valley. The arrows indicate the directions of the prevailing winds. At the extreme left the rain-clouds are thrown up, and if this were all, they would precipitate a larger proportion of the moisture than at the right, if the rainfall were from the west.

Since the above was written, this work has been taken over by the British Rainfall Organization.
WATER SUPPLY

[COLLECTING AREAS]

they contained as the altitude increased. But until the clouds rise above the hill there is an obvious countervailing tendency to compression, and in steep slopes this may reduce or entirely prevent precipitation. Drift and mist are more frequently their result, and only when the windward side of the hill is covered with an uninterrupted layer of cloud and there is an antecedent demand for moisture, will precipitation occur. The rain will generally be in the form of a shower, and not a steady fall, as the amount of the rainfall, when it occurs, is not likely to be large, except in the case of the small and isolated hills of the central United Kingdom. The passage of the raindrops through the atmosphere is a process of evaporation, and when it has passed the cloud base it is partly converted back into water vapour. This results in the lowering of the humidity and the increase of the falling temperature. As the raindrops fall through the atmosphere, they may either evaporate in part or be entirely absorbed by the vegetation, depending on the rate of evaporation and the absorptive capacity of the vegetation. The amount of rainfall that reaches the earth's surface depends on the efficiency of the drainage system and the storage capacity of the soil. The interception of raindrops by vegetation may also reduce the amount of rainfall that reaches the ground. The amount of rainfall that is not intercepted by vegetation may be lost by evaporation, infiltration, or runoff. The runoff may be either surface runoff or subsurface runoff, depending on the permeability of the soil and the slope of the land. The surface runoff may be further reduced by the formation of rivulets and streams, which then carry the water to the nearest body of water, such as a river, lake, or sea.

Rainfall is one of the most important factors affecting the hydrology of a region. It has a direct impact on the water balance, which is the difference between the inflow and outflow of water in a given area. The water balance is affected by many factors, including precipitation, evaporation, transpiration, and runoff. The water balance is important for the operation of water resources, such as reservoirs, aquifers, and rivers. The water balance can be used to predict the availability of water for different uses, such as agriculture, domestic water supply, and industrial water supply. The water balance is also important for the management of water resources, such as irrigation, flood control, and water quality.

The amount of rainfall that falls on a given area depends on a variety of factors, including the amount of water that is received from the atmosphere, the amount of water that is lost by evaporation, and the amount of water that is stored in the soil. The amount of rainfall that falls on a given area also depends on the amount of precipitation that falls on the area, the amount of water that is stored in the soil, and the amount of water that is lost by evaporation. The amount of rainfall that falls on a given area can be estimated using a variety of methods, including rainfall gauges, satellite imagery, and models. The amount of rainfall that falls on a given area can be used to predict the availability of water for different uses, such as agriculture, domestic water supply, and industrial water supply. The amount of rainfall that falls on a given area can also be used to manage water resources, such as irrigation, flood control, and water quality.

**WATER SUPPLY**

is concerned. In such a case most of the water is absorbed by the few upper inches of soil, only to be re-evaporated during the
next few days, and the small proportion which sinks into the
ground probably issues in springs many months later. Thus the
actual yield of rainfall to the stream depends largely upon
the mode of its time-distribution, and without a knowledge of
this it is impossible to anticipate the yield of a particular
rainfall. In estimating the evaporation to be deducted from
the rainfall for the purpose of determining the flow into a
reservoir, it is important to bear in mind that the loss from a
constant water surface is nearly one and a half times as great as
from the intermittently saturated land surface. Even neglecting
the isolated and local discharges due to excessive and generally
unrecorded rainfall, the variation in the discharge of all streams,
and especially of mountain streams, is very great. We have
seen that the average fall from mountain areas in Great Britain
towards the end of a dry season does not exceed one-fifth of a
cubic foot per second per 1000 acres. Adopting this general
minimum as the unit, we find that the flow from such areas up
to about 5000 acres, whose mean annual rainfall exceeds 50 in.,
may be expected occasionally to reach 300 cb. ft., or 1500 such
units; while from similar areas of 20,000 or 30,000 acres with
the same mean rainfall the discharge sometimes reaches 1200 or
1300 such units. It is well to compare these results with those
obtained from much larger areas but with lower mean rainfall.
The Thames at Teddington has been continuously gauged by
the Thames Conservators since 1883, and the Severn at Worcester
by the writer, on behalf of the corporation of Liverpool, during
the 10 years 1881 to 1890 inclusive. The highest flood, common
to the two periods, was that which occurred in the middle of
February 1883. On that occasion the Thames records gave a
discharge of 7-6 cb. ft. per second per 1000 acres, and the
Severn records a discharge of 8-6 cb. ft. per second per 1000
acres, or 38 and 43 respectively of the above units; while in
February 1881, before the Thames gaugings were commenced,
the Severn had risen to 47 of such units, and subsequently in
May 1888 rose to 50 such units, though the Thames, about the
same time only rose to 13. But in November 1894 the Thames
rose to about 80 such units, and old records on the Severn
bridges show that that river must on many occasions have risen
to considerably over 100 units. In both these cases the natural
maximum discharge is somewhat diminished by the storage
produced by artificial channelization of the rivers.

These illustrations of the enormous variability of discharge
serve to explain what is popularly so little understood, namely,
the advantage which riparian owners, or other persons
intending to derive fresh water from reservoirs constructed
primarily for the purpose of diverting the water of that stream—it may be to a totally
different watershed—for the purposes of a town supply. Under
modern legislation no such abstraction of water is usually allowed, even if limited to times of flood, except on condition of
an augmentation of the natural dry-weather flow, and this
condition at once involves the construction of a reservoir. The
water supplied to the stream from such a reservoir is known as
"compensation water," and is generally a first charge upon
these waters. This water is usually given a continuous and
uniform flow, when the small continuous pressure of the
water for the maintenance of the millers, as an intermittent one. In the manufacturing
districts of Lancashire and Yorkshire it generally amounts to one-third
of the whole so-called "available supply." In Wales it is usually
to about one-fourth, and elsewhere still less; but in any case it
amounts to many times the average unit of one-fifth of a cubic
foot per second per 1000 acres. Thus the benefit to the fisheries
and to the riparian owners generally is beyond all question; but the
cost to the water authority of conferring that benefit is
also very great—commonly (according to the proportion of the
natural flow intended to be rendered uniform) 20 to 35% of

The volume of compensation water is usually fixed as a given
fraction of the so-called "available supply" (which by a convention
that is most unfortunate, well is understood to be the average flow
of the stream during the three consecutive driest years).

Yield of stream with reservoir.
cumulatively by the straight line a a, its capacity must be such that it will hold not only the 11% surplus of the same year, but that, on June 10th, when this surplus has been used to satisfy the demand, it will still contain the water $c d = 19\%$ stored from a previous year; otherwise between June 10th and August 31st the reservoir will be empty and only the dry weather flow of the stream will be available for supply. In short, if the reservoir is to equalize the whole flow of this year, it must have a capacity equal to the greatest deficiency $c$ of the cumulative flow below the cumulative demand, plus the greatest excess $e$ of the cumulative flow over the cumulative demand. This capacity is represented by the height of the line $a ' a$ (drawn parallel to $a a$ from the point of maximum surplus $f$) vertically above the point of greatest deficiency $c$, and equal, on the vertical scale, to the difference between the height $c = 48\%$ and $e = 78\%$ or $30\%$ of the stream-flow during the driest year. A reservoir so proportioned to the stream-flow with a proper addition to avoid drawing off the bottom water, would probably be safe in Great Britain in any year.

After the reservoir begins to fall—in this case at the end of February—no ordinary change in the variation of demand can affect the question, subject of course to the cumulative demand not exceeding the reservoir yield from the rainfall. In assuming a demand at the beginning of the year below the mean, resulting in an overflow equal in this case to $b$ at the end of February and increasing our reservoir to meet it, we assume also that some additional supply to that reservoir beyond the $31\%$ of the average flow from the driest year can be obtained from the previous year. In relation to this supply from the previous year the most trying assumption is that the rainfall of that year, together with that of the driest year, will be the rainfall of the two consecutive years. We have already seen that while the rainfall of the driest of 50 years is about $63\%$ of the mean, that of the two driest consecutive years is about $75\%$ of the mean, and it follows, therefore, that immediately preceding the driest cannot have been less than about $87\%$ of the mean. As the loss by evaporation is a deduction lying between a constant figure and a duplicate proportional to the rainfall, we should err on the safe side in assuming the flow in the second driest year to be increased proportionally to the rainfall, by the difference which, as above stated, cannot be less than $87\%$ of the mean of 50 years—we may, as shown on fig. 3, extend our cumulative diagram of demand and flow into the reservoir from one to two years.

The whole diagram shows, by the greater gradient of the unbroken straight lines, the greater demand which can be safely assumed if the reservoir capacity is computed for a given uniform yield (represented cumulatively by a straight line corresponding with $a ' a$, but drawn over all the years instead of one), or conversely, having set up a suitable gradient at the most trying point in the line of cumulative flow ($c$ or $e$, in fig. 3—representing, in percentage of the total annual flow of the driest year, the capacity of reservoir which it may be convenient to provide) we may draw a straight line $a '' a''$ of uniform yield from the head of that vertical to the previous point of maximum excess of cumulative flow. The line $a '' a''$ drawn from zero parallel to the first line, produced to the boundaries of the diagram, will cut the vertical at the end of the first year at the percentage of the driest year’s flow which may be safely drawn continuously from the reservoir throughout the two years. It is to be observed that any irregularity in the rate of supply from the reservoir may occur between the critical periods of maximum excess of cumulative flow and maximum deficiency.
Note.—The figures in the right-hand column at the ends of the curved lines are inches of mean annual rainfall over a period of 50 years.

The co-ordinates to any point upon any curved line give respectively the required reservoir capacity and daily yield in gallons per acre of drainage area, corresponding with the mean annual rainfall represented by that curved line.

The curves have been drawn for a mean annual evaporation of 14 in. For any increased rate of evaporation 1½ in. are to be subtracted from the rainfall for each inch of evaporation above 14 in.

For any decreased rate of evaporation 1½ in. are to be added to the rainfall for each inch of evaporation below 14 in.

Any excess of evaporation from the water surface and allowance for bottom water are to be added to the storage so found.

The period over which the reservoir equalizes the flow is shown by the number of years marked on the straight radial lines.

Where the absolute minimum stream flow is known to be greater than the minimum of 7 cubic feet per second per 1000 acres (170 gallons per acre per day) assumed in the diagram, the capacity of the reservoir as taken from the diagram may be reduced by the amount corresponding to that minimum flow for the particular rainfall and evaporation.
of cumulative flow ($J$ and $r$ respectively, in the one year diagram) which does not increase the aggregate cumulative supply between those points, the line of cumulative supply from the reservoir to the line of cumulative flow into it.

From diagrams constructed upon these principles, the general diagram (fig. 4) has been produced. To illustrate its use, assume the case of a mean rainfall of 50 in., figured in the right-hand column at the top of the diagram, and of 200,000,000 gallons of evaporation, and of equal evaporation for each acre, which would result also of the yield by the proposed dam. We find on the left-hand scale that the height of the ordinate drawn to the 50-inch mean rainfall curve from 200,000 on the capacity scale, is 1,457 gallons per day per acre; and the straight radial line, which cuts the point of intersection of the curved line and the co-ordinates, tells us that the reservoir will equalize the flow of the two driest consecutive years. Similarly, if we wish to equalize the flow of the three driest consecutive years we change the co-ordinates to the radial line figured 3, and thus find that the available capacity of the reservoir must be 276,000 gallons per acre, and that in consideration of the additional expense of three driest consecutive years, we will increase the daily yield to 1,612 gallons per acre. In the same manner it will be found that by means of a reservoir having an available capacity of only 118,000 gallons per acre of the watershed, we might with the same rainfall and evaporation thus maintain a flow of 1,076 gallons per acre. In this case, the left-hand radial line passes through the point at which the coordinates meet, showing that the reservoir will just equalize the flow of all three driest years, and will yield any amount required, or the capacity required for any yield, corresponding with any mean rainfall from 30 to 100, and with the flow over any period, from the driest year to the six or more consecutive driest years, may be determined from the diagram.

It is instructive to note the ratio of increase of reservoir capacity and yield respectively for any given rainfall. Thus, assuming a mean rainfall of 60 in., during 50 years, subject to evaporation and losses equal to 14 in. throughout the dry period, we find from the diagram the following quantities (in gallons per acre of drainage area) and corresponding ratios:

On comparing columns 3 and 6 or 4 and 7 it appears that so great is the increase in the size of a reservoir in relation to its increased receipts, that only in the most favourable places for reservoir construction, or under the most pressing need, can it be worth while to go beyond the capacity necessary to render uniform the flow of the three driest consecutive years.

It must be clearly understood that the diagram, fig. 4, does not relieve the reader from any exercise of judgment, except as regards the net capacity of reservoirs which we have hitherto assumed to have been obtained. It is merely a geometrical determination of the conditions necessarily consequent in England, Scotland and Wales, upon a given mean rainfall over many years, upon evaporation and absorption in particular years (both of which he must judge or determine for himself), and upon certain limiting variations of the rainfall, already stated to be the result of numerous records maintained in Great Britain for more than 50 years. It must also be remembered that the reservoirs of a mountainous region, or those of a large area of the same capacity, in order that in the driest seasons fish life may be maintained and no foul water may be drawn off.

The conditions of Ireland and certain parts of Great Britain, the diagram will give results rather unduly on the safe side, as the extreme annual variations of rainfall are less than in most parts of Great Britain. Throughout Europe the annual variations follow nearly the same law as in Great Britain, but in some parts the distribution of rainfall in a single year is often more trying. The droughts are longer, and the rain, when it falls, especially along the Mediternanean coast, is often concentrated into shorter periods. Moreover, it often falls upon sun-heated rocks, thus increasing the evaporation for the time; but guaghons made by the writer in the northern Apennines indicate that this loss is more than compensated by the greater rapidity of the fall and the The average volume in such regions, therefore, for reservoirs equalizing the flow of 2 or more years, the capacity necessary does not materially differ from that required in Great Britain. As the tropics are approached, even in the form of springs, the inequalities become graver, and occasionally the rainy season is entirely absent for a single year, though the mean rainfall is considerable.

We have hitherto dealt only with the collection and storage of that portion of the rainfall which flows over the surface of nearly impermeable areas. Upon such areas the loss by percolation into the ground, not retrieved in the form of springs, is the principal of interest. Thus, springs may be neglected, and the only loss to the stream that is already considered of re-evaporation into the air and of absorption by vegetation. But the crust of the earth varies from almost complete impermeability to almost complete permeability. Among the sedimentary rocks we have, for example, in the clay slates of the Silurian formations, rocks no less cracked and fissured than others, but generally quite impermeable by reason of the joints being filled with the very fine clay resulting from the rubbing of slate upon slate in the former environment of the strata. In the Old Red Sandstone, the Greensand and the upper Chalk, we find the opposite extremes; while the igneous rocks are for the most part only permeable in virtue of the open fissures they contain. Wherever, below the surface, there are pores or open fissures, water derived from rainfall is (except in the rare cases of displacement by gas) found at levels above the sea determined by the resistance of solids to its passage towards some neighbouring sea, lake or watercourse. Any such level is commonly known as the level of saturation. The positions of springs are determined by permeable depressions in the surface of the ground below. From general principles of hydrology, it is evident that the holding up of that level locally by comparatively impermeable strata, sometimes combined with a fault or a synclinal fold of the strata, forming the more permeable portion into an underground basin or channel lying within comparatively impermeable boundaries. At the lower lips or at the most permeable parts of these basins or channels such rainfall does not flow over the surface, or is not evaporated or absorbed by vegetation, and does not, while still below ground reach the level of the sea, issues as springs, and is the cause of the continued flow of rivers and streams. The times during periods of very great rainfall in dry weather, of such flow, generally reduced to terms of the fraction of a cubic foot per second, per thousand acres of the contributing area, is commonly known in water engineering as the "dry weather flow" and its volume at the end of the dry season as the "extreme dry weather flow."
WATER SUPPLY

considerable depth, and by far the larger part of them through a great length of filtering material, and must have taken so long a time to reach the well that their organic character has disappeared. The principal water-bearing formations, utilized in Great Britain, are impermeable, and some of the most useful are the New Red Sandstone. The Upper and Middle Chalk are permeable almost through their mass. They hold water like a sponge, but part with it under pressure to fissures by which they are intersected, and, in the case of the Upper Chalk, to doubts following beds of flints. A well sunk in these formations without striking any fissure or water-bearing flint bed, receives water only at a very slow rate; but if, on the other hand, it strikes one or more of the natural water-ways, the quantity of water capable of being drawn from it will be greatly increased.

It is a notable fact in the fissure systems of the Middle Chalk formations that below their present valleys the underground water passes more freely than elsewhere. This is explained by the fact that the Chalk fissures are almost invariably rounded and enlarged by the erosion of carbonic acid carried from the surface by the water passing through them. These fissures take the place of the streams in an impermeable area, and those beneath the valleys must obviously be called upon to discharge more water from the surface, and thus be brought in contact with more carbonic acid, than similar fissures elsewhere. Hence the exact position for a well in the Chalk is generally that over which, if the strata were without a core of which the absorbing power of surface-water would flow. The Lower Chalk formation is for the most part impermeable, though it contains many ruptures and dislocations or smashes, in the interstices of which large bodies of water, received from the Upper and Middle Chalk, may be naturally stored, or which may merely form passages for water derived from the Upper Chalk. Thus despite the impermeability of its mass large springs are occasionally found to issue from the Lower Chalk. A striking example is that known as Lydden Spout, under Abbot's Cliff, near Dover. In practice it is usual in chalk formations to imitate artificially the action of such underground watercourses, by driving from the well small tunnels, or "adits" as they are called, below the water-level, to intercept fissures and water-bearing beds, and thus extend the collecting area.

Next in importance to the Chalk formations as a source of underground water supply comes the Trias or New Red Sandstone, consisting in Great Britain of two main divisions, the Keuper above and the Bunter below. With the exception of the Red Marls forming the upper part of the Keuper, most of the New Red Sandstone is impermeable, when saturated, even more water than solid chalk; but while as in the case of the chalk, a well or borehole in the sandstone yields very little water unless it strikes a fissure; hence, in New Red Sandstone also, it is a common thing to form underground chambers or adits in search of additional fissures, and sometimes to sink many vertical boreholes with the same object in view.

As the formation approaches the condition of pure sand, the water-bearing property of any given mass increases, but the difficulty of drawing water from it without admixture of sand also increases. In sand below water there are, of course, no open fissures, and even if adit driven, the cost of constructing and lining them through the loose sand would be prohibitive. The well itself must be lined; and its yield is therefore confined to such water as can be drawn through the sides or the bottom of the lining without setting up a sufficient velocity to cause any sand to flow with the water. Hence it arises that, in sand formations, only shallow wells or small boreholes are commonly found. Imagine for a moment that the sand grains were by any means rendered immobile without change in the permeability of their interspaces; we could then employ with the larger or brick-like lining of the well; but as there would still be no cracks or fissures to extend the area of percolating water exposed to the open well, the yield would be very small. Obviously, it must be very much smaller when the lining necessary to hold up loose sand is used. Uncemented brickwork, or perforated ironwork, are the usual materials employed for lining the well and holding up the sand, and the quantity of water drawn is kept below the comparatively small quantity necessary to produce a velocity, through the joints or orifices, capable of disturbing the sand. The rate of increase of velocity towards any isolated aperture through which water passes into the side of a well sunk in a deep bed of sand is, in the neighbourhood of that aperture, inversely proportional to the square of the distance therefrom. Thus, the velocity across a little hemisphere of sand only \( \frac{1}{2} \) in. radius covering a 1-in. orifice in the lining is more than 1000 times the mean velocity of the same water approaching the orifice radially when 16 in. therefrom. This illustration gives some idea of the enormous increase of yield of such a well, if, by any means, we can get rid of the frictional sand, even from within the 10 in. radius. We cannot do this, but happily the grains in a sand formation vary widely in diameter, and if, from the interstices between the larger grains in the neighbourhood of an orifice, we can remove the finer grains, the resistance to flow of water is at once enormously reduced. This was for the first time successfully done in a well, constructed by the Biggleswade Water Board in 1902, and now supplying water over a large area of North Bedfordshire. This well, 10 ft. diameter, was sunk through about 110 ft. of surface soil, glacial drift and impermeable gault clay and thence for a further depth of 70 ft. into the Lower Greensand formation, the outcrop of which is at the level of the floor of the Wash, passes south-westwards, and in Bedfordshire attains a thickness exceeding 250 ft. The formation is probably more or less permeable throughout; it consists largely of loose sand and takes the general south-easterly dip of British strata. The Biggleswade well was sunk by processes better known in connexion with the sinking of mine shafts and foundations of bridges across the deep sands or gravels of bays, estuaries and great rivers. Its full capacity has not been ascertained; it much exceeds the present pumping power, and is probably greater than that of any other single well assisted by adits or boreholes. This result is mainly due to the reduction of frictional resistance to the passage of water through the sand in the immediate neighbourhood of the well, by washing out the finer particles of sand and leaving only the coarser particles. For this purpose the lower 45 ft. of the cast-iron cylinders forming the well was provided with about 660 small orifices lined with gun-metal tubes or rings, each armed with numerous thicknesses of copper wire gauze, and temporarily closed with screwed plugs. On the removal of any plug, this wire gauze prevented the sand from flowing with the water into the well; but while the finer sand became washed away, the rate of flow of water through the contracted area was very small. To remove this obstruction the water was pumped out while the plugs kept the orifices closed. A flexible pipe, brought down from a steam boiler above, was then connected with any opened orifice. This pipe was provided, close to the orifice, with a three-way cock, by means of which the steam might be first discharged into the sand, and the current between the cock and the well then suddenly reversed and diverted into the well. The effect of thus alternately forcing high-pressure steam among the sand and then allowing it to escape, is to pack the sand into the well, is to break up any cohesion of the sand, and to allow all the finer particles in the neighbourhood of the orifice to rush out with the water through the wire gauze into the well. This process, in effect, leaves each orifice surrounded by a hemisphere of coarse sand across which the water flows with comparative freedom from a larger hemisphere where the corresponding velocity is very slow, and where the presence of finer and more obstructive particles is therefore unimportant. Many orifices through which water at first only dribbled were thus caused to discharge water with great force, and entirely free from sand, against the opposite side of the well, while the general result was to increase the inflow of water many times, and to entirely prevent the intrusion of sand. Where, however, a firm rock of any kind is encountered, the yield of a well (under a given head of water) can only be increased by enlargement.
of the main well in depth or diameter, or by boreholes or adits.

No rule as to the adoption of any one of these courses can be laid down, nor is it possible, without examination of each particular case, to decide whether it is better to attempt to increase the yield of the well or to construct an additional well some distance away. By lowering the head of water in any well which draws its supply from porous rock, the yield is always temporarily increased. Every well has its own particular level of water while steady pumping at a given rate is going on, and if that level is lowered by harder pumping, it may take months, or even years, for the water in the interstices of the rock to accommodate itself to the new conditions; but the permanent yield after such lowering will always be less than the quantity capable of being pumped shortly after the change. We have hitherto supposed the pumps for drawing the water to have been placed in the well at such a level as to be accessible, while the suction pipe only is below water. Pumps, however, may be (and have been) placed deep down in boreholes, so that water may be pumped from much greater depths. By this means the head of pressure in the boreholes tending to hold the water back in the rock is reduced, and the supply consequently increased; but when the cost of maintenance is included, the increased supply from the adoption of this method rarely justifies the experiment. When the water has been lowered by pumping to a lower level its passage through the sandstone or chalk in the neighbourhood of the borehole is further resisted by the smaller length of borehole below the water; and there are many instances in which repeated lowering and increased pumping, both from wells and boreholes, have had the result of reducing the water available, after a few years, nearly to the original quantity. One other method—the use of the so-called "air-lift"—should be mentioned.

Air-lift. This ingenious device originated in America. The object attained by the air-lift is precisely the same as that attained by pumping; it consists in increasing the head of the water in point of pressure, but instead of the head being reduced by means of the pump, it is reduced by mixing the water with air. A pipe is passed down the borehole to the desired depth, and connected with air-compressors at the surface. The compressors being set to work, the air is caused to issue from the lower end of the pipe and to mix in fine bubbles with the rising column of water, sometimes several hundred feet in height. The weight of the column of water, or rather of water and air mixed, is thus greatly reduced. The method will therefore always increase the yield for a given draw down by the pump, and in proportion to the reduction of weight. This, of course, means that the water of such a borehole will be more easily accessible, and its economic usefulness less than at first, but its economy must always be less than that of direct pumping.

In considering the principles of well supplies it is important to bear the following facts in mind. The crust of the earth, so far as it is permeable and above the sea-level, receives from rainfall its supply of fresh water. That supply, so far as it is not evaporated or absorbed by vegetation, passes away by the streams or rivers, or sinks into the ground. If the strata were uniformly porous the water would lie in the rock at different depths below the surface according to the previous quantity and distribution of the rainfall. It would slowly, but constantly, percolate downwards and towards the sea, and would ooze out at or below the sea-level, rarely regaining the earth's surface earlier except in deep valleys. Precisely the same thing happens in the actual crust of the earth, except that, in the formations usually met with, the strata are so irregularly permeable that no such uniform percolation occurs, and most of the water, instead of oozing out near the sea-level, meets with obstructions which cause it to issue, sometimes below the sea-level and sometimes above it, in the form of concentrated springs. After prolonged and heavy rainfall the upper boundary of the sub-soil water is, except in high ground, nearly coincident with the surface. After prolonged droughts it still retains more or less the same figure as the surface, but at lower depths and always with less pronounced differences of level.

Sedimentary rocks, formed below the sea or salt lagoons, must originally have contained salt water in their interstices. On the upheaval of such rocks above the sea-level, fresh water from rainfall began to flow over their exposed surfaces, and, so far as the strata were permeable, to lie in their interstices upon the salt water. The weight of the original salt water above the sea-level, and of the fresh water so superimposed upon it, caused an overflow towards the sea. A hill, as it were, of fresh water rested in the interstices of the rock upon the salt water, and continuing to press downwards, forced out the salt water even below the level of the sea. Subject to the rock being porous this process would be continued until the greater column of the lighter fresh water balanced the smaller head of sea water. It would conceivably take but a small fraction of the period that has in most cases elapsed since such upheaval occurred for the salt water to be thus displaced by fresh water, and for the condition to be attained as regards saturation with fresh water, in which with few exceptions we now find the porous portions of the earth's crust wherever the rainfall exceeds the evaporation. There are cases, however, as in the valley of the Jordan, where the ground is actually below the sea-level, and where, as the total evaporation is equal to or exceeds the rainfall, the lake surfaces also are below the sea-level. Thus, if there is any percolation between the Mediterranean and the Dead Sea, it must be towards the latter. There are cases also where sedimentary rocks, formed below the sea or salt lagoons, are entirely impermeable: thus the salt deposited in parts of the Upper Keuper of the New Red Sandstone, is protected by the red marls of the formation, and has never been washed out. It is now worked as an important industry in Cheshire.

Perhaps the most instructive cases of nearly uniform percolation in nature are those which occur in some islands or peninsulas formed wholly of sea sand. Here water is maintained above the sea-level by the annual rainfall, and may be drawn off by wells or bores. On such an island, in the centre of which a borehole is put down, brackish water may be reached far below the sea-level; the salt water forming a saucer, as it were, in which the fresh water lies. Such a salt-water saucer of fresh water is maintained full to overflowing by the rainfall, and owing to the frictional resistance of the sand and to capillary action and the fact that a given column of fresh water is balanced by a shorter column of sea water, the fresh water never sinks to the mean sea-level unless artificially abstracted.

Although such uniformly permeable sand is rarely met with in great masses, it is useful to consider in greater detail so simple a case. Let the irregular thick line in fig. 5 be the section of a circular island a mile and a quarter in diameter, of uniformly permeable sand.

The mean sea-level is shown by the horizontal line aa, dotted where it passes through the land, and the natural mean level of saturation be bb, above the sea-level, by a curved dot and dash line. The water, contained in the interstices of the sand above the mean sea-level, would (except in so far as a film, coating the sand particles, is held up by capillary attraction) gradually sink to the sea-level if there were no rainfall. The resistance to its passage through the sand is, however, sufficiently great to prevent this from occurring while percolation of the annual rainfall takes place.

Hence we may suppose that a condition has been attained in which the denser salt water below and around the saucer CC (greatly exaggerated in vertical scale) balances the less dense, but deeper
water whatever. Thus natural or artificial surfaces which are completely permeable to rainfall may become almost impermeable when protected by surface water from direct rainfall. Such an extent as to form a earthwork to prevent vegetation and artificial disturbance. The cause of this choking of the pores is precisely the same as that described below in the case of sand filters. But in order that the action may be possible the initial resistance to percolation of water at every part of the soil must be such that the motion of the water through it shall be insufficient to disturb the water-borne mineral and organic particles lodged on the surface or in the interstices of the soil. If, therefore, a reservoir so formed survives the first few years without serious leakage, it is not likely, in the absence of artificial disturbance, to stand much longer. However, as the survival of the fittest, there are many artificial wastes, with low dams consisting exclusively of earth—and sometimes very sandy earth—safely and satisfactorily performing their functions with no visible leakage. But it is never advisable to rely upon this action, where, as in the case of a reservoir for water supply, large portions of naturally permeable bottom are liable to be uncovered and exposed to the weather.

The most important dams are those which close the outlets of existing valleys, but a dam may be wholly below ground, and according to the commoner method of construction the rising ground is not met with at the intended boundary of a reservoir, a trench is cut along such portion, and carried down to rock or such other formation as, in the engineer's opinion, forms a sufficiently impermeable sheet beneath the whole surface to be covered with water. Into this trench so-called "puddled clay," that is, clay rendered plastic by kneading with water, is filled and thoroughly worked with special tools, and trodden in layers. In this manner an underground compartment is formed, the bottom of which is natural, and the sides partly natural and partly artificial, both offering support to the passage of water. Above ground, if the water level is to be higher than the natural boundary, the same puddle walls or cores are carried up to the required level, and are supported as they rise by embankments of earth on either side.

Fig. 6 is a typical section of a low dam of this class, impounding water upon gravel overlying impermeable clay. In such a structure the whole attention as regards water-tightness should be concentrated upon the puddle wall or core. When, as may happen in dry seasons, the puddle wall remains long above the water level, it parts with moisture and contracts. It is advisable in such cases to provide a small depression in the surface, which may possibly produce cracking. Drying is retarded, and the contraction due to a given degree of drying is greatly reduced, by the presence of sand and small stones to the requisite extent. If the surface is not thrown up, naturally contain sand and stones, 40 to 50%, by weight of which is not too much if uniformly distributed and if the clay is otherwise good. But in the lower parts of the trench, where the clay can never become dry, plasticity and ductility are, for reasons to be explained below, the first consideration, and there the proportion of grit should be lower. The resistance of clay to percolation by water depends chiefly upon the density of the clay, while the density is rapidly reduced if the clay is permitted to absorb water. Thus, if dry clay is prevented from expanding, and one side be subjected to water pressure while the other side is held up by a completely drained medium, the percolation will be exceedingly small; but if the pressure preventing the expansion is reduced the clay will swell, and the percolation will increase. On the restoration of the pressure, the density will again increased by the reduction of the
WATER SUPPLY

Water-filled interstices, and the percolation will be correspondingly checked. Here the extreme importance in high dams with clay cores of loading the clay well for some time before water pressure is brought against it. If this is done, the largest possible quantity of clay will be slowly but surely forced into any space, and, being prevented from expanding, it will be unable subsequently to absorb more water. The percolation will then be very small, and the risk of disintegration will be reduced to a minimum. The embankments on either side of the puddle wall are merely to support the puddle and to keep it moist above the ground level when the reservoir is low. They may be quite permeable, but to prevent undue settlement and distortion they must, like the puddle itself, be well consolidated. In order to prevent a tendency to slip, due to sudden and partial changes of saturation, the outer embankment should always be permeable, and well drained at the base, as well as close to the puddle. The less permeable materials should be confined to the inner parts of the embankments; this is especially important in the case of the inner embankment in order that, when the water level falls, they may remain moist without becoming liable to slip. The inner slope should be protected from the action of waves by so-called "hand-pitching," consisting of roughly-squared stonework, bedded upon a layer of broken stone to prevent local disturbance of the embankment by action of the water between the joints of the larger stones.

In mountain valleys, rock, or shales, commonly the most impermeable material met with in such percolation, is sometimes not reached till considerable depths are attained. There are several cases in Great Britain where it has been necessary to carry down the puddle trench to about 200 ft. below the surface of the ground vertically above those parts. The highest dams of this class in the British islands impound water to a level of about 110 ft. above the bottom of the valley. Such great works have generally been well constructed, and there are many which after fifty years of use are perfectly sound and water-tight, and afford no evidence of deterioration. On the other hand, the partial or total failure of smaller dams of this description, to retain the reservoir water, has been much more common in the past than is generally supposed. Throughout Great Britain there are still many reservoirs, with earthen dams, which cannot safely be filled; and others, which, after remaining in a dangerous condition, have been repaired. From such cases and their successful repair valuable experience of the causes of failure may be derived.

Most of these causes are perfectly well understood by experienced engineers, but instances of

Erosion by malconstruction of recent date are still met with, and a few such cases will now be glanced at.

A puddle trench is often found to have been placed upon rock, perfectly sound in itself, but having joints which are not impermeable. The loss of water by leakage through such joints or fissures below the puddle wall may or may not be a serious matter in itself; but if at any point there is sufficient movement of water across the base of the trench to produce the slope of the juction of the clay above it, that movement almost invariably increases. The finer particles of clay in the line of the joint are washed away, while the sandy particles, which nearly all natural clays contain, remain behind and form a constantly deepening porous vein of sand crossing the base of the puddle. Percolation through this sand is thus added to the original leakage. Having passed through the puddle core the leaking water sometimes rises to the surface of the ground, producing a visible turbid spring. As erosion proceeds, the contraction of the space from which the clay is washed continues, chiefly by the sinking down of the clay above the sand. Thus the permeable vein grows vertically rather than horizontally, and ultimately assumes the form of a thin vertical sheet traversing the puddle wall, often diagonally in plan, and having a thickness which has varied in different cases from a few inches to a couple of feet or more, of almost clean sand rising to an observed height of 30 or 40 ft., and only arrested in its upward growth by the necessary lowering of the reservoir water to avoid serious danger. The settlement of the plastic clay above the eroded portion soon produces a surface depression at the top of the embankment over or

\[ \text{Fig. 8.—Leakage due to improperly formed discharge culvert through puddle wall of reservoir.} \]
WATER SUPPLY

Fig. 9.—Overhanging Rock Leakage. The lesson taught by fig. 8 applies also to the ends of puddle walls where they abut against steep faces of rock. Unless such faces are so far below the surface of the puddle, and so related to the lower parts of the trench, that no tension, and consequent tensile separation of the puddle from the rock, can possibly take place, and unless abundant time is given, before the reservoir is charged, for the settlement and compression of the puddle to be completed, leakage with disastrous results may occur.

In other cases leakage and failure have arisen from allowing part of the rock bottom or end of a puddle trench to overhang, as in fig. 9. Here the straining of the original horizontal puddle in settling down is indicated in a purposely exaggerated way by the curved lines. There is considerable distortion of the clay, resulting from combined shearing and tensile stress, above each of the steps of rock, and reaching its maximum at and above the highest rise of the rock, where it has proved sufficient to produce a dangerous line of weakness. The tension at the top of the rock may be caused by actual rupture, or such increased porosity as to permit of percolation capable of keeping open the wound. In such cases as are shown in figs. 8 and 9 the growth of the sand vein is not vertical, but inclined towards the plane of maximum shearing strain. Fig. 9 also illustrates a weak place at b where the clay either never pressed hard against the overhanging rock or has actually been drawn away from it in the process of settling towards the lower part of the rock. When it is considered that a parting of the clay, sufficient to allow the thinnest film of water to pass, may start the formation of a vein of porous sand in the manner above explained, it will be readily seen the attention of the engineer, in preventing percolation, is to be directed to the placing of puddle clay deep enough to prevent the escape of water to the lower part of the reservoir.

If no considerable difference of water-pressure had been allowed between the two sides of the puddle trench in figs. 8 or 9 until the clay had ceased to settle under its own weight, it is probable that the interstices, at first formed between the puddle and the concrete or brickwork, would have been sufficiently filled to prevent injurious percolation in the future. Hence it is always safe to permit of percolation at the expense of time in order that the settlement of the clay around the rock may be decided.

Such precautions should be added to the use of concrete or brickwork tongues running longitudinally at the bottom of the trench, such as those shown at a higher level in fig. 7.

In addition to defects arising out of the condition or figure of the rock, if puddle work upon which rests the rock wall is itself defective, the original material may have been perfectly satisfactory, but if, for example, in the progress of the work a stream of water is allowed to percolate down the rock, or a wall of water is washed at the surface, gravel or sand associated with it to a sufficient extent to permit of future percolation. Unless such places are carefully dug out or re-puddled before the work of filling is resumed, the percolation may increase along the vertical plane where it is greatest, by the erosion and falling in of the clay roof, as in the other cases cited.

Two instances probably originating in some such cause are shown in fig. 11 in the relative positions in which they were found, and carefully measured, as the puddle was removed from a cleft reservoir dam. These fissures are in vertical planes stretching entirely across the puddle trench, and reaching in one case 63, nearly to the highest level at which the reservoir had been worked for nineteen years after the leakage had been discovered. The larger and older of these veins was 44 ft. high, of which 11 ft. was above the original ground level, and it is interesting to note that this portion, owing probably to easier access for the water from the reservoir and reduced compression of the puddle, was much wider than below. The little vein to the left marked 60, about 36 ft. deep, is curious. It looks like the beginning of success of an effort made by a slight percolation during the whole life of the reservoir to increase itself materially by erosion.

Fig. 11.—Vertical Vein of Leakage.

There is no reason to believe that the initial cause of such a leakage could be developed except during construction, and it is certain that once begun it must increase. Only a knowledge of the great loss of capital that has resulted from abortive reservoir construction justifies this notice of defects which can always be avoided, and are too often the direct result, not of design, but of parsimony in providing during the execution of such works, and especially here below, a sufficiency of intelligent, experienced, and conscientious supervision.

In some cases, as, for example, when a high earthen embankment ceases a gorge, and there is plenty of stone to be had, it is desirable to place the outer hard upon a toe or platform of rubble-stones, as in fig. 7, by which means the height of the earthen portion is reduced and complete drainage secured. But here again great care must be exercised in the packing and consolidation of the stones, which will otherwise crack and settle.

As with many other engineering works, the tendency to slipping of the sides of the valley or of the reservoir itself has often given trouble, and has sometimes led to serious disaster.
This, however, is a kind of failure not always attributable to want of proper supervision during construction, but rather to improper choice of the site, or treatment of the case, by those primarily responsible.

In countries where good clay or retentive earth cannot be obtained, numerous alternative expedients have been adopted with more or less success. In the mining districts of America, for example, where timber is cheap, rough stone embankments have been lined with the water face, and timber fitted to form the water-tight septum. In such a position, even if the timber can be made sufficiently water-tight to begin with, the alternate immersion and exposure to air and sunshine promotes expansion and contraction, and induces rapid disintegration, leakage and decay. Such an expedient may be justified by the doubtful future of mining centres, but would be out of the question for permanent water supply. Riveted sheets of steel have been occasionally used, and, where bedded in a sufficient thickness of concrete, with success. At the East Caliton Creek dam, Utah, the height of which is about 61 ft., above the stream, the trench below ground was filled with concrete much in the usual way, while above ground the water-tight diaphragm consists of a riveted steel plate varying in thickness from $\frac{3}{4}$ in. to 3 in. This steel septum was protected on either side by a thin wall of asphaltic concrete supported by rubble stone embankments, and owing to irregular settling of the embankments became greatly distorted, apparently, however, without causing leakage. Asphalt, whether a natural product or artificially obtained, as, for example, in some chemical manufactures, is a most useful material if properly employed, but the ordinary asphalt, under sudden impact it is brittle, and has a conchoidal fracture like glass; but under continued pressure it has the properties of a viscous fluid. The rate of flow is largely dependent upon the proportion of bitumen it contains, and is of course retarded by mixing it with sand and stone to form what is commonly called asphalt concrete. But given time, all such compounds, if they contain enough bitumen to render them water-tight, appear to settle down even at ordinary temperatures as heavy viscous fluids, retaining their fluidity permanently if not exposed to the air. Thus they not only penetrate all cavities in an exceedingly small manner, but exert pressures in all directions, which, owing to the density of the asphalt, are more than 40% greater than would be produced by a corresponding depth of water. From the neglect of these considerations numerous failures have occurred.

Elsewhere, a simple concrete or masonry wall or core has been used above as well as below ground, being carried up between embankments either of earth or rubble stone. This construction has received its highest development in America. On the Titicus, a tributary of the Croton river, an earthen dam was completed in 1805, with a concrete core wall 100 ft. high—almost wholly above the original ground level, which is said to be impermeable; but other dams of the same system, with core walls of less than 100 ft. in height, are apparently in their present condition not impermeable. Reservoir No. 4 of the Boston waterworks, completed in 1885, has a concrete core wall. The embankment is 1800 ft. long and 60 ft. high. The core wall is about 8 ft. thick at the bottom and 4 ft. thick at the top, and in the middle of the valley nearly 100 ft. in height. At irregular intervals of 150 ft. or more buttresses 3 ft. wide and 7 ft. thick break the continuity on the water side. That this work has been regarded as successful is shown by the fact that Reservoir No. 6 of the same waterworks was subsequently constructed and completed in 1894 with a similar core wall. There is no serious difficulty in so constructing walls of this kind as to be practically water-tight while they remain unbroken; but owing to the settlement of the earthen embankments and the changing level of saturation they are undoubtedly subject to irregular stresses which cannot be calculated, and under which, speaking generally, plastic materials are much safer. In Great Britain or concrete core walls have been generally confined to positions below ground. Thus placed, no serious strains are caused either by changes of temperature or of moisture or by movements of the lateral supports, and with proper ingredients and care a very thin wall wholly below ground may be made water-tight.

The next class of dam to be considered is that in which the structure as a whole is so bound together that, with certain reservations, it may be considered as a monolith subject chiefly to the overturning tendency of water-pressure resisted by the weight of the structure itself and the supporting pressure of the foundation. Masonry dams are, for the most part, merely retaining walls of exceptional size, in which the overturning pressure is water. If such a dam is sufficiently strong, and is built upon sound and moderately rough rock, it will always be incapable of sliding. Assuming also that it is incapable of crushing under its own weight and the pressure of the water, it must, in order to fail entirely, turn over on its outer toe, or upon the outer face at some higher level. It may do this in virtue of horizontal water-pressure alone, or of such pressure combined with upward pressure from intrusive water at the base in any other horizontal plane. Assume first, however, that there is no uplift from intrusive water. As the pressure of water is nil at the surface and increases in direct proportion to the depth, the overturning moment is as the cube of the depth; and the only figure which has a moment of resistance due to gravity, varying also as the cube of its depth, is a triangle. The form of stability having the least sectional area is therefore a triangle. It is obvious that the angles at the base of such a hypothetical dam must depend upon the relation between its density and that of the water. It can be shown, for example, that for masonry having a density of 3, water being 1, the figure of minimum section is a right-angled triangle, with the water against its vertical face; while for a greater density the water face must lean towards the water, and for a less density away from the water, so that the water may lie upon it. For the sections of masonry dams actually used in practice, on designed on the condition that the centre of all vertical pressures when the reservoir is full shall be, as hereafter provided, at two-thirds the width of the base from the inner toe, the least sectional area for a density of 2 also has a vertical water face. As the density of the heaviest rocks is only 3, that of a masonry dam must have its vertical water face also. For these densities, the deviation of the water face from the vertical in the figure of least sectional area is, however, so trifling that, so far as this consideration is concerned, it may be neglected.

If the right-angled triangle $abc$, fig. 12, be a profile 1 ft. thick of a monolithic dam, subject to the pressure of water against its vertical side to the full depth $ab = d$ in feet, the horizontal pressure of water against the section of the dam, increasing uniformly with the depth, is properly represented by the isocles right-angled triangle $abe$, in which $be$ is the maximum water-pressure due to the full depth $d$, while the area $\frac{1}{2}ab = \frac{1}{2}d^2$ is the total horizontal pressure against the dam, generally stated in cubic feet of water, acting at one-third its depth above the base. Then $\overline{ac}$ is the resultant horizontal pressure with an overturning moment of

$$\frac{d^2}{6}$$

(1)

If $b$ be the width of the base, and $\rho$ the density of the masonry, the weight of the masonry in terms of a cubic foot of water will be $\frac{\rho d b}{3}$ acting at its centre of gravity $g$, situated at $\frac{3}{4}b$ from the outer toe, and the moment of resistance to overturning on the outer toe,

$$\frac{\rho d b}{3}$$

(2)
Equating the moment of resistance (2) to the overturning moment (1), we have
\[
\frac{\text{axd}}{3} = d^2
\]
and
\[
x = \frac{d}{\sqrt{2p}} \quad \quad \quad (3)
\]
That is to say, for such a monolith to be on the point of overturning under the horizontal pressure due to the full depth of water, its base must be equal to that depth divided by the square root of twice the density of the monolith. For a density of 2.5 the base would therefore be 44.7% of the height.

We have now to consider what are the necessary factors of safety, and the modes of their application. In the first place, it is out of the question to allow the water to rise to the vertex \(a\) of such a masonry triangle. A minimum thickness must be adopted to give substance to the upper part; and where the dam is not used as a weir it must necessarily rise several feet above the water, and may in either event have to carry a roadway. Moreover, considerable mass is required to reduce the internal strains caused by changes of temperature. In the next place, it is necessary to confine the pressure, at every point of the masonry, to an intensity which will give a sufficient factor of safety against crushing. The upper part of the dam having been designed in the light of these conditions, the whole process of completing the design is simple enough when certain hypotheses have been adopted, though somewhat laborsious in its more obvious form. It is clear that the greatest crushing pressure must occur, either, with the reservoir empty, near the lower part of the water face \(ab\), or with the reservoir full, near the lower part of the outer face \(ac\). The principles hitherto adopted in designing masonry dams, in which the moment of resistance depends upon the figure and weight of the masonry, involves certain assumptions, which, although not quite true, have proved useful and harmless, and are so convenient that they may be continued with due regard to the modifications which recent investigations have suggested. One such assumption is that the dam is so well built, the intensity of vertical pressure will (neglecting local irregularities) vary nearly uniformly from face to face along any horizontal plane. Thus, to take the simplest case, if also (fig. 13) represents a rectangular mass already designed for the superstructure

of the dam, and \(g\) its centre of gravity, the centre of pressure upon the base will be vertically under \(g\), that is, at the centre of the base, and the load will be properly represented by the rectangle \(bfc\), of which the area represents the total load and the uniform depth of its uniform intensity. At this high part of the structure the intensity of pressure may be nearly uniform, much less than its permissible intensity. If now we assume the water to have a depth \(d\) above the base, the total water pressure represented by the triangle \(kbb\) will have its centre at \(d/3\) from the base, and by the parallelogram of forces, assuming the density of the masonry to be 2.5, we find that the centre of pressure upon the base \(bc\) is shifted from the centre of the base to a point \(j\) nearer to the outer toe \(e\), and adopting our assumption of uniform intensity of forces, the rectangular diagram of pressures will thus be distorted from the figure \(bfg\) to the figure of equal area \(bjfc\), having its centre \(o\) vertically under the point at which the resultant of all the forces cuts the base \(bc\). For any lower level the same treatment may be made, step by step, be adopted, until the maximum intensity of pressure \(e\) exceeds the assumed permissible intensity for the centre of pressure reaches an assigned distance from the outer toe \(e\), when the base must be widened until the maximum intensity of pressure or the centre of pressure, as the case may be, is brought within the prescribed limit. The resultant force of the kind shown in fig. 13.

Having thus determined the outer profile under the conditions hitherto assumed, it must be similarly ascertained that the water face is everywhere capable of resisting the vertical pressure of the masonry when the reservoir, and under the assumption of the base of each compartment must be widened if necessary in that part and the dam widened above 100 ft. in height, further adjustment of the outer profile may be required by reason of the deviation of the inner profile from the straight.

The effect of this process is to give a series of points in the horizontal planes at which the resultant of all forces above those planes respectively cut the plane. Curved lines, indicated in fig. 14, drawn through these points give the centre of pressure, for the reservoir full and empty respectively, at any horizontal plane. The general principles were given by Messrs. Grasen and Deloré of the Ponts et Chaussées, and about the year 1866 were put into practice in the Furens dam near St Etienne. In 1871 the late Professor Rankine, F.R.S., whose remarkable perception of the practical fitness of solutions, and the modesty of his over-valued conclusions gives his writings exceptional value, received from Major Tulloch, R.E., on behalf of the municipality of Bombay, a request to consider the subject generally, and with special reference to very high dams, such as had not been constructed in India. Rankine pointed out that before the vertical pressure reached the maximum pressure permissible, the pressure tangential to the slope might do so. Thus conditions of stress are conceivable in which the maximum would be tangential to the slope or nearly so, and would therefore increase the vertical stress in proportion to the coscentic squared of the slope. It is very doubtful whether this pressure is ever reached, but such a limit, rather than that of the vertical stress must be considered when the height of a dam demands it. Next, Rankine pointed out that in a structure exposed to the overturning action of forces which fluctuate in amount and direction, there should be no appreciable tension at any point of the masonry. But there is a still more important reason why this condition should be strictly adhered to as regards the inner face. We have hitherto considered only the horizontal pressure of the water; but if from originally defective construction, or from the absence of vertical pressure due to weight of masonry towards the water edge of any horizontal bed, as at \(ab\) in fig. 14, water intrudes beneath that part of the masonry more readily than it can obtain egress along \(bc\), or in any other direction towards the outer face, we shall have the uplifting and overturning pressure due to the full depth of water in the reservoir over the width \(ab\) added to the horizontal pressure, in which case all our previous calculations would be futile. The condition, therefore, that there shall be no tension is an element of design; but when we come to construction, we must be careful also that no part of the wall shall be less permeable than the water face, and in fig. 14 we have seen that the varying depth of the area \(bjfc\) approximately represents the varying distribution of the vertical stress. If, therefore, the centre of that became so far removed to the right as to make \(j\) coincident with \(s\), the diagram of forces would become the triangle \(Jfc\), and the vertical pressure at the inner face would be nil. This will evidently happen when the centre of pressure \(j\) is two-thirds from the inner toe \(b\) and one-third from the outer toe \(c\); and if we displace the diagram of forces still further to the right, the condition that the centre of the figure of the diagram shall be vertically under that centre of pressure can only be fulfilled by allowing the point \(j\) to cross the horizontal line \(bc\), and the vertical pressure will be nil.

Hence it follows that on the assumption of uniformly varying stress the line of pressures, when the reservoir is full, should not at any horizontal plane fall outside the middle third of the width of that plane. Rankine in his report adopted the prudent course of taking as the safe limits certain pressures to which, at that time, such structures would be subjected. Thus for the inner face he took, as the limiting vertical pressure, 320 ft. of water, or nearly 9 tons per sq. ft., and on the face 250 ft. of water, or about 7 tons per sq. ft.
Fig. 15. Diagrams illustrating results of Wilson and Gour's experiments on an indiarubber model dam. Reservoir full.

The two systems of lines mutually at right angles show the directions of the maximum and minimum stresses, respectively. Such stresses are termed principal stresses. Tension is indicated by broken lines and compression by full lines.

The shearing stresses are zero along the lines of principal stress and reach a maximum on lines at 45° thereto. The magnitudes of the maximum and minimum shearing stresses are connected by algebraic differences of the thicknesses of the lines of principal stress.

Line $a b$ is in such a position that the stresses along and above it are not materially affected by the more irregular stresses below that line produced by the sudden change in section at the base of the dam. The vertical distance above the line $a b$ of any point in the dotted line $d e$ is proportional to the vertical component of the compressive stress on the line $d e$ assumed to vary uniformly from line to line and similarly the vertical distance of any point in the dot-and-dash line as above the line $a b$ is proportional to the horizontal component of the stress determined experimentally. The vertical component diagrams $o b$ and $o e$ are drawn to a larger scale than the lines indicating the principal stresses.

It is obvious that experiments of the kind referred to cannot take into account all the conditions of the problem met with in actual practice, such as the effect of the rock at the sides of the valley and variations of temperature, &c., but deviations in practice from the conditions which mathematical analyses or experiments assume are nearly always present. Such analyses and experiments are not on that account the less important and useful.

So far we have only considered water-pressure against the reservoir side of the dam; but it sometimes happens that the water and earth pressure against the outer face is considerable enough to modify the lower part of the section. In dams of moderate height above the ground and considerable depth below ground there is, moreover, no reason why advantage should not be taken of the earth resistance due either to the downstream face of the trench against which the foundations are built, or to the materials excavated and properly embanked against that face above the ground level or to both. We do not always know the least resistance which it is safe to give to a retaining wall subject to the pressure of earth, or conversely; the maximum resistance to side-threat which natural or embanked earth will afford, because we wisely neglect the important but very variable element of adhesion between the particles. It is notorious among engineers that retaining walls designed in accordance with the well-known theory of conjugate pressures in earth are unnecessarily strong, and this arises mainly from the assumption that the earth is merely a loose granular mass without any such adhesion. As a result of this theory, in the case of a normal retaining wall supporting a vertical face of earth beneath an extended horizontal plane level with the top of the wall, we get

$$P = \frac{2}{a} \cdot \sin \phi \cdot \frac{1 - \sin \phi}{2}$$

2 Engineering (May 12th, 1905).
where $P$ is the horizontal pressure of the earth against the wall exerted at one-third its height, $w$ the weight of unit volume of the material, $x$ the height of the wall, and $\phi$ the angle of repose of the material. That the pressure so given exceeds the maximum possible pressure we do not doubt; and, conversely, if we put

$$P' = \frac{wx^2}{2} \left( 1 + \frac{\sin \phi}{1 - \sin \phi} \right)$$

we may have equal confidence that $P'$ will be less than the maximum pressure which, if exerted by the wall against the earth, will be borne without disturbance. But like every pure theory the principles of conjugate pressures in earth may lead to danger if not applied with due consideration for the angle of repose of the material, the modifications brought about by the limited width of artificial embankments, the possible contraction away from the masonry, of clayey materials during dry weather for some feet in depth and the tendency of surface waters to produce scour between the wall and the embankment. Both the Neuadd and the Fisher Farm dams are largely dependent upon the support of earthen embankments with much economy and with perfectly satisfactory results.

In the construction of the Vyrnwy masonry dam Portland cement concrete was used in the joints. When more than six months old, 9 in. cubes of this material never failed under compression below 111 tons per sq. ft. with an average of 167 tons; and the mean resistance of all the blocks tested between two and three years after moulding exceeded 215 tons per sq. ft., while blocks cut from the concrete of the dam gave from 181 to 219 tons per sq. ft. It has been shown that the best hydraulic lime, or volcanic puzzolana and lime, if properly ground while slaking, and otherwise treated in the best-known manner, as well as some of the so-called natural (calcareous) cements, will yield results certainly not inferior to those obtained from Portland cement. The only objection that can in any case be urged against most of the natural products is that a longer time is required for induration; but in the case of masonry dams sufficient time necessarily passes before any load, beyond that of the very gradually increasing masonry, is brought upon the structure. The result of using properly treated natural limes is not to be judged from the careless manner in which such limes have often been used in the past. Any stone of which it is desirable to build a masonry dam would certainly possess an average strength at least as great as the above figures for concrete; the clay slate of the Lower Silurian formation, used in the case of the Vyrnwy dam, had an ultimate crushing strength of from 700 to 1000 tons per sq. ft. If, therefore, with such materials the work is well done, and is not subsequently liable to be wasted or disintegrated by expansion or contraction or other actions which in the process of time affect all exposed surfaces, it is clear that 15 to 20 tons per sq. ft. must be a perfectly safe load. There are many structures at present in existence bearing considerably greater loads than this, and the granite ashray masonry of at least one, the Bear Valley dam in California, is subject to compressive stresses, reaching, when the reservoir is full, at least 40 to 50 tons per sq. ft., while certain brickwork linings in mining shafts are subject to very high circumferential stresses, due to known water-pressures. In one case which has been investigated this circumferential pressure exceeds 26 tons per sq. ft., and the brickwork, which is 18 in. thick and 20 ft. internal diameter, is perfectly sound and water-tight. In portions of the structure liable to important changes of pressure from the rise and fall of the water and subject to the additional stresses which expansion and contraction by changes of temperature and of moisture induce, and in view of the great difficulty of securing that the average modulus of elasticity in all parts of the structure shall be approximately the same, it is probably desirable to limit the calculated load upon any external work, even of the best kind, to 15 or 20 tons per sq. ft. It is clear that the material upon which any high masonry dam is founded must also have a large factor of safety against crushing under the greatest load that the dam can impose upon it, and this consideration unfit any site for the construction of a masonry dam where sound rock, or at least a material equal in strength to the strongest shale, cannot be had; even in the case of such a material as shale the foundation must be well below the ground.
The actual construction of successful masonry dams has varied from the roughest rubble masonry to ashlar work. It is probable, however, that, all things considered, random rubble in which the flattest side of each block of stone is dressed to a fairly uniform surface, so that it may be laid as it were upon its edge, secures the true masonry approach to uniform elasticity. Such stones may be of any size subject to each of them covering only a small proportion of the width of the structure (in the Vyrnwy dam they reached 8 or 10 tons each), and the spaces between them, where large enough, must be similarly built in with smaller, but always the largest possible, stones; spaces too small for this treatment must be filled and rammed with concrete. All stones must be beaten down into their beds until the mortar squeezes up into the joints around them. The faces of the work may be of squared masonry, though these may be pointed; but, in the case of the expansion and contraction mentioned below, it is better that the face masonry should not be coursed. Generally speaking, in the excavations for the foundations springs are met with; these may be only sufficient to indicate a continuous dampness at certain beds or joints of the rock, but all such places should be connected by relief drains carried to visible points at the back of the dam. It should be impossible, in short, for any part of the rock beneath the dam to become charged with water under pressure, either directly from the water in the reservoir or from higher places in the mountain sides. For similar reasons care must be taken to ensure that the structure of the face of the dam shall be the least permeable of any part. In the best examples this has been secured by bedding the stones near to the water face in somewhat finer mortar than the rest, and sometimes by placing pads to fill the joints for several inches from the water face, so that the mortar was kept away from the face and was well held up to its work. On the removal of the pads, or the cutting out of the face of the mortar where pads were not used, the vacant joint was gradually filled with almost dry mortar, a hammer and caulking tool being used to compact it. If the water face is not impermeable, it is advisable to obtain. If the pores of the water face are thus rendered extremely fine, the surface water, carrying more or less fine detritus and organic matter, will soon close them entirely and assist in making that face the least permeable portion of the structure.

But no care in construction can prevent the compression of the mass as the superincumbent weight comes upon it. Any given yard of height measured during construction, or at any time after construction, will be less than a yard when additional weight has been placed upon it. As the ends of such a dam are placed against rock surfaces must move with respect to those surfaces when the superincumbent load comes upon them. This action is obviously much reduced where the rock sides of the valley rise slowly; but in cases where the rock is very steep, the safest course is to face the facts, and not to depend for water-tightness upon the cementing of the masonry to the rock, but rather to provide a vertical key, or dowel joint, of some material like asphalt, which will always remain water-tight. So far as the writer has been able to observe or ascertain, there are very few dams in America which have not been cracked transversely in their higher parts. They generally leak a little near the junction with the rock, and at some other joints in intermediate positions. It is necessary that the Neudd dam this difficulty was met by deliberately omitting the mortar in transverse joints at regular intervals near the top of the dam, except just at their faces, where it of course cracks harmlessly, and by filling the rest with asphalt. Serious movement from expansion and contraction does not usually extend to levels which are kept moderately damp, or to the greater masses of the dam, many feet below high-water level.

The first masonry dam of importance constructed in Great Britain was that on the river Vyrnwy, a tributary of the Severn, in connection with the Liverpool water-supply (Plate 1). Its height, subject to water-pressure, is about 134 ft., and a carriage-way is carried on arches at an elevation of about 18 ft. higher. As this dam is about 1180 ft. in length from rock to rock, it receives practically no support from the sides of the valley. Its construction drew much attention to the subject of masonry dams in England—where the earthen dam, with a wall of puddled clay, had hitherto been almost universal—and since its completion nine more masonry dams of smaller size have been completed. In connexion with the Elan and Claerwen works, in Mid-Wales, for the supply of Birmingham, six masonry dams were projected, three of which are completed, including the Caban Coch dam, 590 ft. long at the water level, and subject to a water-pressure of 152 ft. above the rock foundations and of 122 ft. above the river bed, the Craig-y-balt Coch dam subject to a head of 133 ft. The latter dam is curved in plan, the radius being 710 ft. and the chord of the arc 515 ft. In the Dervent Valley scheme, in connexion with the water supplies of Derby, Leicestershire, Nottingham and Sheffield, six more masonry dams have received parliamentary sanction. Of these the highest is the Haggle, on the Ashop, a tributary of the Dervent, which will impound water about 136 ft. above the river bed, the length from rock to rock being 980 ft. Two of these dams are now in course of construction, one of which, the Howden, will be 1080 ft. in length and will impound water to a depth of 114 ft. above the river bed. In 1892 the excavation was begun for the foundations of a masonry dam across the Croton river, in connexion with the supply of New York. The length of this dam from rock to rock at the overflow level is about 1500 ft. The water face, over the maximum depth at which dam cuts the rock foundations, is subject to a water-pressure of about 260 ft., while the height of the dam above the river bed is 165 ft. The section, shown in fig. 17, has been well considered. The masonry is of rubble masonry, and the faces are coursed ashlar.

So-called "natural cement" has been used, except during frosty weather, when Portland cement was substituted on account of its more rapid setting. An important feature in connexion with this is the provision for the allowing of the masonry to be constructed in such a manner that the masonry dam is the nature of the foundation upon which it stands. Part of the rock is schist, but the greater portion limestone, similar in physical qualities to the Carboniferous limestone of Great Britain. The lowest part of the surface of this rock was reached after excavating through alluvial deposits to a depth of about 70 ft., but owing to its fissured and cavernous nature it became necessary to excavate to much greater depths, reaching in places more than 120 ft. below the original bottom of the valley. Great pains appear to have been taken to ascertain that the cavernous portions of the rock had been cut out and built upon before the building was begun. The foundations, dam, already referred to as the easiest part of a scientifically designed structure of the kind, is subject to a pressure of about 166 ft. of water; the valley it crosses is only about 300 ft. wide at the water level, and the dam is curved in plan to a radius of 828 ft. Much discussion has taken place as to the utility of such curvature. The recent investigations already referred to indicate the desirability of curving dams in plan in order to reduce the possibility of tension and inflation of water at the upstream face. It is not necessary to go into the extremely interesting and complex problems relating to the combined action of horizontal and vertical stresses arise, and in some such cases it is evident that much may be done by means of horizontal curvature to reduce the quantity of masonry without reduction of strength. The Bear valley dam, California, is the most
THE VYRNWY VALLEY, MONTGOMERYSHIRE, June 1888.

LAKE VYRNWY, December 1889.
daring example in existence of the employment of the arch principle. Its height from the rock bed is 64 ft., and it is subject during floods to 3 ft. of water not much less. The length of the chord of the arch across the valley is about 250 ft. and the radius 335 ft. The dam was begun in 1883, with a base 20 ft. thick, narrowing to 13 ft. at a height of 16 ft. The cost of this thickness being regarded as too great, it was abruptly reduced to 8 ft. 6 in., and for the remaining 48 ft. it was tapered up to a final width of about 3 ft. The masonry is described by Mr. Schuyler as "a rough uncut granite ashlar, with a hearting of rough rubble all laid in cement mortar and gravel." This dam has been in satisfactory use since 1883, and the slight filtration through the masonry which occurred at first is said to have almost entirely ceased.

In New South Wales thirteen thin concrete dams, dependent upon horizontal curvature for their resistance to water pressure, have been constructed in narrow gorges at comparatively small cost to impound water for the use of villages. The depth of water varies from 18 ft. to 76 ft., and five of them have cracked vertically, owing apparently to the impossibility of the base of the dam partaking of the changes of curvature induced by changes of temperature and of moisture in the upper parts. It is stated, however, that these cracks close up and become practically water-tight as the water rises.

Something has been said of the failures of earthen dams. Many masonry dams have also failed, but, speaking generally, we know less of the causes which have led to such failures. The examination of one case, however, namely, the bursting in 1895 of the Bouzey dam, near Epinal, in France, by which many lives were lost, has brought out several points of great interest. It is probably the only instance in which a masonry dam has slipped upon its foundations, and also the only case in which a masonry dam has actually overturned, while curiously enough there is every probability that the two circumstances had no connexion with each other. A short time after the occurrence of the catastrophe the dam was visited by Dr. W. C. Unwin, F.R.S., and the writer, and a very careful examination of the work was made by them. Some of the blocks of rubble masonry carried down the stream weighed several hundred tons. The original section of the dam is shown by the continuous thick line in fig. 18, from which it appears that the work was subjected to a pressure of only about 65 ft. of water. In the year 1884 a length of 450 ft. of the dam, out of a total length of 1705 ft., slipped upon its foundations and was overthrown. A similar event, as shown at a, b, fig. 19, the maximum movement from the original straight line being about 1 ft. Further sliding on the base was prevented by the construction of the cross-lined portions in the section (fig. 18). These precautions were perfectly effective in securing the safety of the dam up to the height to which the counterfort was carried. As a consequence of this horizontal bending of the dam the vertical cracks shown in fig. 19 appeared and were repaired. Eleven years after this, and about fifteen years after the dam was first brought into use, it overturned on its outer edge, at about the level indicated by the dots in fig. 19, and it is not without good reason to attribute to the movement of 1884, or to the vertical cracks it caused, any influence in the overturning of 1895.

Some of the worst cases of slipping have, indeed, entirely beyond the portion overturned, which consisted of the mass 570 ft. long by 5 ft. in depth, and weighing about 20,000 tons, shown in elevation in fig. 19. The line of pressures as generally given for this dam with the reservoir full, on the hypothesis that the density of the masonry was a little over 2, is shown by long dashes in fig. 18. The latter was computed according to the density assumed at from 1 to 1 ton per square foot. This, if the dam had been thoroughly well constructed, either with hydraulic lime or Portland cement mortar, would have been easily borne. The materials, however, were poor, and it is probable that rupture by tension in a roughly horizontal plane took place. Directly this occurred, the front part of the wall was subject to an additional overturning pressure of about 35 ft. of water acting upwards, equivalent to about a ton per square foot, which would certainly, if it occurred throughout any considerable length of the dam, have immediately overturned it. But, as a matter of fact, the dam actually stood for about fifteen years. Of this circumstance there are two possible explanations. It is known that more or less leakage took place through the dam, and to moderate this the water face was from time to time coated and repaired with cement. Any cracks were thus, no doubt, temporarily closed; and as the structure of the rest of the dam was porous, no opportunity was given for the percolating water to accumulate in the horizontal fissures to anything like the head in the reservoir. But in reservoir work such coatings are not to be trusted, and a single horizontal crack might admit sufficient water to cause an uplift. Then, again, it must be remembered that although the full consequences of the facts described might arise in a section of the dam 1 ft. thick (if that section were entirely isolated), they could not arise throughout the length unless the adjoining sections were subject to like conditions. Any horizontal fissure in a weak place would, in the nature of things, strike somewhere a stronger place, and the final failure would be deferred. Time would then become an element. By reason of the constantly changing temperatures which a section of the reservoir is exposed to, the reservoir, expansion and contraction, which are always at work tending to produce relative movements wherever one portion of a structure is weaker than another, must have assisted the water-pressure in the generation of the horizontal cracks, which, growing slowly during the fifteen years, provided at last the area required to enable the intrusive water to overbalance the little remaining stability of the dam.

**RESERVOIRS**

From very ancient times in India, Ceylon and elsewhere, reservoirs of great area, but generally of small depth, have been built and used for the purposes of irrigation; and in modern times, especially in India and America, comparatively shallow reservoirs have been constructed of much greater area, and in some cases of greater capacity, than any in the United Kingdom.
WATER SUPPLY

Reservoirs unsafe from this cause still exist in the United Kingdom. Where the contributory drainage area exceeds 5000 acres, the discharge of the stream which supplies the source is allowed to exceed the rate of about 300 cub. ft. per second per 1000 acres, or 1500 times the minimum dry weather flow, taken as one-fifth of a cubic foot; and if we provide against such an occasional discharge, with a proportionate maximum, at half-hourly or hourly intervals, a proper factor of safety will be allowed. But when a reservoir is placed upon a smaller area the conditions are materially changed.

The rainfall which produces, as the average of all the rainfall stations, the largest annual rainfall in any part of Great Britain, is made up of groups of rainfall of very varying intensity, falling upon different portions of that area, so that upon any section of it the intensity of the discharge will be modified. The height to which the water is permitted to rise above the sill of the overflow depends upon the height of the embankment above that level (in the United Kingdom commonly 6 or 7 ft.), and this again is governed by the coefficient of permeability, which in open places that height is seldom more than about one and a half times the square root of the "fetch" or greatest distance in nautical miles from which the wave has travelled to the point in question; but in narrow reaches or lakes it is relatively higher. In lengths not exceeding about 2 m., twice this height may be reached, giving for a 2-mile "fetch" about 3½ ft., or 1½ ft. above the mean level. Above of a weir, the height of the wave should be allowed for, making the embankment in such a case not less than 5½ ft. above the highest water-level. If, then, we determine that the depth of overflow shall not exceed 1½ ft. we arrive at 6½ ft. as sufficient for the purpose. In the case of a weir of 6½ ft. height we may shorten the sill at the cost of extra height of embankment, but it is rarely wise to do so.

The overflow sill or weir, the shape might be a square or rounded vertical section raised a foot or more above the waste-water course, in which case for a depth of 1½ ft. it will discharge, over every foot of length, about 6 cub. ft. per second. Thus, if the drainage area exceeds 5000 acres, and we provide for the passage of 300 cub. ft. per second per 1000 acres, such a weir will be 50 ft. long for every 1000 acres. But, as smaller areas are approached, the excessive local rainfalls of short duration must be provided for, and beyond these points works of very different character are needed. If, for instance, there is no record of any event before any exact records can be made; hence we know very little of them beyond the bare fact that from 1000 acres the discharge may rise to two or three times 300 cub. ft. per second per 1000 acres. In such cases it is necessary to assume that the maximum rainfall which has ever been recorded is that which is to be met with, and the case must be compared with a rainfall of 1000 ft. per hour, or with a mountain area of 1000 acres, the rate per 1000 was for a short time certainly not less than 1000 cub. ft. per second. Nothing but long observation and experience can help the hydraulic engineer judge of the configuration of the ground favourable to such phenomena. It is only necessary, however, to provide for these exceptional discharges during very short periods, so that the rise in the water-level may be taken into consideration; but subject to this provision must be made at the bye-wash for preventing such a flood, however rare, from filling the reservoir to a dangerous height.

From the overflow sill the bye-wash channel may be gradually narrowing, and then the stream may find its way to the river being prevented from attaining undue velocity by steps of heavy masonry, or, where the gradient is not very steep, by irregularly set masonry.

PURIFICATION

When surface waters began to be used for potable purposes, some mode of arresting suspended matter, whether living or dead, became necessary. In many cases guaze strainers were at first employed, and, as an improvement, or addition to these, the water was caused to pass through a bed of gravel or sand, which, like the guaze, was regarded merely as a strainer. As such strainers were further improved, by sorting the sand and gravel, and using the fine sand only at the surface, better clarification of the water was obtained; but chemical analysis indicated, or was at the time thought to indicate, that that improvement was practically confined to clarification, as the dissolved impurities in the water were certainly very little changed. Hence such filter beds, as they were then called, were regarded as necessary to some extent, and the necessity was thus indicated that, notwithstanding the absence of chemical improvement in the water, changes did take place of a most important kind. Following upon Dr Koch's discovery of a method of isolating bacteria, and of making approximate determinations of their number in any volume of water, a most remarkable diminution in the number of microbes contained in sand-filtered water was observed; and it is now well known that when a properly constructed sand-filter bed is in its best condition, and is worked in the best-known manner, nearly the whole of the microbes
existing in the crude water will be arrested. The sand, which is nominally the filter, has interstices about thirty times as wide as the largest dimensions of the larger microbes; and the reason why these, and, still more, why organisms which were individually invisible under any magnifying power, and could only be detected as colonies, were arrested, was not understood. In process of time it became clear, however, that the worse the condition of a filter bed, and the then general unskillfulness of the operator the better it was as a microbe filter; that is to say, it was not until a fine film of mud and microbes had formed upon the surface of the sand that the best results were obtained.

Even yet medical science has not determined the effect upon the human system of water highly charged with bacteria which are not known to be individually pathogenic. In the case of the bacilli of typhoid and cholera, we know the direct effect, but apart altogether from the presence of such specific poisons, polluted water is undoubtedly injurious. Where, therefore, there is animal pollution of any kind, more especially where there is human pollution, generally indicated by the presence of *bacillus coli communis*, purification is of supreme importance, and no process has yet been devised which, except at extravagant cost, supersedes for public supplies that of properly-conducted sand filtration. Yet it cannot be too constantly urged that such filtration depends for its comparative perfection upon the surface film; that this surface film is not present when the filter is new, or when its materials have been recently washed; that it may be, and very often is, punctured by the actual working of the filters, or for the purpose of increasing their discharge; and that at the best it must be regarded as an temporary of defence, not to be depended upon as a safeguard against highly polluted waters, if a purer source of supply can possibly be found. Such filters are not, and in the nature of things cannot be, worked with the precision and continuity of a laboratory experiment.

In fig. 21 a section is shown of an efficient sand-filter bed. The thickness of sand is 3 ft. 6 in. In the older filters it was usual to support this sand upon small gravel resting upon larger gravel, and so on until the material was sufficiently open to pass the water laterally to under-drains. But a much shallower and certainly not less efficient filter can be constructed by utilizing the interstices of the sand under-drains cover the whole bottom. In fig. 21 the sand rests on small gravel of such a size that the water percolates slowly through the sand, and so that the whole of the grains would be retained on a sieve of 2 in. mesh, or 20 mesh. The filter is covered by a sieve of 3-in. mesh in the clear, supported upon a 3-in. thickness of bricks laid close together, and constituting the roof of the under-drains, which are formed by other bricks laid on this asphalt upon a concrete floor. In this arrangement the whole of the materials may be readily removed for cleansing, and a simple automatic arrangement for the measurement of the supply to each separate filter, and for the regulation of the quantity within certain limits, is adopted, and the resistance at outflow is so arranged that not more than a certain head of water, say 2 ft., can under any circumstances come upon the surface film, while a depth of several feet of water is maintained over the sand. This is a mass of material through which the water should be so supplied that it will not disturb the surface of the sand. When a filter has been emptied, and is being re-charged, the water should be introduced from a neighbouring filter, and should pass upwards in the filter to be charged, until the sand has been covered. The unfiltered water may then be allowed to flow quietly and to fill the space above the sand to a depth of 2 or 3 ft. It would appear to be impossible with any water that requires filtration to secure that the first filtrate is not impervious, but that it begins immediately after a filter is charged; and if the highest results are to be obtained, either the unfiltered water must be permitted to pass extremely slowly over the surface of the sand without passing through it, or to stand upon the sand until the surface film has formed. With waters giving little or no sediment, which are often among the best dangers of water supply, it is often inexpedient to allow the filter to act slowly until the surface film is formed, and to discard the first effluent. This course can scarcely fail to introduce into the sand much gravel, which is often the very essence of the process, and the quality of the filter is impaired; and it should not, therefore, be adopted when the source of the supply is known to be subject to human pollution. Then, too, the formation of a surface film upon the sand changes the quality of the raw water, from a few hours to a few days. Judging from the best observations that have been made on a large scale, the highest rate of efficient filtration when the surface film is in good condition is about 4 ft. 3 in. down per hour of the water if the height of the filter is a foot above the sand, equivalent to about 50 gallons per day per square foot of sand. When the surface film has once been formed, and the filter has begun its work, it should continue without interruption as the resistance to filtration becomes more imperceptible, and the necessary quantity of water being passed. That period will vary, according to the condition of the water, from eight or ten days to four weeks. The surface film, together with half an inch of the sand, is then carefully scraped off and stored for subsequent washing and use. This process may be repeated many times until the thickness of the fine sand is reduced to about 1 in., when the filter bed should be restored to its full thickness.

A lately discovered effect of sand filtration is a matter of great importance in connexion with the subject of aqueducts. A brown slimy sediment, having the appearance of coffee grounds when placed upon water, being water, and has been observed in surface waters from mountain moorlands. The deposit grows on the sides of the pipes and accumulates at the bottom, and causes much obstruction, though the presence of its physiologic effects of disease, bacteriologists do not appear to have finally determined the true nature and origin of this growth, but it is found in the impounded waters, and passes into the pipes, where it rapidly increases. It is checked by fine copper wire-cloth strainers, and when the water passes through sand-filter beds in the course of an aqueduct, the growth, though very great between the reservoir and the filter beds, is quite absent from the sand-filter beds and the town. In the growth of the well-known nodular incrustations in iron pipes is much reduced by sand filtration. From these facts it is clear that, other things being the same, the best position for the strainers and filters is as close as possible to the town.

Some water-supplies dissolve lead when bright, but cease to do so when the lead becomes tarnished. More rarely the action is continuous, and the water after being passed through lead cisterns and is a product of this process, is called "plumism." The liability to this appears to be entirely removed by efficient sand filtration.

Sand filtration, even when working in the best possible manner, fails short of the perfection necessary to prevent the passage of bacteria which may multiply after the filter is passed. Small, however, as the micro-organisms are, they are larger than the interstices of the sand, and by being pushed into the sand by pressure may be caused to percolate. It is therefore natural that attempts should have been made to construct filters which, while permitting the slow percolation of water, should preclude the passage of bacteria of any size. In this manner the American engineers are probably the first which successfully accomplished this object was produced. In this apparatus, known as the Pasteur-Chamberland-Berkeley filter, constructed of baked insufiorial earth. Both these filters arrest the organisms by purely mechanical action, and if the joints are water-tight and they have proper attention and frequent sterilization, they both give satisfactory results on a small scale for domestic purposes. The cost, however—to say nothing of the uncertainty—where large volumes of water are concerned, much exceeds the cost of obtaining initially safe water. Moreover, if a natural water is so liable to pathogenic pollution as to demand filtration of this kind, it ought at once to be discarded for an initially pure supply; not necessarily pure in an apparent or even in a chemical sense, but essentially uninfected by the several considerations both of organic and inorganic impurity, and yet be tasteless and free from pathogenic pollution.

There are several materials now in use possessing remarkable power to decolorize clarity, chemically purify and oxidize water; but they are too costly for use in connexion with public water supplies unless a rate of filtration is adopted quite inconsistent with the use of a surface filter for the destruction of micro-ororganisms. This fact does not render them less useful when applied to the arts in which they are successfully employed.

Attempts have been made, by adding certain coagulants to the water, to enable the separation of the coarse matter, and thus form a material to arrest bacteria when passing through them at much higher velocities than are possible for successful filtration by means of the surface film upon sand. The effect is to produce between the grains of sand a barrier of small particles of colloidal matter, formed by the mud and microbes upon the surface of the sand filter. Elsewhere centrifugal force, acting somewhat after its manner in the cream separator, has been called in aid.
The sedimentation tank forms a very important help to filtration. In the case of river waters liable to turbidity the water should always be passed through such tanks before being placed in the filters. They form, moreover, additional safeguards against organic impurity. Sedimentation tanks on a sufficient scale may effect the purification of the water to almost any desired extent. This is shown to be the case by the purity of some lake
waters; but the first cost of the works and the subsequent removal of the sediment are in some cases a serious matter, and any approach to the comparatively perfect action of lakes is out of the question. By the use of such tanks, however, when the condition of the water demands it, and by passing the effluent water through sand filters when in good condition, the number of microbes is found to be reduced by as much as 97% or even 99%. This, when attained, is undoubtedly a most
important reduction in the chance of pathogenic bacteria passing into the filtered water; but much more must be done than has hitherto in most places been done to ensure the constancy of such a condition before it can be assumed to represent the degree of safety attained. No public supply should be open to any such doubt as to whether, or may, deter people from drinking the water without previous domestic filtration or boiling.

**Distribution**

The earliest water supplies in Great Britain were generally distributed at low pressure by wooden pipes or stone or brick conduits. For special purposes the Romans introduced cast-lead pipes, but they were regarded as luxuries, not as necessary, and gave way to cheaper conduits made, as pump barrels had long been made, by boring out tree trunks, which are occasionally dug up in a good state of preservation. This use of tree-trunks as pipes is still common in the wooded mountain districts of Europe. Within the 19th century, however, cast iron became general in the case of large towns; but following the precedent inseparable from the use of cast iron, the water was often delivered under low pressure, rarely more than sufficient to supply taps or tanks near the level of the ground, and generally only for a short period out of each twenty-four hours. On the introduction of the Waterworks Clauses Act 1847, an impetus was given to high-pressure supplies, and the same systems of distributing mains were frequently employed for the purpose; but with few exceptions the water continued to be supplied intermittently, and cisterns or tanks were necessary to store it for use during the periods of intermission. Thus it happened that pipes and joints intended for a low-pressure supply were subjected only to the trying ordeal of suddenly varying pressures. As a rule such pipes were not renewed: the leakage was enormous, and the difficulty was met by the very inefficient method of reducing the period of supply still farther. But even in entirely new distributing systems the network is so extensive, and the number of joints so great, that the aggregate leakage is always considerable; the greatest loss being at the so-called "ferrules" connecting the mains with the house "communication" or "service" pipes, in the lead pipes, and in the household fittings. But a far greater evil than mere loss of water and inconvenience soon proved too insurmountable from intermittent supply. Imagine a hilly town with a high-pressure water supply, the water issuing at numerous points, sometimes only in exceedingly small veins, from the pipes into the sub-soil. In the ordinary course of intermittent supply or for the purpose of repairs, the water is cut off at some point in the main above the leakages; but this does not prevent the continuance of the discharge in the lower part of the town. In the upper part there is consequently a tendency to the formation of a vacuum, and some of the impure sub-soil water near the higher leakages is sucked into the mains, to be mixed with the supply when next turned on. We are indebted to the Local Government Board for having traced to such causes certain epidemics of typhoid, and there can be no manner of doubt that the evil has been very general. It is therefore of supreme importance that the pressure should be constantly maintained, and to that end, in the best-managed waterworks the supply is not now cut off even for the purpose of connecting house-service pipes, an apparatus being employed by which this is done under pressure. Constant pressure being granted, constant leakage is inevitable, and being constant it is not surprising that its total amount often exceeds the aggregate of the much greater, but shorter, draughts of water taken for various household purposes. There is therefore, even in the best cases, a wide field for the conservation and utilization of water hitherto entirely wasted.

Following upon the passing of the Waterworks Clauses Act 1847, a constant supply was attempted in many towns, with the result in some cases that, owing to the enormous arising loss from the prolongation of the period of leakage from a fraction of an hour to twenty-four hours, it was impossible to maintain the supply. Accordingly, in some places large sections of the mains and service pipes were entirely renewed, and the water consumers were put to great expense in changing their fittings to new and no doubt better types, though the old fittings were only in a fraction of the cases actually causing leakage. But whether or not such stringent methods were adopted, it was found necessary to organize a system of house-to-house visitation and constantly recurring inspection. In Manchester this was combined with a most careful examination, at a depot of the Corporation, of all fittings which were to be used. The search was extended to those fittings, and only those which complied in every respect with the prescribed regulations were stamped and permitted to be fixed within the limits of the water supply. But this did not obviate the necessity for house-to-house inspection, and although the number of different points at which leakage occurred was still great, it was always small in relation to the number of houses which were necessarily entered by the inspector; moreover, when the best had been done that possibly could be done to suppress leakage due to leakage due to defective fittings, the water was in the habit of lying below ground in the mains, ferrules and service pipes still remained, and leaks were thus made inevitable. It was clear, therefore, that in its very nature, house-to-house visitation was both wasteful and insufficient, and it remained for Liverpool to correct the difficulty by the application, in 1857, of the "Differentiating waste water meter," which has since been extensively used for the same purpose in various countries. One such instrument was placed below the roadway upon each main supplying a population of generally between 1000 and 2000 persons.

Its action is based upon the following considerations: When water is passing through a main and supplying nothing but leakage and not subject to anything that would solubly dissolve it before reaching the test, the rate of flow is immediately uniform, and any instrument which graphically represents the flow always affects the mind a full conception of the nature of the flow, and by the position of that line between the bottom and the top of a diagram the quantity of water (in gallons per hour, for example) is recorded. We have a full statement, not only of the rate of flow, but of its nature. We know, in short, that the water is not being usefully employed. In the actual instrument, the paper diagram is mounted upon a drum caused by clockwork to revolve uniformly, and is ruled with vertical hour lines, and horizontal quantity lines representing gallons per hour. Thus, while nothing but leakage occurs the uniform portion of the line is in a horizontal position. If the main is opened in any house connected with the main, the change of flow will be represented by a vertical change of position of the horizontal line, and when the tap is turned off the pencil will resume its original horizontal position, but the rate of change of the flow will be indicated by a clock over the interval during which the tap was left open. If, on the other hand, water is suddenly drawn off from a cistern supplied through a ball-cock, the flow through the ball-cock will be recorded, and will be represented by a sudden rise to a maximum, followed by a gradual decrease as the ball rises and the cistern fills; the result being a curve having its asymptote in the original horizontal line. Now, all the uses of water, of whatever kind they may be, produce some such irregular diagrams as these, which can never be confused with the uniform horizontal line of leakage, but are always superimposed upon it. It is this leakage line that the waterworks engineer wishes to ascertain the truth as to the leakage and then to put an end to it. In well-equipped waterworks each house service pipe is controlled by a stop-cock accessible from the footpath to the officials of the water authority, and the process of waste detection by inspection is a continuous one, and the amount dependent upon the inspection in conjunction with the differentiating meter. As an example of one mode of applying the system, suppose that a night inspector begins work at 11.30 p.m. in a certain district of 2000 persons, the meter of which records at the time a uniform flow of 2000 gallons an hour, showing the not uncommon rate of leakage of 24 gallons per head per day. The inspector proceeds along the footpath from house to house, and at each house, after noting the number of each house the exact time of each such operation. Having arrived at the end of the district he retraces his steps, noting, as he goes, the whole of such transactions. The meter takes it to the night complaint office, and enters the "night inspection book" the records he has made. The next morning the diagram and the "night inspection book" are in the hands of the inspector. Now, the inspector, who comes upon the diagram that the initial leakage of 2000 gallons an hour has in the course of a 48 hours' night inspection fallen to 400 gallons an hour, and that the 1600 gallons an hour is accounted for by
fifteen distinct drops of different amounts and at different times. Each drop is then located by the time and place records in the book and the time records on the diagram as belonging to a particular service pipe; so that out of possibly 300 premises the bulk of the leakage has been discovered. This gives the inspector the knowledge that a portion of the total leakage of 2000 gallons an hour is almost certainly there, and that it must be found, which is a very different thing from visiting three or four houses in one district. In some cases, where such a system of localization, the leakage might go on for years or for ever. There are many and obvious variations of the system. The leakage is generally discovered in a night. Sometimes, however, the time scale will be too close; but the ordinary diagram revolving once in 24 hours is usually quite effective in night inspections by only closing those stop-cocks which are actually passing water. This method was also first introduced in Liverpool.

The night inspector carries with him a stethoscope, often consisting merely of his steel turning-rod, with which he sounds the whole of the outside stop-cocks, but only closes those through which the sound of water is heard. An experienced man, or even a boy, if selected as possessing the necessary faculty (which is sometimes very strongly marked), can detect the smallest dribble when the stop- cocks are closed. Similar experiments may be made by means of the stop-valves on the mains are also made, and it often happens that the residual leakage (400 gallons an hour in the last case) recorded on the diagram, but not shut off by the house stop-cocks, can be heard. The leakage is localized as having been heard at a stop-cock and traced by sounding the pavement to a particular position under a particular street.

All leakages found on private property are duly notified to the tenant in the usual way, and all determinations of the time taken to ascertain if such notices have been attended to. If this work is properly organized, nearly the whole of the leakage so detected is found to be within the tenants' premises. In the case of the so-called "night readings" in a large town is most interesting and instructive. If, for example, in the case of a hundred such districts we watch the result of leaving them alone, a gradual growth of leakage occurs and the district is divided into the district while here and there a sudden increase occurs, often doubling or trebling the total supply to the district. Upon the original installation, if conducted by town, the rate of leakage and consequent total supply to the different districts is found to vary greatly, and in some districts it is usually many times as great per head as in others. An obvious and fruitful extension of the method is to employ the inspectors only in those districts which, for the time being, promise the most useful results.

In many European cities the supply of water, even for domestic purposes, is given through ordinary water meters, and paid for, according to the meter reading. Meter reading is often used as a supply of gas or electricity. By the adoption of this method great reductions in the quantity of water used are occasioned. The city of Trelleborg, for example, pays for the leakage or waste he permits to take place, as well as for the water he uses. The system, however, does not assist in the detection of the leakage which inevitably occurs between the reservoirs and the meters. The reason is simple: the whole of the joints and ferrules connecting the service pipes with the mains, and the greater parts of the service pipes, are still exposed to leakage without any compensating return to the water authority. But the worst evil of the system, and one which must always prevent its introduction into the United Kingdom, is the circumstance that it treats water as an article of commerce, to be paid for according to the quantity taken. In the organization of the best and of the best of water undertakings in the United Kingdom the free use of water is encouraged, and it is only the leakage or occasional improper employment of the water that the water authority seeks, and that such use is not encouraged. The object of the meter-payment system has, in some places, been sought to be removed by providing a fixed quantity of water, assumed to be sufficient, as the supply for a fixed maximum payment, and by using the meter to record supply for the purpose of determining what additional payment, if any, becomes due from the water tenant. Clearly, if the prices are frequent, the limit must be too low; if infrequent, the punitive effect of the penalty or recompensation involved in the system is employed to very little purpose.

The question of the distribution of water, rightly considered, resolves itself into a question of delivering water to the water tenant, without leakage on the way, and of securing that the fittings employed by the water tenant shall be such as to afford an ample and ready supply at all times of the day and night without leakage and without any unnecessary facilities for waste. If these conditions are complied with, it is probable that the total rate of supply will not exceed, even if it reaches, the rate necessary in any system, not being an oppressive and insanitary system, by which the water is paid for according to the quantity used.

Waters, Territorial. In international law "territorial waters" are the belt of sea adjacent to their shores which states respect as being under their immediate territorial jurisdiction, subject only to a right of "innocent passage" through them by vessels of all nations. As to the breadth of the belt and the exact nature of this "innocent passage" of passage, however, there is still much controversy. The 3-mile limit recognized and practised by Great Britain, France and the United States seems to have been derived from the cannon range of the period, when it was adopted as between Great Britain and the United States, and also as between France and the United States, by Bynkers, a famous Dutch jurist, whose authority at one time was almost as great in England as in his own country, in a dissertation on the "Dominion of the Sea (1792)," had devised a plausible juridical theory to support a homogeneous jurisdiction over environs waters in the place of the quite arbitrary claims made at that time, to any distance seawards, from whole seas to range of vision. Starting from the fact that fortresses can give effective protection within range of their cannon, and that in practice this effective protection was respected, he argued that the respect was not due to the reality of the presence of cannon, but to the fact that the state was in a position to enforce respect. This it could do from any point along its shore. Hence his well-known doctrine: terrae dominium finitur, ubi finitur armorum vis. The doctrine satisfied a requirement of the age and became a maxim of international law throughout northern Europe, both for the protection of shore fisheries and for the assertion of the immunity of adjacent waters of neutral states from acts of war between belligerent states. Germany still holds in principle to this varying limit of cannon range. Norway has never agreed to the 3 m., maintaining that the special configuration of her coastline states the exercise of jurisdiction over a belt of 4 m.

Spain lays claim to jurisdiction over 6 m. from her shores. The writers and specialists on the subject are quite as much divided. A British Fishery Commission in 1893 reported that "the present territorial limit of 3 m. is insufficient, and that, for fishery purposes alone, this limit should be extended, provided such extension can be effected upon an international basis and with due regard to the rights and interests of all nations." The committee recommended that a proposition on these lines should be submitted to an international conference of the powers who border on the North Sea, that it would be conducted in 1881-1882, between Great Britain, France, Belgium, Holland, Germany and Denmark, relating to the regulation of the fisheries in the North Sea, which has fixed the limit of territorial waters as between the contracting parties at 3 m. measured from low-water mark and from a straight line drawn from headland to headland at the points where they are 10 m. across. In the British Act of 29th June 1893, giving effect to a subsequent convention (16th November 1882) between the same parties for the regulation of the liquor traffic in the North Sea, "territorial waters" are declared to be as defined in the Territorial Waters Jurisdiction Act 1878. In this Act the "limit to which the jurisdiction of the admirals" is extended is not restricted by the waters of Her Majesty's dominions.

The territorial waters of Her Majesty's dominions in reference to the sea means such part of the sea adjacent to the coast of the United Kingdom, or the coast of some other part of Her Majesty's dominions, as is deemed by international law to be within the territorial sovereignty of Her Majesty; and for the purpose of any offence declared by this act to be within the jurisdiction of the admirals, any part of the open sea within one marine league of the coast measured from low-water mark shall be deemed the open sea within the territorial waters of Her Majesty's dominions.

This definition only restricts the operation of the 3 m. limit to offences dealt with in the act, and does not deal with bays.

The act of 1893 declares that the articles of the convention "shall be of the same force as if they were enacted in the body of the act," but this convention gives no definition of territorial waters.

The jurisdiction exercised in British territorial waters under
the Territorial Waters Jurisdiction Act of 1878 is asserted without distinction between them and inland waters. "All offences" committed by any person, whether a British subject or not, and whether or not committed "on board or by means of a foreign ship," "within the territorial waters of Her Majesty's dominions," are made punishable under it. No exception is made for offences committed on merely passing foreign vessels, except that there is this attenuation in their case, that no prosecution can take place without a special authorization given by certain high officers of state. It is doubtful whether any Continental state would recognize so complete a jurisdiction.

The subject has been exhaustively dealt with by both the Institute of International Law and the International Law Association, which, at the suggestion of the rapporteur of the two committees, decided that the subjects of fisheries and neutrality should be dealt with separately. The following considerations and rules were adopted in 1894 by the institute and afterwards by the association:

Whereas there is no reason to confound in a single zone the distance necessary for the exercise of sovereignty and protection of coast fisheries and the distance necessary to guarantee the neutrality of non-belligerent nations in time of war; And whereas the distance most commonly adopted of 3 m. from low-water mark has been found to be insufficient for the protection of coast fisheries; And whereas, moreover, this distance does not correspond to the real range of cannon placed on the coast; The following dispositions are adopted:

Art. I. The state has the right of sovereignty over a belt of sea along its coast subject to the right of inoffensive passage reserved in article 5. This belt is called territorial waters (mer territorial). The territorial waters extend from the low-water mark (to a degree of latitude) from low-water mark along the whole extent of its coasts.

Art. III. For bays, territorial waters follow the trend of the coast except that it is measured from a straight line drawn across the bay from the two points nearest the sea where the opening of the bay is of 12 marine m. in width, unless a greater width has become recognized by an immemorial usage.

Art. V. All ships, without distinction, have the right of inoffensive passage through territorial waters, subject to the belligerent right to regulate, and for purposes of defence to bar, the passage through the said waters for every ship, and subject to the right of notification its passage through the said waters for ships of war of all nationalities.

Art. VI. Crimes and offences committed on board foreign ships passing through territorial waters shall not be punished upon persons or things on board the same ships, are, as such, beyond the jurisdiction of the adjacent state, unless they involve a violation of the rights or interests of the adjacent state, or of its subjects or citizens, or of its territory or of its passengers.

Art. VII. Ships passing through territorial waters must conform to the special rules laid down by the adjacent state, in the interest and for the security of navigation and for the police of the sea.

Art. VIII. Ships of all nationalities, by the simple fact of being in territorial waters, unless merely passing through them, are subject to the jurisdiction of the adjacent state.

The adjacent state has the right to continue upon the high seas the pursuit of a ship confined within territorial waters, and to arrest and try it for an offence committed within the limits of its waters. In case of capture on the high seas the fact shall, however, be communicated to the state by which the ship was captured.

The pursuit is interrupted from the moment the ship enters the territorial waters of its own state or of a third power. The right of pursuit ceases from the moment the ship enters a port either of its own state or of a third power.

Art. IX. The special position of ships of war and of ships assimilated to is reserved.

Art. X. The provisions of the preceding articles are applicable to straits not exceeding 12 m. in width, with the following modifications and exceptions:

(1) Straits, the coast of which belong to different powers, form part of the territorial waters of the adjacent states, their jurisdiction respectively extending to the middle line of the straits;

(2) Straits whose coasts belong to the same state, and which are not indispensable for maritime communication between two or more states other than the state in question, form part of the territorial waters of the said state whatever the proximity of the two coasts may be;

(3) Straits through which a passage between one open sea and another can never be closed.

Art. XI. The position of straits already regulated by conventions on special usage is conserved.

The Dutch government in 1896 brought these rules to the notice of the leading European governments, and suggested the desirability of concluding an international convention on the subject. The only government which was unfavourable to the proposal was that of Great Britain. (See as to the Moray Firth Fisheries controversy, NORTH SEA FISHERIES CONVENTION.)

In the Hague Convention of 1907 respecting the rights and duties of neutral powers in naval war, the existing practice in regard to territorial waters is confirmed (see arts. 3, 5, 12, 13 and 18), but no definition of what constitutes the distance of territorial waters and the limits which the said waters and those which the next Hague Conference may deal with, inasmuch as for purposes of neutrality the difficulties connected with fishery questions do not arise.

WATER-THYME, known botanically as Elodea canadensis, a small submerged water-weed, native of North America. It was introduced into Co. Down, Ireland, about 1836, and appeared in England in 1841, spreading through the country in ponds, ditches and streams, which were often choked with its rank growth. Elodea is a member of the monocotyledonous natural order Hydrocharitae (q.v.).

WATERTON, CHARLES (1782–1865), English naturalist and traveller, was born at Walton Hall, near Pontefract, Yorkshire, on the 3rd of June 1782. After being educated at the Roman Catholic college of Stonyhurst, and travelling a short time in Spain, he went to Demerara to manage some estates belonging to his family. He continued in this occupation for about eight years, when he began those wanderings upon the results of which his fame as a naturalist principally rests. In his first journey, which began in 1812, and the principal object of which was to collect the poison known as curare, he travelled through British Guiana by the Demerara and Essequibo rivers to the frontiers of Brazil, making many natural history collections and observations by the way. After spending some time in England he returned to South America in 1816, going by Pernambuco and Cayenne to British Guiana, where again he devoted his time to the most varied observations in natural history. For the third time, in 1820, he sailed from England for Demerara, and again he spent his time in similar pursuits. Another sojourn in England of about three years was followed by a visit to the United States in 1824; and, having touched at several of the West India islands, he again went on to Demerara, returning to England at the end of the year. In 1828 he published the results of his four journeys, under the title of Wanderings in South America—consisting largely of a collection of observations on the

The question of revising the limits fixed for Territorial Waters in the Hague Convention of 1899 was not considered at a conference held in Berlin in 1895. The conference was again held at a meeting of the International Fishery Protection Association in 1906, where a resolution was adopted in favour of maintaining the present 3-miles limit on grounds of expediency, which deserves serious consideration.
appearance, character and habits of many of the animals to be found in British Guiana. Waterton was a keen and accurate observer, and his descriptions are of a graphic and humorous character, rarely to be found in works on natural history. He married in 1820, and from that time lived mostly at Walton Hall, devoting himself to the improvement of his estate, to country pursuits, and to natural history observations. He also published three series of Essays in Natural History (1838, 1844, 1857). He died at Walton Hall on the 27th of May 1865, from the result of an accident. His only son, Edmund Waterton (1820-1887), was a zoologist, who published a part of some of those he collected are in the Victoria and Albert Museum.

WATERTOWN, a township of Middlesex county, Massachusetts, U.S.A., on the Charles river, about 6 m. W. of Boston. Pop. (1890) 7073; (1900) 9706, of whom 2885 were foreign-born and 53 were negroes; (1910) census 13,875. Area, 41 sq. m. Watertown is served by the Fitchburg division of the Boston & Maine railway, and is connected with Boston, Cambridge, Newton (immediately adjacent and served by the New York, New Haven & Hartford railway) and neighbouring towns by express trains and trams. It is the seat of a large and many acres are within the township. The Charles river, near the Charles river, and occupies the fertile undulating plains along the river running back to a range of hills, the highest of which are Whitney Hill (200 ft.) and Meeting House Hill (250 ft.). Within the township are several noteworthy examples of colonial architecture. There are several small parks and squares, including Central Square, Beech Square, about which the business portion of the township is centred, and Saltonstall Park, in which is a monument to the memory of Watertown's soldiers who died in the Civil War, and near which are the Town House and the Free Public Library, containing a valuable collection of 60,000 books and pamphlets and historical memorials. There are two interesting old burying-grounds: one on Grove Street, near the Cambridge line, first used in 1642, contains a monument to John Coolidge, killed during the British retreat from Concord and Lexington on the 19th of April 1775; the other is near the centre of the village about the former site of the First Parish Church. In Coolidge's Tavern (still standing) Washington was entertained on his New England tour in 1789; and in a house recently moved from Mt Auburn Street to Marshall Street by the Committee of Safety a sale is held within the township are mounds and earthworks which Professor E. N. Horsford thought were the remain of a Norse settlement in the 11th century, and which include a semicircular amphitheatre of six tiers or terraces which he thought was an assembly place, at the foot of a portion of a stone wall or dam. The Federal government maintains an arsenal at Watertown one of its principal arsenals, occupying grounds of about 200 acres along the river. Several of the original low brick buildings, built between 1816 and 1820, still stand. In 1905 the value of Watertown's factory products was $15,574,675.

Watertown was one of the earliest of the Massachusetts Bay settlements, having been begun early in 1630 by a group of settlers led by Sir Richard Saltonstall and the Rev. George Phillips. The first buildings were upon land now included within the limits of Cambridge. For the first quarter century Watertown ranked next to Boston in population and area. Since then its limits have been greatly reduced. Thrice portions have been added to Cambridge, and it has contributed territory to form the new townships of Weston (1712), Waltham (1728), and Belmont (1829). In 1632 the residents of Watertown protested against being compelled to pay a tax for the erection of a stockade fort at Cambridge; this was the first protest in America against taxation without representation and led to the establishment of representative government in the colony. As early as the close of the 17th century Watertown was the chief horse and cattle market in New England and was known for its fertile gardens and fine estates. Here about 1632 was erected the first grist mill in the colony, and in 1662 one of the first woolen mills in America was built here. In the First Parish Church, the site of which is marked by a monument, the Provincial Congress, after adjournment from Concord, met from April to July 1775; the Massachusetts General Court held its sessions here from 1775 to 1778, and the Boston town meetings were held here during the siege of Boston, when many of the well-known Boston families made their homes in the neighbourhood. For several months early in the War of Independence the Committees of Safety and Correspondence made Watertown their headquarters and it was from here that General Joseph Warren set out for Bunker Hill. In 1824-1834 Theodore Parker conducted a private school here and his name is still preserved in the Park School.

WATERTOWN, a city and the county-seat of Jefferson county, New York, U.S.A., 73 m. by rail N. of Syracuse on the Black river. Pop. (1890) 14,725; (1900) 21,666, of whom 51 were foreign-born and 75 were negroes; (1910) census 26,730. Watertown is served by the New York Central & Hudson River railway. The city has several squares and public parks, one of them, City Park, having an area of about 500 acres. Among the public buildings and institutions are the city hall, the Federal building, the county court house, a state armoury, the Flower Memorial Library (erected as a memorial to Roswell P. Flower, governor of New York in 1892-1895, by his daughter, Mrs J. B. Taylor) with 25,514 vols. in 1910, the Immaculate Heart Academy (Roman Catholic), the Jefferson County Orphan Asylum (1856), the St Patrick's Orphanage (1870; under the Sisters of St Joseph), the Henry Keep Home (1879), for aged men and women, St Joachim's Hospital (1896; under the Sisters of Mercy), and the House of the Good Samaritan (1882).

Watertown is situated in a fertile agricultural and dairying region, of which it is a distributing centre, and it ships large quantities of farm produce and dairy products (especially cheese). The Black river furnishes water-power which is utilized by manufacturing establishments of diversified character. In 1905 the city's factory products were valued at $8,371,616. Watertown was settled during the late years of the 18th century. It became the county-seat in 1805, was incorporated as a village in 1816 and was first chartered as a city in 1869.

WATERTOWN, a city of Dodge and Jefferson counties, Wisconsin, U.S.A., on both banks of the Rock river, about 45 m. W.N.W. of Milwaukee. Pop. (1890) 8775; (1900) 8437, including 2447 foreign-born; (1905, state census) 8623; (1910) 8829. Watertown is served by the Chicago & North-Western and the Chicago, Milwaukee & St Paul railways, and by an interurban electric line, connecting with Milwaukee. It is the seat of North-western University (1865; Lutheran), which includes collegiate, preparatory and academical departments, and had in 1908-1909 11 instructors and 283 students, and of the Sacred Heart College (Roman Catholic, opened in 1872 and charted in 1874), under the Congregation of the Holy Cross. There are also a Carnegie library, a Lutheran Home for the Feeble-Minded, and a City Hospital. The Rock river furnishes water-power which is utilized for manufacturing. The value of the factory product in 1905 was $2,054,487. The city is situated in a dairying and farming region. The municipality owns and operates its water the city's factory products were valued at $8,371,616. Watertown was settled about 1836 by settlers who gave it the name of their former home, Watertown, New York. Afterwards there was a great influx of Germans, particularly after the Revolution of 1848, among them being Carl Schurz, who began the practice of law here. Germans by birth or descent still constitute a majority of the population. Watertown was incorporated as a village in 1849, and was chartered as a city in 1853.

WATERVILLE, a city of Kennebec county, Maine, U.S.A., on the Kennebec river, 19 m. above Augusta. Pop. (1900)
WATERVLIET—WATSON, R.

9477, of whom 2087 were foreign-born; (1910 census) 11,458. It is served by the Wiscasset, Waterville & Farmington railway, and two lines of the Maine Central railroad. The Ticonic Falls in the river afford excellent water-power, which is used in the manufacture of cotton and woolen goods, &c. In Winslow (pop. in 1910, 2750), on the opposite side of the river and connected by bridges with Waterville, are large paper and pulp mills. Waterville has a Carnegie library and is the seat of Colby College (Baptist), which was incorporated as the Maine Literary and Theological Institution in 1813, was renamed Waterville College in 1821, was named Colby University in 1867, in honour of Gardner Colby (1810-1879), a liberal benefactor, and received its present name in 1890. Since 1871 women have been admitted on the same terms as men. In 1910 the college library contained 31,000 volumes. Waterville was settled about the middle of the 18th century. It was a part of the township of Winslow from 1771 to 1802, when it was incorporated as a separate township. It was first chartered as a city in 1883.

WATERVLIET, a city of Albany county, New York, U.S.A., on the W. bank of the Hudson river opposite Troy and about 5 m. N. of Albany. Pop. (1890) 12,967; (1900) 14,321, of whom 2754 were foreign-born and 59 were negroes; (1910 census) 15,074. Watervliet is served by the Delaware & Hudson railway and by steamboat lines on the Hudson river, and is connected with Troy by bridges and ferries, and with Albany, Troy, Cohoes and Schenectady by electric lines. The Erie and Champlain canals join the Hudson river at Watervliet; there is also a short canal from the Mill pond to the railroad depot, and a short canal to the state prison. The city is in the county seat and public school district. The city has a city hall and a public library. Watervliet is situated in a good farming country, but is chiefly a manufacturing place; in 1905 its factory products were valued at $1,884,802 (25% more than in 1900), not including the product of the United States Arsenal (1807), on the river, an important manufacturer of heavy ordnance. The place was originally called West Troy and was incorporated as a village in 1835; in 1897 it was chartered as a city under its present name; at the same time the township of Watervliet in which it was situated was divided into the townships of Colonie and Green Island. In 1776 the first settlement of Shakers (q.v.) in America was made in the township by "Mother Ann" Lee and her followers, who named it Niskayuna. Here "Mother Ann" died and is buried.

WATFORD, a market town in the Watford parliamentary division of Hertfordshire, England, 17½ m. N.W. of London by the London & North-Western railway. Pop. of urban district (1891) 17,063; (1901) 20,327. It lies on the small river Colne in a pleasant undulating and well wooded district. The church of St Mary, with embattled tower and spire, is of various dates, and contains good examples of monumental work of the early 13th century; and in the churchyard a statue of a lady, Robert Chatterton (d. 1831), author of the History and Antiquities of the County of Hertford. There are several modern churches and chapels. The chief building within the town is the Watford Public Library and School of Art. There are large breweries, also corn-mills, malt-kilns and an iron foundry. Bushey, on the south side of the Colne, lying for the most part high above it, is a suburb, chiefly residential, with a station on the North-Western line. The church of St James, extensively restored by Sir Gilbert Scott, is Early English in its oldest part, the chancel dates from 1130; the tower was added in 1490. The church was restored in 1845 under the will of Henry Herkomer, R.A., but it was closed in 1904, and subsequently revived in other hands. Other institutions are the Royal Caledonian Asylum and the London Orphan Asylum. At Aldenham, 2 m. N.E., the grammar school founded in 1590 now ranks as one of the minor English public schools.

WATKIN, SIR EDWARD WILLIAM, 1st Bt. (1810-1901), English railway manager, was born in Manchester on the 26th of September 1819. He was the son of Absalom Watkin, a merchant in Manchester, and was employed in his father's counting-house; he subsequently became a partner; but in 1845 he was appointed secretary of the Trent Valley railway, which was soon afterwards absorbed by the London & North-Western Company. He next joined the Manchester & Sheffield Company, of which he became general manager and then chairman, subsequently combining with the duties thus entailed the chairmanship of the South-Eastern (1867) and of the Metropolitan (1872). His connexion with these three railways was maintained to within a short time of his death, and they formed the material of one of his most ambitious schemes—the establishment of a through route under the management from Dover to Manchester and the north. This was the end he had in view in his successful fight for the extension of the Manchester, Sheffield & Lincolnshire railway (now the Great Central) to London; and his persistent advocacy of the Channel tunnel (q.v.) between Dover and Calais was really a further development of the same idea, for its construction would have enabled trains to be run from Paris to Lancashire and Scotland, via the East London (of which also he was for a time chairman) and the Metropolitan. The latter scheme, however, failed to obtain the necessary public and political support. Other projects had even less success. His plans for a tunnel between Shrewsbury and Ireland under the North Channel, and for a ship canal across Ireland from Galway to Dublin, did not come to anything; while the great tower at Wembley Park (near Harrow), intended to surpass the Eiffel Tower at Paris, stopped at an early stage. It was in the realms of railway politics that Watkin showed to best advantage; for the routine work of administration purely and simple he had no aptitude. He entered parliament as a Liberal, and after representing Stockport from 1864 to 1866, sat as member for Hythe for twenty-one years from 1874, becoming Speaker of the House of Commons by election in 1891. He was knighted in 1890, and subsequently acting as a "free lance." In 1868 he married a daughter of a knight and, in 1880 he was created a baronet. His death occurred at Northenden, Cheshire, on the 13th of April 1900.

WATKINS, a village and the county-seat of Schuyler county, New York, U.S.A., at the head (south end) of Seneca Lake, about 22 m. N.N.W. of Elmira. Pop. (1890) 2604; (1900) 2045; (1905) 2077; (1910) 2817. Watkins is served by the New York Central & Hudson River, the Northern Central (Pennsylvania) and the Lehigh Valley railways, by an electric line to Elmira and by a steamer line on the lake. There are mineral springs, whose waters, notably those of an iodio-bromated brine spring, are used in bath treatment for rheumatism, gout, heart, kidney and liver diseases, &c. Partly within the village limits is Watkins Glen, a narrow winding gorge about 2 m. long, with walls and precipices from 100 to 300 ft. high, through which flows a small stream, forming many falls, cascades and pools. The Glen property, about 103 acres, was opened as an excursion resort in 1863, and in 1906 was made a free state reservation or park and was placed in the custody of the American Scenic and Historic Preservation Society. About 5 m. S.E. is Havana Glen. At Watkins Glen the Erie and the Northern Central railways converge (see Watkins Glen, N.Y.). The first settlement in the country made in 1788, and Watkins was incorporated as a village in 1842.

WATLING STREET, the Early English name for the great road made by the Romans from London past St Albans (Roman Verulamium) to Wroxeter (Roman Viroconium) near Shrewsbury and used by the Anglo-Saxons, just as a great part of it is used to-day. According to early documents the name was at first Waelinga (or Watlinga) street; its derivation is unknown, but an English personal name may lie behind it. After the Conquest the road was included in the list of four Royal Roads in the Hundred of Northwold (see Euston Road, Northern Street). Later still, in the Elizabethan period and after it, the name Watling Street seems to have been applied by antiquaries to many Roman or reputed Roman roads in various parts of Britain, and English map-makers and inferior writers on Roman roads still perpetuate the fictions. In particular, the Roman "North Road" which ran from York through Corbridge and over Cheviot to Newstead near Melrose, and thence to the Wall of Pius, and which has largely been in use since Roman times, is now not unfrequently called Watling Street, though there is no old authority for it and throughout the middle ages the section of the road between the Tyne and the Forth was called Dere Street.

WATSON, RICHARD (1737-1816), English divine, was born in August 1737 at Heversham in Westmorland. His father, a
schoolmaster, sent him to Trinity College, Cambridge, where he was elected a fellow in 1760. About the same time he had the offer of the post of chaplain to the factory at Bengoolen, in the Straits Settlements. "You are too good," said the master of Trinity, "to die of drinking punch in the torrid zone;" and Watson, instead of becoming, as he had flattered himself, a great orientalist, remained at home to be elected professor of chemistry, a science of which he did not at the time possess the simplest rudiments. "I buried myself," he says, "in my laboratory, and in fourteen months read a course of chemical lectures to a very full audience." One of his discoveries led to the black-bulb thermometer. Not the least of his services was to procure an endowment for the chair, which served as a precedent in similar instances. In 1771 he was appointed regius professor of divinity, but did not entirely renounce the simplicity of chemistry. In 1768 he had published Institutiones metallurgicae, intended to give a scientific form to chemistry by digesting facts established by experiment into a connected series of propositions. In 1781 he followed this up with an introductory manual of Chemical Essays. In 1776 he answered Gibbon's chapters on Christianity, and had the honour of being one of the only two opponents whom Gibbon treated with respect. The same year he offended the court by a Whig sermon, but in 1779 became archdeacon of Ely. He had always opposed the American War, and in 1782 was made bishop of Llandaff, being permitted to retain his other preferments on account of the poverty of the see. Shelburne expected great service from him as a pamphleteer, but Watson proved from the ministerial point of view a most impracticable prelate. He immediately brought forward a scheme for improving the condition of the poorer clergy by equalizing the incomes of the bishops, the reception of which at the time may be imagined, though it was substantially the same that came into effect by Lord Melborne's government fifty years later. Watson now found that he had been too moderate. He had destroyed his chance of the great object of his ambition, promotion to a better diocese. Neglecting both his see and his professorship, to which latter he appointed a deputy described as highly incompetent, he withdrew to Calgarth Park, in his native county, where he occupied himself in forming plantations and in the improvement of agriculture. He also frequently came forward as a preacher and as a speaker in the House of Lords. His advice to the government in 1787 is said to have saved the country £100,000 a year in gunpowder. In 1796 he published, in answer to Thomas Paine, an Apology for the Bible, a lost, and so is the best known of his numerous writings. Watson continued to exert his pen with vigour, and in general to good purpose, denouncing the slave trade, advocating the union with Ireland, and offering financial suggestions to Pitt, who seems to have frequently consulted him. In 1798 he wrote to the People of Great Britain, enforcing resistance to French arms and French principles, ran through fourteen editions, but estranged him from many old friends, who accused him, probably with injustice, of aiming to make his peace with the government. Though querulous because of his non-preference, De Quincey tells us that "his lordship was a jovious, jovial, and cordial host." He died on the 2nd of July 1816, having occupied his latter years in the composition and revision of an autobiography (published in 1817), which, with all its egotism and partiality, is a valuable work, and the chief authority for his life.

WATSON, THOMAS (c. 1557-1592), English lyrical poet, was born in London, probably in 1557. He proceeded to Oxford, and while quite a young man enjoyed a certain reputation, even abroad, as a Latin poet. He first published "De remedia amoris," which was perhaps his earliest important work, in 1580, and on the occasion of his "piece of work written in the commendation of woman-kind," which was also in Latin verse. He came back to London and became a law-student. The earliest publication by Watson which has survived is a Latin version of the Antigone of Sophocles, issued in 1581. It is dedicated to Philip Howard, earl of Arundel, who was perhaps the patron of the poet, who seems to have spent some part of this year in Paris. Next year Watson appears for the first time as an English poet in some verses prefixed to Whetstone's Heptameron, and also in a far more important guise, as the author of the Examenum or Essay, a collection of 200 pieces, in the manner of Petrarch, celebrating the sufferings of a lover and his long farewell to love. The technical peculiarity of these interesting poems is that, although they appear and profess to be sonnets, they are really written in triple sets of common six-line stanzas, and therefore have eighteen lines each. It seems likely that Watson, who courted comparison with Petrarch, seriously desired to recommend this form to future sonneteers; but in this he had no imitators. Among those who were at this time the friends of Watson we note Matthew Royden and George Vertue. The essay, as a piece of light and easy reading, is an admirable play of Aminta, and his version was afterwards translated into English by Abraham Fraunce (1587). Watson was now, as the testimony of Nashe and others prove, regarded as the best Latin poet of England. In 1590 he published, in English and Latin verse, his Meliboeus, an elegy on the death of Sir Francis Walsingham, and a collection of Italian Madrigals, put into English by Watson and set to music by Byrd. Of the remainder of Watson's career nothing is known, save that on the 26th of September 1592 he was buried in the church of St Margaret, Westminster, where, the poet tells his son, he died a happy and good book, The Tears of Fancie, or Love Disdained (1593), was posthumously published. This is a collection of sixty sonnets, regular in form, so far at least as to have fourteen lines each. Spenser is supposed to have alluded to the untimely death of Watson in Colin Clout's Come Home Again, when he says:—

"Amyntas quite is gone and lies full low,
Having his Amaryllis left to moan."

He is mentioned by Meres in company with Shakespeare, Peele and Marlowe among "the best for tragedy," but no dramatic work of his except the translations above mentioned has come down to us. It is certain that this poet enjoyed a great reputation in his lifetime, and that he was not without a direct influence upon the youth of Shakespeare. He was the first, after the original experiment made by Wyatt and Surrey, to introduce the pure imitation of Petrarch into English poetry. He was well read in Italian, French and Greek literature. Watson died young, and he had not escaped from a certain languor and insipidity which prevent his graceful verses from producing their full effect. This demerit is less obvious in his later pieces, and, with the development of the age, Watson, whose contemporaries regarded him as the greatest poet of his age, probably have gained power and music. As it is, he has the honour of being one of the direct forerunners of Shakespeare (in Venus and Adonis and in the Sonnets), and of being the leader in the long procession of Elizabethan sonnet-cycle writers.

(E. G.)

The English works of Watson, excepting the madrigals, were first collected by Edward Arber in 1870. Thomas Watson's "Italian Madrigals Englished" (1590) were reprinted (ed. F. J. Carpenter) from the Journal of Germanic Philology (vol. ii., No. 3. p. 357) with the original Italian, in 1899. See also Mr Sidney Lee's Introduction (pp. xxxii.-xxxiii.) to Elizabethan Sonnets in the new edition (1904) of An English Garland.
WATSON, WILLIAM (c. 1559-1603), English conspirator, was a native of the north of England, and was born probably on the 23rd of April 1559. In 1586 he became a Roman Catholic priest in France; and during the concluding years of Elizabeth's reign he made several visits to England; he was imprisoned and tortured more than once. He became prominent as a champion of the secular priests in their dispute with the Jesuits, and in 1601 some writings by him on this question appeared which were answered by Robert Parsons. When Elizabeth died, Watson hastened to Scotland to assure James I. of the loyalty of his party, and to forestall the Jesuits, who were suspected of intriguing with Spain. The new king did not, however, as was hoped, cease to exact the necessary fines; and the general dissatisfaction felt by the Roman Catholics gave rise to the "Bye plot," or "Watson's plot," in which connexion this priest's name is best known, and to its sequel the Main or Cobham's plot. Watson discussed the grievances of his co-religionists with another priest, William Clark, with Sir Griffin Markham and Anthony Copley, and with a disappointed Protestant courtier, George Brooke; they took another Protestant, Thomas, 15th Lord Grey de Wilton, into their confidence, and following many Scottish precedents it was arranged that James should be surprised and seized, while they talked loudly about capturing the Tower of London, converting the king to Romanism, and making Watton lord keeper. One or two of the conspirators drew back; but Watson and his remaining colleagues arranged to assemble at Greenwich on the 24th of June 1603, and under the pretence of presenting a petition to carry out their object. The plot was a complete failure; Henry Garnet and other Jesuits betrayed it to the authorities, and its principal authors were seized, Watson being captured in August at Hay on the Welsh border. They were tried at Winchester and found guilty; Watson and Clark were executed on the 9th of December 1603, and Brooke suffered the same fate a week later. Grey and Markham were reprieved. Before the executions took place, however, the failure of the Bye plot had led to the discovery of the Main plot. Brooke's share in the earlier scheme caused suspicion to fall upon his brother Henry Brooke, Lord Cobham, the ally and brother-in-law of Sir Robert Cecil, afterwards earl of Salisbury. Cobham appears to have been in communication with Spain about the possibility of killing "the king and his cubs" and of placing Lady Arabella Stuart on the throne. He was seized, tried and condemned to death, but although led out to the scaffold he was not executed. It was on suspicion of being associated with Cobham in this matter that Sir Walter Raleigh was arrested and tried.

See the documents printed by T. G. Law in The Archpriest controversy (1896-1898); the same writer's Jesuits and Seculars (1889), and S. R. Gardiner, History of England, vol. i. (1903).

WATSON, WILLIAM (1838- ), English poet, was born on the 2nd of August 1838 at Burley-in-Wharfedale, Yorkshire, and was brought up at Liverpool, whither his father moved for business. In 1868 he published his first book The Prince's Quest, a poem showing the influence of Keats and Tennyson, but giving little indication of the author's mature style. It attracted no attention until it was republished in 1893 after Mr Watson had made a name by other work. In 1884 appeared Epigrams of Art, Life and Nature, a remarkable little volume, which already showed the change to Mr Watson's characteristic restraint and concision of manner. But it passed unnoticed. Recognition came with the publication of Wordsworth's Grave in 1890; and fame with the publication of the second edition in 1891, and the appearance in the Fortnightly Review, August 1891, of an article by Mr. T. H. Green, "W. A. New Poet." W. A. N. stands for William Anstis Newcome, which marked a reversion from the current Tennysonian and Swinburnian fashion to the meditative note of Matthew Arnold, exhibited in full maturity Mr Watson's poetical qualities; his stately diction, his fastidious taste, his epigrammatic turn, his restrained yet eloquent utterance, his remarkable gift of literary criticism in poetic form. Besides Wordsworth's Grave the volume contained Ver teubosum (originally published in the National Review for June 1885), a series of political sonnets indicating a fervour of political conviction which was later to find still more impassioned expression; also a selection with additions from the Epigrams of 1884, and among other miscellaneous pieces his tribute to Arnold, "In Laleham Churchyard." During the years 1890-1892 he contributed articles to the National Review, Spectator, Illustrated London News, Academy, Bookman and Aalantewa, which were collected and republished in 1893 as Excursions in Criticism. In 1893 he also published Lactymaei Musorum, the poem which gave the title to the volume being a fine elegy on the death of Tennyson; and it included the poem on "Shelley's Century" (both of these printed privately in 1892), and "The Dream of Man," the earliest of his philosophical poems. The same year, too, saw the publication of The Empty Angels, a serio-comic triple of small merit, dedicated to Grant Allen. During this year Mr Gladstone bestowed on him the Civil List pension of £200 available on the death of Tennyson. In 1894 followed Odes and Other Poems, and in 1895 The Father of the Forest, which contained also the fine "Hymn to the Sea" in English elegiacs (originally contributed to the Yellow Book), "The Tomb of Burns," and "Apologia," a piece of candid and just self-criticism. The volume contained also a sonnet "To the Turk in Armenia," a prelude to the series of sonnets about Armenia contributed to the Westminster Gazette and republished in a brochure called The Purple Furtse in 1896. These sonnets were republished with revision and considerable additions, and a preface by the bishop of Hereford, in The Year of Shame in 1897. Whatever view was taken of the poet's incursion into politics, no one doubted his passionate sincerity, or the excellence of the poetical rhetoric it inspired. In 1898 were published his Collected Poems and a volume of new poetry The Hope of the World, which opened with his three chief philosophical poems, the title piece, "The Unknown God," and "Ode in May." In 1902 he printed privately 50 copies of New Poems, and published his "Ode on the Coronation of King Edward VII," a favourable specimen of its class; and in 1903 besides a volume of Selected Poems a collection of poems contributed to various periodicals and called For England: Poems Written During Estrangement, a poetical defence of his impugned patriotism during the Boer War. In 1909 appeared an important volume of New Poems.

Mr Watson's poetry falls chiefly into the classes above indicated—critical, philosophical and political—to which may be added a further class of Horatian epistles to his friends. This class, wation indicates the high character and also the limitations of his poetry. It is contemplative, not dramatic, and only occasionally lyrical in impulse. In spite of the poet's plea in his "Apologia" that there is an ardour and a fire other than that of Eros or Aphrodite, ardour and fire are not conspicuous qualities of his verse. Except in his political verse there is more thought than passion. Bearing trace enough of the influence of the romantic epoch, his poetry recalls the earlier classical period in its epigrammatic phrasing and Latinized diction. By the distinction and clarity of his style and the dignity of his movement William Watson stands in the true classical tradition of great English verse, in a generation rather given over to lawlessness and experiment.

See also section on William Watson in Poets of the Younger Generation, by William Archer (1902); and for bibliography up to Aug. 1903, English Illustrated Magazine, vol. xxix. (N.S.), pp. 542 and 549. (W. F. J.)

WATT, JAMES (1736-1819), Scottish engineer, the inventor of the modern condensing steam-engine, was born at Greenock on the 10th of January 1736. His father was a small merchant who early died; his mother married a wealthy merchant named Hay, and James was early thrown on his own resources. Having a taste for mechanics he made his way to London, at the age of nineteen, to learn the business of a philosophical-instrument maker, and became apprenticed to one John Morgan, in whose service he remained for twelve months. From a child he had been extremely delicate, and the hard work and frugal living of his London puerpilage taxed his strength so severely that he was forced at the end of a year to seek rest at home, not, however,
WATT

was F. In layer the leading of piston conditions water and months in handy. He took him under its protection, and in 1757 he was established in its precepts with the title of mathematical-instrument maker to the university.

Before many months Joseph Black, the discoverer of latent heat, then lecturer on chemistry, and John Robison, then a student, afterwards professor of natural philosophy, became his intimate friends, and with them he often discussed the possibility of improving the steam-engine, of which at that time Thomas Newcomen's was the most advanced type. The engine was then applied only to pumping water—chiefly in the drainage of mines; and it was so clumsy and wasteful of fuel as to be but little used. Some early experiments of Watt in 1761 or 1762 led to no positive result, but in 1764 his attention was seriously drawn to the matter by having a model of Newcomen's engine, which formed part of the college collection of scientific apparatus, given him to examine. In order, therefore, he was at once struck with its enormous consumption of steam, and set himself to examine the cause of this and to find a remedy.

In Newcomen's engine the cylinder stood vertically under one end of the main lever or "beam" and was open at the top. Steam, at a pressure scarcely greater than that of the atmosphere, was admitted to the under side; this allowed the piston to be pulled up by a counterpoise at the other end of the beam. Communication with the boiler was then shut off, and the steam in the cylinder was condensed by injecting a jet of cold water from a cistern above. The pressure of the air on top of the piston then drove it down, raising the counterpoise and doing work. The injection water and condensed steam which had gathered in the cylinder were drained out by a pipe leading down into a well.

Watt at once noticed that the alternate heating and cooling of the cylinder in Newcomen's engine made it work with tedious slowness and excessive consumption of steam. When steam was admitted at the beginning of each stroke, it found the metal of the cylinder and piston chilled by contact with the condensed steam and cold injection water of the previous stroke, and it was wrenched to pieces. Afterward, the line was followed by the Crinan and Caledonian canals. He prepared plans for the harbours of Ayr, Port-Glasgow and Greenock, for deepening the Clyde, and for building a bridge over it at Hamilton. In the course of this work he invented a simple micrometer for measuring distances, consisting of a pair of horizontal hairs placed in the focus of a telescope, through which sights were taken to a fixed and movable target on a rod held upright at the place whose distance from the observer was to be determined. The micrometer was varied in a number of ways; and another fruit of his ingenuity about the same time was a machine to facilitate drawing in perspective.

Meanwhile the engine had not been wholly neglected. Watt had secured his patent; the Kinnell trials had given him a store of valuable experience; Roebuck had failed, but another partner was ready to take his place. In 1768 Watt had made the acquaintance of Matthew Boulton, a man of energy and capital, who owned the Soho engineering works at Birmingham. Boulton agreed to take Roebuck's share in the invention, and to join Watt in applying to parliament for an act to prolong the term of the patent. The application was successful. In 1775 an act was passed continuing the patent for twenty-five years. By this time the inventor had abandoned his civil engineering work and had settled in Birmingham, where the manufacture of steam-engines was begun by the firm of Boulton & Watt. The partnership was a singularly happy one. Boulton had the good sense to leave the work of inventing to Watt, in whose communication was made between it and the cylinder, steam would pass over from the cylinder and be condensed; the pressure in the cylinder would be as low as the pressure in the condenser, but the temperature of the metal of the cylinder would remain high, since no injection water need touch it. Without delay Watt put this idea to the test, and found that the separate condenser did act as he had anticipated. To maintain the vacuum in it he added another new organ, namely, the air-pump, the function of which is to remove the condensed steam and water of injection along with any air that gathers in the condenser.

To further his object of keeping the cylinder hot as the steam that entered it, Watt supplemented his great invention of the separate condenser by several less notable but still important improvements. In Newcomen's engine a layer of water over the piston had been used to keep it steadier, and to substitute a tighter packing lubricated by oil. In Newcomen's engine the upper end of the cylinder was open to the air; Watt covered it in, leading the piston-rod through a steam-tight stuffing box in the cover, and allowed steam instead of air to press on the top of the piston. In Newcomen's engine the cylinder had no clothing to reduce loss of heat by radiation and conduction from its outer surface; Watt not only cased it in non-conducting material, such as wood, but introduced a steam-jacket, or layer of steam, between the cylinder proper and an outer casing.

All these features were specified in his first patent (see STEAM-ENGINE), which, however, was not obtained till January 1769, nearly four years after the inventions it covers had been made. In the interval Watt had been striving to demonstrate the merits of his engine by trial on a large scale. His earliest experiments left him in debt, and, finding that his own means were quite insufficient to allow him to continue them, he agreed that Dr John Roebuck, founder of the Carron ironworks, should take two-thirds of the profits of the invention in consideration of his bearing the cost. An engine was then erected at Kinnell, near Strathmore, and this gave Watt the opportunity of facing many difficulties in details of construction. But the experiments made slow progress, for Roebuck's affairs became embarrassed, and Watt's attention was engaged by other work. He had taken to surveying, and was fast gaining reputation as a civil engineer. In 1767 he was employed to make a survey for a Fort and Clyde canal—a scheme which failed to secure parliamentary sanction. This was followed during the next six years by surveys for a canal at Monkland, for another through the valley of Strathmore from Perth to Forfar, and for various lines of canals along the Clyde valley, followed by the Crinan and Caledonian canals. He prepared plans for the harbours of Ayr, Port-Glasgow and Greenock, for deepening the Clyde, and for building a bridge over it at Hamilton. In the course of this work he invented a simple micrometer for measuring distances, consisting of a pair of horizontal hairs placed in the focus of a telescope, through which sights were taken to a fixed and movable target on a rod held upright at the place whose distance from the observer was to be determined. The micrometer was varied in a number of ways; and another fruit of his ingenuity about the same time was a machine to facilitate drawing in perspective.

Meanwhile the engine had not been wholly neglected. Watt had secured his patent; the Kinnell trials had given him a store of valuable experience; Roebuck had failed, but another partner was ready to take his place. In 1768 Watt had made the acquaintance of Matthew Boulton, a man of energy and capital, who owned the Soho engineering works at Birmingham. Boulton agreed to take Roebuck's share in the invention, and to join Watt in applying to parliament for an act to prolong the term of the patent. The application was successful. In 1775 an act was passed continuing the patent for twenty-five years. By this time the inventor had abandoned his civil engineering work and had settled in Birmingham, where the manufacture of steam-engines was begun by the firm of Boulton & Watt. The partnership was a singularly happy one. Boulton had the good sense to leave the work of inventing to Watt, in whose
genius he had the fullest faith; on the other hand, his substantial means, his enterprise, resolution and business capacity supplied what was wanting to bring the invention to commercial success.

During the next ten years we find Watt assiduously engaged in developing and introducing the engine. Its first and for a time its only application was in pumping; it was at once put to this use in the mines of Cornwall, where Watt was now frequently engaged in superintending the erection of engines. Further inventions were required to fit it for other uses, and these followed in quick succession. Watt's second steam-engine patent is dated 1781. It describes five different methods of converting the reciprocating motion of the piston into motion of rotation, so as to adapt the engine for driving ordinary machinery. The simplest way of doing this, and the means now universally followed, is by a crank and fly-wheel; this had occurred to Watt, but had meanwhile been patented by another, and hence he devised the "sun and planet wheels" and other equivalent contrivances. A third patent, in 1782, contained two new inventions of the first importance. Up to this time the engine had been single-acting; Watt now made it double-acting; that is to say, both ends of the cylinder, instead of only one, were alternately put in communication with the boiler and the condenser. Up to this time the steam had been admitted from the boiler only at the instant when the piston was about to start its stroke, but Watt now introduced the system of expansive working, in which the admission valve is closed after a portion only of the stroke is performed, and the steam enclosed in the cylinder is then allowed to expand during the remainder of the stroke, doing additional work upon the piston without making any further demand upon the boiler until the next stroke requires a fresh admission of steam. He calculated that, as the piston advanced after admission had ceased, the pressure of the steam in the cylinder would fall in the same proportion as its volume increased — a law which, although not strictly true, does accord very closely with the actual behaviour of steam expanding in the cylinder of an engine. Recognizing that this would cause a gradual reduction of the force with which the piston pulled or pushed against the beam, Watt devised a number of contrivances for equalizing the effort throughout the stroke. He found, however, that the inertia of the pump-rods in his mine engines, and the fly-wheel in his rotative engines, served to compensate for the inequality of thrust sufficiently to make these contrivances unnecessary. His fourth patent, taken out in 1784, describes what Watt himself called "particular ingenuity of the crank and connecting rod": links by which the top of the piston-rod is connected to the beam so that it may either pull or push, and is at the same time guided to move in a sensibly straight line. "I have started a new hare," he writes to Boulton in June of that year; "I have got a glimpse of a method of causing a piston-rod to move up and down perpendicularly by only fixing it to a piece of iron upon the beam, without chains or perpendicular guides or untowardly frictions, arch-heads, or other pieces of clumsiness. I think it a very probable thing to succeed, and one of the most ingenious simple pieces of mechanism I have contrived."

A still later invention was the throttle-valve and centrifugal governor, by which the speed of rotative engines was automatically controlled. One more item in the list of Watt's contributions to the development of the steam-engine is too important to be passed without mention: the indicator, which draws a diagram of the relation of the steam's pressure to its volume as the stroke proceeds, was first used by Boulton & Watt to measure the work done by their engines, and so to give a basis on which the charges levied from their customers were adjusted. It would be difficult to exaggerate the part which the invention has played in the instrument-making of the steam-engine. The eminently philosophic notion of an indicator diagram is fundamental in the theory of thermodynamics; the instrument itself is to the steam engineer what the stethoscope is to the physician, and more, for with it he not only diagnoses the ailments of a faulty machine, whether in one or another of its organs, but gauges its power in health.

The commercial success of the engine was not long in being established. By 1783 all but one of the Newcomen pumping-engines in Cornwall had been displaced by Watt's. The mines were then far fact thriving; many were even on the point of being abandoned through want of large volumes of water; and Watt's invention, which allowed this to be done at a moderate cost, meant for many of them a new lease of life. His engine used no more than a fourth of the fuel that had formerly been needed to do the same work, and the Soho firm usually claimed by way of royalty a sum equivalent to one-third of the saving—a sum which must have been nearly equal to the cost of the fuel actually consumed. Rival manufacturers came forward, amongst whom Edward Bull and Jonathan Carter Hornblower are the most conspicuous names. Their engine was not on the same lines as Watt's, and they infringed Watt's patent by the use of a separate condenser.

When action was taken against them on that ground, they retaliated by disputing the validity of the fundamental patent of 1769. In the case of Boulton & Watt v. Bull the court was divided on this point, but in an action against Hornblower the patent was definitely affirmed to be valid by a unanimous finding of the Court of King's Bench. This was in 1799, only a year before the monopoly expired, but the decision enabled the firm to claim a large sum as arrears of patent dues. In 1800, just before Watt himself, as well as his early friends Black and Robison, drew up narratives of the invention of the steam-engine, which are of much interest to the student of its history.¹

Before Watt's time the steam-engine was exclusively a steam-pump, slow-working, cumbrous and excessively wasteful of fuel. His first patent made it quick in working, powerful and efficient, but still only as a steam-pump. His later inventions adapted it to driving machinery of all kinds, and made it virtually what it is to-day, save in three respects. In respect of mechanical arrangement the modern engine differs from Watt's chiefly in this, that the beam, an indispensable feature in the early pumping-engines, and which had held his invention at first is now generally dropped, has gradually given way to more direct modes of connecting the piston with the crank. Another difference is in the modern use of high-pressure steam. It is remarkable that Watt, notwithstanding the fact that his own invention of expansive working must have opened his eyes to the advantage of high-pressure steam, declined to admit it into his practice. He persisted in the use of pressures that were little if at all above that of the atmosphere. His rivals in Cornwall were not so squeamish. Richard Trevithick ventured as far as 120 lb. on the square inch, and a curious episode in the history of the steam-engine is an attempt which Boulton & Watt made in 1788 to raise the steam pressure to 200 lb. per square inch high enough to drive the engines of the coal mines where they were working, but it was not successful. The third and only other respect in which a great improvement has been effected is in the introduction of compound expansion. Here, too, one cannot but regret to find the Soho firm hostile, though the necessity of defending their monopoly makes their action natural enough. Hornblower had in fact stumbled on the invention of the compound engine, but as his machine employed Watt's heat sensor it was suppressed, to be revived after some years by Arthur Woolf (1766–1837). In one of his patents (1784) Watt describes a steam locomotive, but he never prosecuted this, and when William Murdoch, his chief assistant (famous as the inventor of gas-lighting), made experiments on the same lines, Watt gave him little encouragement. The notion then was to use a steam carriage on ordinary roads; its use on railways had not yet been thought of. When that idea took form later in the last years of Watt's life, the old man refused to smile upon his offspring; it is even said that he put a clause in the lease of his house that no steam carriage should on any pretext be allowed to approach it.

On the expiry in 1800 of the act by which the patent of 1769 had been extended, Watt gave up his share in the business of engine-building to his sons, James, who carried it on along with a son of Boulton for many years, and Gregory, who died in 1820. The remainder of his life was spent mostly at Duddingston Fell, his house near Edinburgh, where he devoted his time, with scarcely an interruption, to mechanical pursuits. His last work was the invention of machines for copying sculpture.

¹ Another narrative of the utmost interest was written by Watt in 1819, and was published in the form of a letter, from the fourth edition of the Encyclopaedia Britannica, which Watt revised before it was reprinted in the collected edition of Robison's works. See Robison's Mechanical Philosophy, vol. ii.
—one for making reduced copies, another for taking facsimiles by means of a light stiff frame, which carried a pointer over the surface of the work while a revolving tool fixed to the frame alongside of the pointer cut a corresponding surface on a suitable block. We find him in correspondence with Sir Francis Chantrey about his machines, not many months before his death, and presenting copies of busts to his friends as the work "of a young artist just entering on his eighty-third year." His life drew to a tranquil close, and the end came at Heathfield on the 19th of August 1819. His remains were interred in the neighbouring parish church of Handsworth.

Watt was twice married—first in 1763 to his cousin Margaret Miller, who died ten years later. Of four children born of the marriage, two died in infancy; another was James (1769–1848), who succeeded his father in business; the fourth was a daughter who lived to maturity, but died early, leaving two children. His second wife, Anne Macgregor, whom he married before settling in Birmingham in 1775, survived him; but her two children, Gregory and a daughter, died young.

Some of Watt's minor inventions have been already noticed. Another, which has proved of great practical value, was the letter-copying machine. His correspondence was written on plain paper, and the writing was made up in a cut paper in such a way as to enables the written page to be cut out and placed in a box, in which it was preserved as a manuscript. The invention is now called energy, but as a discoverer of the composition of water. Writing to Joseph Priestley in April 1783, with reference to some of Priestley's experiments, he suggests the theory that "water is composed of two elements, air and phlogiston derided of part of their latent or elementary heat." It is difficult to determine the exact meaning attached to these antiquated terms, and to say how far Watt's suggestion anticipated the fuller discovery of Cavendish's. Watt's papers were destroyed after his death in 1783. The Cavendish Society printed Cavendish's experiments in 1784, and both are printed in the same volume of "The Philosophical Transactions."

The early and middle part of Watt's life was a long struggle with poor health: severe headache prostrated him for days at a time; but as he grew old his constitution seems to have become more robust. His disposition was despondent and shrinking; he speaks of himself, but evidently with unfair severity, as "indolent to excess." "I am not enterprising," he writes; "I would rather face a loaded cannon than settle an account or make a bargain; in short, I find myself out of my sphere when I have anything to do with making any arrangements, and in keeping me in the background is a personal memorial of the greatest interest in his numerous letters. They are full of sagacity and insight: his own accomplishments are told with humorous modesty, yet with a sense of their value, and in a style of remarkable terseness and lucidity, lightened here and there by a touch of dry humour. In his old age Watt is described by his contemporaries as a man richly stored with the most various knowledge, and shrewdly discerning the thoughts and feelings of the literary, a great talker. Scott speaks of "the alert, kind, benevolent old man, his talents and faculty (overlooking on every subject, with his attention alive to every one's question, his information at every one's command."

WATTEAU, ANTOINE (1684–1721), French painter, was born in Valenciennes, of humble Flemish origin. Antoine de Caylus, his staunch friend of later years, and his first biographer, refers to Watteau's father as a hard man, strongly disinclined to accede to his son's wish to become a painter; but other accounts show him in a kinder light—as a poor, struggling man, a tailor by trade, who secured for his son the best possible education. Certain it is that at the age of fourteen Watteau was placed with Gérin, a mediocre Valenciennes painter, with whom he remained until 1702. It is to be assumed that he learnt far more from the study of Ostade's and Teniers' paintings in his native town than from his first master's teaching. Not only in subject-matter, but in their general tonality, his earliest works, like "La Vraie Gaiété," which was in the collection of Sir Charles Temple, suggest this influence. Gérin died in 1707, and Watteau, almost penniless, went to Paris, where he found employment with the scene-painter Metoyer. Things, however, went badly with his new master, and Watteau, broken down in health and on the verge of starvation, was forced to work in a kind of factory where devotional pictures were turned out in wholesale fashion. Three francs a week and meagre food were his reward; but his talent soon enabled him to paint the St Nicolas, the copying of which was allotted to him, without having to refer to the original. Meanwhile he spent his rare leisure hours and the evenings in serious study, sketching and drawing his impressions of types and scenes. His drawings attracted the attention of Claude Gillot, an artist imbued with the spirit of the Renaissance, who after having successfully tried himself in the mythological and historical genre, was just at that time devoting himself to the characters and incidents of the Italian comedy. Gillot took Watteau as pupil and assistant, but the young man made such rapid progress that he soon equalled and excelled his master, whose jealousy led to a quarrel, as a result of which Watteau, and with him his fellow-student and later pupil, Levi, deserted his master's circle. The brief period of his life, 1708 the studio of Claude Audran, a famous decorative painter who was at that time keeper of the collections at the Luxembourg Palace. From him Watteau acquired his knowledge of decorative art and ornamental design, the garland-like composition which he applied to the designing of screens, fans and wall panels. At the same time he became deeply imbued with the spirit of Rubens and Paolo Veronese, whose works he had daily before him at the palace; and he continued to work from nature and to collect material for his formal garden backgrounds among the fountains and statues and shady avenues of the Luxembourg gardens. His "Chinoiseries and Sirenges" date probably from the years during which he worked with Audran.

Perhaps as a recreation from the routine of ornamental design, Watteau painted at this time "The Departing Regiment," the first picture in his second and more personal manner, in which the touch reveals the influence of Rubens's technique, and which is the first of a long series of camp pictures. He showed the painting to Audran, who, probably afraid of losing so talented and useful an assistant, made light of it, and advised him not to waste his time and gifts on such subjects. Watteau, suspicious of Audran's motives, wrote his letters to his friends in the Netherlands as excuse to return to Valenciennes. He found a purchaser, at the modest price of 60 livres, in Sirois, the father-in-law of his later friend and patron Geraist, and was thus enabled to return to the home of his childhood. In Valenciennes he painted a number of the small camp-pieces, notably the "Camp-Fire," which was again bought by Sirois, the price this time being raised to 200 livres; this is now in the collection of Mr W. A. Coats in Glasgow. Two small pictures of the same type are at the Hermitage in St Petersburg.

Watteau, however, after returning to Paris, and during a very short sojourn in Valenciennes, took up his abode with Sirois, and competed in 1709 for the Prix de Rome. He only obtained the second prize, and determined to go to Rome, he applied for a crown pension and exhibited the two military pictures which he had sold to Sirois, in a place where they were bound to be seen by the academicians. There they attracted the attention of de la Fosse, who, struck by the rare gifts displayed in these works, sent for Watteau and dissuaded him from going to Italy, where he had nothing to learn. It was to a great extent due to de la Fosse that Watteau was made an associate of the Academy in 1712, and a full member in 1717, on the completion of his diploma picture, "The Embarkment for Cythera," now at the Louvre. A later, and even more perfect, version of the same subject is in the possession of the German emperor. It is quite possible that the superb portrait of Rigaud by Watteau.
WATTENBACH—WATTERSON

belonging to Mr Hodgkins, was painted in acknowledgment of Riaguas's friendly action.

Watteau now went to live with Crozat, the greatest private art collector of his time, for whom he painted a set of four decorative panels of "The Seasons," one of which, "Summer," is now in the collection of Mr Lionel Phillips. Crozat left at his death some 500 paintings and 10,000 drawings by the masters. It is easy to imagine how Watteau roamed among these treasures, and became more and more familiar with Rubens and the great Venetians. In 1719 or 1720 the state of his health had become so bad that he was compelled to隨, and the French poets and their sufferer and hero. It is said that Watteau and Boucher made the best of his time, he worked with feverish haste. Among his last paintings were a "Crucifixion" for the curé of Nogent, and a portrait of the famous Venetian pastorist Rosalba Carriera, who at the time painted her portrait of Watteau. His restlessness increased with the progress of his disease; he wished to return to Valenciennes, but the long journey was too dangerous; he sent for his pupil Pater, whom he had dismissed in a fit of ill-temper, and whom he now kept by his side for a month to give him the benefit of his experience; and on the 18th of July 1721 he died in Gersaint's arms. Watteau's position in French art is one of unique importance, for, though Flemish by descent, he was more French in his art than any of his French contemporaries. He became the founder—and at the same time the culmination—of a new school which marked a revolt against the pompous playful classicism of the Louis XIV period. The vitality of his art was due to the rare combination of a poet's imagination with a power of seizing reality. In his treatment of the landscape background and of the atmospheric surroundings of the figures can be found the germs of impressionism. All the later theories of light and its effect upon the objects in nature arc foreshadowed in Watteau's fêtes champêtres, which give at the same time a characteristic, though highly idealized, picture of the artificiality of the life of his time. He is the initiator of the Louis XV period, but, except in a few rare cases, his paintings are entirely free from the licentiousness of his followers Lancret and Pater, and even more of Boucher and Fragonard. During the last years of his life Watteau's art was highly esteemed by such fine judges as Sirois, Gersaint, the conte de Caylus, and M. de Julienne, the last of whom had a whole collection of the master's paintings and sketches, and published in 1734 the Abridé de la vie de Watteau, an introduction to the four volumes of engravings after Watteau by Cochon, Thomassin, Le Bas, Liottard and others. From the middle of the 18th century to about 1875, when Edmond de Goncourt published his Catalogue raisonné of Watteau's works and Caylus's discourse on Watteau delivered at the Academy in 1748, the discovery of which is also due to the brothers de Goncourt, Watteau was held in such slight esteem that the prices realized by his paintings at public auction rarely exceeded £100. Then the reaction set in, and in 1819 the "Occupation aux Affaires" realized 3500 guineas at Christie's, and "Perfect Harmony" 3500 guineas. At the Bourgeois sale at Cologne in 1904 "The Village Bride" fetched £5000. The finest collection of Watteau's works is in the possession of the German emperor, who owns as many as thirteen, all of the best period, and mostly from M. de Julienne's collection. At the Kaiser Friedrich museum in Berlin are two scenes from the Italian and French comedy and a fête champêtre. In the Wallace Collection are nine of his paintings, among them "Rustic Amusements," "The Return from the Chase," "Gilles and his Family," "The Music Party," "A Lady at her Toilet" and "Harlequin and Columbine." The Louvre owns, besides the diploma picture, the "Antiope," "The Assemble in the Park," "Autumn," "Indifference," "La Finette," "Gilles," "A Reunion" and "The False Step," as well as thirty-one original drawings. Other paintings of importance are at the Dresden, Glasgow, Edinburgh, St Petersburg and Vienna galleries; and a number of drawings are to be found at the British Museum and the Albertina in Vienna. Of the few portraits known to have been painted by Watteau, one is in the collection of the late M. Grout in Paris.

AUTHORITIES.—Since the resuscitation of Watteau's fame by de Goncourt, an extensive literature has grown around his life and work. The basis for all later research is furnished by Caylus's somewhat academic Life, Gersaint's Catalogue raisonné (Paris, 1744), and Julienne's Abrégé. For Watteau's childhood the most trustworthy information will be found in Cellier's Watteau, son enfance, ses contemporains (Valenciennes, 1867). Of the greatest importance is the Catalogue raisonné de l'œuvre de Watteau, by E. de Goncourt (1875), and the essay on Watteau by the brothers de Goncourt in L'Art du XVIIIe siècle. See also Watteau by Paul Mantz (Paris, 1802); "Antoine Watteau," by G. Dargent (Les Artistes célèbres, Paris, 1881); Watteau, by Gabriel Sällies (Paris, 1911); Aline Watteau (Paris, 1930); and Smits, Le fétichiste Goncourt (Paris, 1932). Among the best recent studies, some of exceptional value, is the study by H. Schiffer, Das gesamte Werk der christlichen Kirche in Böhmen und Mähren (Vienna, 1894); Geschichte des römischen Papsttums (Berlin, 1876); and Anleitung zur Rosenbergische Paläographie (Leipzig, 1897, and again 1925).

WATTENBACH, WILHELM (1830–1897), German historian, was born at Ranzau in Holstein on the 22nd of September 1819. He studied philology at the universities of Bonn, Göttingen and Berlin, and in 1843 he began to work upon the Monumenta Germaniae historica. In 1855 he was appointed archivist at Breisgau; in 1856 he became professor of history at Heidelberg, and ten years later professor at Berlin, where he was a member of the directorial body of the Monumenta and a member of the Academy. He died at Frankfurt on the 21st of September 1867. Watteau was distinguished by his thorough knowledge of the chronicles and other original documents of the middle ages, and his most valuable work was done in this field.

His principal book, Deutschnahlichen Geschichtsquellen im Mittelalter bis zur Mitte des 13. Jahrhunderts, is unrivalled as a guide to the sources of the history of Germany in the middle ages; this was first published in 1858, and has passed through several editions. Cognate works are his Anleitung zur lateinischen Paläographie (Leipzig, 1869, and again 1886), and Das Schriftmuseum im Mittelalter (Leipzig, 1871, and again 1896). Among other works is his Geschichte der christlichen Kirche in Böhmen und Mähren (Vienna, 1894); Geschichte des römischen Papsttums (Berlin, 1876); and Anleitung zur germanische Paläographie (Leipzig, 1897, and again 1925).

WATTERSON, HENRY (1840–1911), American journalist, was born in Washington, D.C., on the 16th of February 1850. His father, Harvey McGee Watterson (1811–1891), was a journalist and lawyer, and was a Democratic representative in Congress in 1839–1843. The son was educated by private tutors, and between 1858 and 1861 was editor of the Washington States and of the Democratic Review. During the Civil War he served in the Confederate army as aide-de-camp to General Nathan B. Forrest and to General Leonidas Polk in 1861–1862; he was editor of the Chattanooga Rebel in 1862–1863, and was chief of scouts in General Joseph E. Johnston's army in 1864. In 1865–1867 he was an editor of the Republican Banner, at Nashville, Tennessee, and in 1867–1868 he was editor of the Journal at Louisville, Kentucky. In 1868 he with W. N. Haldeman he started the Louisville Courier-Journal, a consolidation of the Courier (1843), the Democrat (1844), and the Journal (1850); and it soon became one of the most influential of Southern newspapers. He was a Democratic representative in Congress from August 1876 to March 1877, and was delegate at large to the National Democratic Conventions of 1876, 1880, 1884, 1888 and 1892, serving as temporary chairman in 1876, and as chairman of the platform committee in 1880 and 1888. He became widely known as a lecturer and orator. His publications include History of the Spanish-American War (1890) and The Compromises of Life (1902).
WATTIGNIES—WATTMETER

WATTIGNIES, a village of France 53 m. S.S.E. of Maubeuge, the scene of a battle in the French Revolutionary Wars (q.v.), fought on the 15th-16th October 1793. The Allied army, chiefly Austrians, under Coburg, was besieging Maubeuge, and the Revolutionary army, preparing to relieve it, gathered behind Avesnes. Coburg dispatched a covering force of 11,000 to the Avesnes-Maubeuge road, 5000 on the right with their flank on the Sambre, 4000 in the centre, on a ridge in an amphitheatre of woods, and 6000 on the left, chiefly on the plateau of Wattignies. A long line of woods enabled the Republican commander, Jourdan, to deploy unseen; 14,000 men were to attack the right, 16,000 were sent towards Wattignies, and 13,000 were to demonstrate in the centre till the others had succeeded and then to attack. Meantime (though this part of the programme miscarried) the Maubeuge garrison, which was almost as strong as its besiegers, was to sally out. Even without the Maubeuge garrison Jourdan had a two-to-one superiority. But the French were still the undisciplined enthusiasts of Hondschoote. Their left attack progressed so long as it could use "dead ground" in the valleys, but when the Republicans reached the gentler slopes above, the volleys of the Austrian regulars crushed their swarms, and the Austrian cavalry, striking them in flank, rode over them. The centre attack, ordered by Carnot on the assumption that all was well on the flanks, was premature; like the left, it progressed while the slopes were sharp, but when the Republicans arrived on the crest they found a gentle reverse slope before them, at the foot of which was Wattignies. Jourdan, the di- \( \text{c} \) plined valleys and a well-timed cavalry charge swept back the assailants. The French right reached, but could not hold, Wattignies. But these reverses were, in the eyes of Carnot and Jourdan, mere mishaps. Jourdan wished to renew the left attack, but Carnot, the engineer, considered the Wattignies plateau the key of the position and his opinion prevailed. In the night the nearly equal partition of force, which was largely responsible for the failure, was modified, and the strength of the attack massed opposite Wattignies. Coburg meanwhile strengthened his centre. He heard that Jourdan had been reenforced to up to 100,000. But he called up fresh battalions, and put into line only 23,000 men. In reality Jourdan had not received reinforcements, and the effects of the first failure almost neutralized the superiority of numbers and enthusiasm over discipline and confidence. But at last, after a long fight had eliminated the faint-hearted, enough brave men remained in the excited crowds held together by Carnot and Jourdan to win the plateau. Coburg then drew off. His losses were 2500 out of 23,000, Jourdan’s 3000 out of 42,000.

WATTMETER, a term in architecture (Lat. crassitas) applied to a wall made of rough stone, with small spaces between them and then plastered over. It is probably one of the oldest systems of construction; the Egyptians employed the stems of maize for the upright stakes; these were secured together with withes and covered over with mud, the upper portions of the maize stems being left uncut at the top, to increase the height of the enclosure; and these are thought by Professor Petrie to have given the origin for the cavetto cornice of the temples, the torus moulding representing the heavier coil, which then at the top of the fence wall. Vitruvius (i. 8) refers to it as being used in Rome. In the middle ages in England it was employed as a framework for hay chimneys.

WATTMETER, an instrument for the measurement of electric power, or the rate of supply of electric energy to any circuit. The term is generally applied to describe a particular form of electrodyomometer, consisting of a fixed coil of wire and an embracing or neighbouring coil of wire suspended so as to be movable. In general construction the instrument resembles a Siemens electrodyomometer (see AMPERMETER). The fixed coil is called the current coil, and the movable coil is called the potential coil, and each of these coils has its ends brought to separate terminals on the instrument itself.

In the principle on which the instrument works is as follows: Suppose any circuit, such as an electric motor, lamp or transformer, is receiving electric current; then the power given to that circuit reckoned in watts is measured by the product of the current flowing through the circuit in amperes and the potential difference of the ends of that circuit in volts, multiplied by a certain factor called the power factor in those cases in which the circuit is inductive and the current alternating.

In the simplest case of a non-inductive power-absorbing circuit. If an electro-dynamometer, made as above described, has its fixed circuit connected in series with the power-absorbing circuit and its movable coil (wound with fine wire) connected across the terminals of the power-absorbing circuit, a current will flow through the fixed coil which is the same as or nearly the same as that through the power-absorbing circuit, and a current will flow through the movable coil proportional to the potential difference at the terminals of the power-absorbing circuit. The movable coil of the wattmeter is normally suspended so that its axis is at right angles to that of the fixed coil and is constrained by a spiral spring of tension sufficient to keep the two coils, forces are brought into action compelling the coils to set their axes in the same direction, and these forces can be opposed by another torque due to the control of a spring spiral regulated by moving a pointer head on the instrument. The torque required to hold the coils in their normal position is proportional to the mean value of the product of the currents flowing through two coils respectively, or to the mean value of the product of the current in the power-absorbing circuit (fixed coil) and the current in the movable coil of the instrument. Hence this power can be measured by the torsion which must be applied to the revolving plate in order to hold it in the right position against the action of the forces tending to displace it. The wattmeter can therefore be calibrated so as to give direct readings of the power reckoned in watts, taken up in the circuit; and it is only necessary to multiply these readings by the power factor to obtain the true power absorbed. If these circumstances are fulfilled, the instrument is called a wattmeter and is an instrument for measuring the instantaneous power in a circuit. Its axis is fixed, but it is moveable. If the circuit contains alternating currents, the power-factor is sometimes employed for its use in determining the mean value of the power absorbed, if the circuit contains alternating currents.

In order that a wattmeter shall be suitable for the measurement of alternating currents a circuit (wattmeter circuit) of the form described must be completed. The framework and case of the instrument must be completely non-metallic, else eddy currents are induced in the metal of the case which supports the moving parts and act on the movable coil. Again the shunt circuit must be capable of taking the zero inductance and the series or current coil must be wound or constructed with stranded copper wire, each strand being silver covered, to prevent the production of eddy currents in the mass of the conductor. Wattmeters of this kind have been devised by J. A. Fleming, Lord Kelvin and W. Duddell and Mather. W. E. Sumpter, however, has devised forms of wattmeters of the dynamometer type in which iron cores are employed, and has defined the conditions under which these instruments are available for accurate measurements. See "New Alternate Current Instruments," Jour. Inst. Elec. Eng., 41, 227 (1908).

The most useful method of measuring the electrical power by means of electrostatic voltmeters, or of quadrant electrometers adapted for the purpose, when so employed may be called electrometric. If the quantity of electricity (e) passing through a circuit (s.) is connected to the ends of a non-inductive circuit in series with the power-absorbing circuit, and if the needle is connected to the end of this last circuit opposite to that at which the inductionless resistance is connected, the deflection of this needle is thus proportional to the power taken up in the circuit, since it is proportional to the mean value of (A-B) [C-\( \frac{1}{2} \) (A+B)], where A and B are the potentials of the quadrants and C is that of the needle. Thus it is evident, however, that the instruments on which these are based are false for an inductive circuit. In the case of the voltmeter method of measuring power devised by W. E. Ayrton and W. E. Sumpter in 1891, an electrostatic voltmeter is employed to measure the fall of potential V down any inductive circuit in which it is desired to

\[ P = \frac{1}{2} \pi \mu \rho \cos \theta \]

For the proof of this formula see J. A. Fleming, The Alternate Current Transformer in Theory and Practice, 1. 168.
measure the power absorption, and also the volt-drop $V_2$ down an inductionless resistance $R$ in series with it, and also the volt-drop $V_2$ down the two together. The power absorption is then given by the expression 

$$P = \frac{2}{3} (V_1^2 - V_2^2 + V_3^2)$$

Watts, Alaric Alexander (1797-1864), English journalist and poet, was the son of John Mosley Watts and grandson of William Watts, a Leicester physician of repute. After leaving school he made his living for a short time by teaching, and in 1818 joined the staff of the New Monthly Magazine in London, becoming about the same time a contributor to the Literary Gazette. In 1822 he was made editor of the Leeds Intelligencer, in the columns of which he was one of the first to advocate measures for protecting workers in factories against accidents from machinery. In 1823 he published his first volume of verse, Poetical Sketches, and in 1824 he became the editor of the Literary Souvenir, of which he also became the proprietor two years later, and in the conduct of which he secured the co-operation of some of the most famous men of letters of the period. In 1825 he went to Manchester as editor of the Manchester Courier, a position which he resigned a year later; in 1828 he assisted in founding the Edinburgh Standard, and in 1834 his editor was Stanley Lees Giffard; and in 1835 he started the United Service Gazette, which he edited for several years. Watts was also interested in a number of provincial Conservative newspapers which were not financially successful, and he became bankrupt in 1850, but was awarded a civil service pension by Lord Aberdeen in 1854. In 1856 he edited the first edition of Men of the Time. Watts died in London on the 5th of April 1856. In 1867 a collection of his poems was published in a volume entitled The Laurel and the Lyre.

Watts, George Frederic (1817-1904), English painter and sculptor, was born in London on the 3rd of February 1817. While hardly more than a boy he was permitted to enter the schools of the Royal Academy; but his attendance was short-lived, and his further art education was confined to personal experiment and endeavour, guided and corrected by a constant appeal to the standard of ancient Greek sculpture. There are portraits of himself, painted in 1834; of Mr James Weale, about 1835; of his father, "Little Miss Hopkins," and Mr Richard Jarvis, painted in 1836; and in 1837 he was a paper far enough advanced to be an exhibitor at the Academy with a picture of "The Wounded Heron" and two portraits. His first exhibited figure-subject, "Cavaliers," appeared on the Academy walls in 1839, and was followed in 1840 by "Isabella e Lorenzo," in 1841 by "How should I your true love know?" and in 1842 by a scene from Cymbeline and a portrait of Mrs Ionides. The Royal Commission appointed for the decoration of the new Houses of Parliament offered prizes in 1842 to those artists whose cartoons for frescoes should be adjudged best adapted to its object, and at the exhibition in Westminster Hall next year Watts secured a prize of £500 for a design of "Caractacus led in triumph through the streets of Rome." This enabled him to visit Italy in 1844, and he remained there during the greater portion of the three following years, for the most part in Florence, where he enjoyed the patronage and personal friendship of Lord Holland, the British ambassador. For him he painted a portrait of Lady Holland, exhibited in 1848, and in his Villa Careggi, near the city, a fresco, after making some experimental studies in that medium, fragments of which are now in the Victoria and Albert Museum. To Lord Holland's encouragement, also, it was chiefly due that in 1846 the British Association, the technical body of the Royal Commissioners, who on this occasion announced a further list of prizes for works in oil. Watts sent in a cartoon depicting "Alfred inciting his subjects to prevent the landing of the Danes, or the first naval victory of the English," which, after obtaining a first-class prize of £500 at the exhibition in Westminster Hall, was purchased by the government, and hangs in one of the committee rooms of the House of Commons. It led, moreover, to a commission for the fresco of "St George overcomes the Dragon," which, begun in 1848 and finished in 1853, forms part of the decoration of the third chamber of the House of Lords. Watts prepared the fresco "The Progress of the Cosmos," but the offer was refused. A similar proposition made shortly afterwards to the Bunchers of Lincoln's Inn was received in a less commercial spirit, and was followed by the execution of the fresco, "Justice: a Hecemile of Lawgivers," on the north side of their hall.

While this large undertaking was still in progress, Watts was working steadily at pictures and portraits. In 1849 the two of the great allegorical compositions which form the most characteristic of the artist's productions were exhibited—"Life's Illusions," an elaborate personification of the vanity of human desires, and "The people that sat in darkness," turning eagerly towards the growing dawn. In 1850 he first gave public expression to his intense longing to improve the condition of humanity in the picture of "The Good Samaritan" bending over the wounded traveller; this, as recorded in the catalogue of the Royal Academy, was "painted as an expression of the artist's admiration and respect for the noble philanthropy of Thomas Wright, of Manchester," to that city he presented the work, in full Academy membership, in 1851. Watts made a visit to Lord Holland at Paris, where he was then ambassador, and through him made the acquaintance and painted the portraits of Thiers, Prince Jerome Bonaparte and other famous Frenchmen; while other celebrities to whom he sat during these years were Guizot (1848), Colonel Rawlinson, C.B., Sir Henry Taylor and Thomas Wright (1851), Lord John Russell (1852), Tennyson (1856, and again in 1859), John Lothrop Motley the historian (1859), the duke of Argyll (1860), Lord Lawrance and Lord Lyndhurst (1862), Lord Wensleydale (1864), Mr Gladstone (1858 and 1865), Sir William Bowman and Swithin (1865), Panizzi (1866) and Dean Stanley and Dr Joachim in 1867. Notable pictures of the same period are "Sir Galahad" (1862), "Ariadne in Naxos" (1863), "Time and Oblivion" (1864), originally designed for sculpture to be carried out "in divers materials after the manner of Phidias," and "Thetis" (1866).

In spite of these and many other evidences of his importance, it was not until 1867 that Watts was elected an Associate of the Royal Academy, but the council then conferred upon him the rare distinction of promoting him, in the course of the same year, to full Academic Fellowship. Thenceforward he continued to exhibit each year, with a few exceptions, at the Academy, even after his retirement in 1896, and he was also a frequent contributor to the Grosvenor Gallery, and subsequently to the New Gallery, at which a special exhibition of his works was held in the winter of 1896-1897. Though he travelled abroad to some extent, going to Asia Minor in 1857 with the expedition sent to investigate the ruins of Halicarnassus, and visiting in later years Italy, Greece and Egypt, the greater part of his life was passed in the laborious seclusion of his studio either at Little Holland House, Melsbury Road, Kensington, where he settled in 1859, or in the
country at Limmereside, Compton, Surrey. Apart from his art, his life was happily uneventful, the sole facts necessary to record his being married in 1886 with Miss Mary Fraser-Yetter, an early union with Miss Ellen Terry having been dissolved many years before (1871), but remaining afterwards, despite the offer of a baronetcy; and his inclusion in June 1902 in the newly founded Order of Merit. He died on the 1st of July 1904.

The world is exceptionally well provided with opportunities of judging the qualities of G. F. Watts's art, for with a noble generosity the artist allowed the book of his works to be published at the best work of his long life. A prominent element in it, and one which must prove of the greatest value to posterity, is the inestimable series of portraits of his distinguished contemporaries, a series no one else has ever attempted. A glance through the list of his subjects shows the breadth of his sympathies and his superiority to creep or part. Among politicians are the duke of Devonshire (1883), Lords Salisbury (1884), Sherbrooke (1882), Campbell (1882), Cowper (1877), Ripon (1860), Dufferin (1867) and Shaftesbury (1882), Mr Gerald Balfour (1880) and Mr John Burns (1897), poets—Tennyson, Swinburne (1882), Browning (1875), Matthew Arnold (1881), Rossetti (1885, and eleven others), Lord Leighton (1871 and 1881), Calderon (1872), Princep (1872), Burns-Jones (1870), Millais (1871), Walter Crane (1875), and a host of less important figures. Again, in art, there are Stuart Mill (exhibited 1874), Carlyle (1860), George Meredith (1863), Max Müller (1895) and Mr Lecky (1876); music, by Sir Charles Hallé (1878); and Science, by Sir Joseph Larmor (1896), and the editors are Lords Napier (1886) and Roberts (1890). General Baden-Powell (1902), Garibaldi, Sir Richard Burton (1882), Cardinal Manning (1882), Dr Martineau (1874), Sir Andrew Clark (1894), George Fenn (chosen a member for the first time in 1894) and many others.

There are not wanting critics who radically dissent from this view of the primary functions of art. It must be admitted that there is force in their objection when the inner meaning of a picture is found to be exceedingly obscure, if not incomprehensible, without a verbal explanation. In the female figure, for instance, bending blindfolded on the globe suspended in space and sounding the siren string under the wings of a scythe, as might be surmised from the title bore that is being given to the picture, it is not obvious to every one that the idea of "Hope" (1885) suggested. There can be few, nevertheless, who will maintain that his aim is not a lofty one; and the strongest evidence of the artist's genuine sincerity is that, in his later works, he has not only striven unrigorously for his ideals, but has very clearly attained. Moreover, in so doing he has not failed on occasion to impart to his work much of that very charm which is to him and cruelty that he dwells, but the pity of it that he typifies in "Dedication" or "The Shuddering Angel" (1892) weeping over the altar stand with Woman's spoils.

Yet it is as a teacher that the artist is seen at his highest: he would sooner point out the true way to those who seek it than to diminish those who have wandered. He never weary of emphasizing the reality of the power of Love, the fallacy underlying the fear of Death. To the early masters Death was a bare and ghastly Apparition, about which could only be said that it was an impressive figure, and not but horrible, irresistible but not ruthless, a bringer of rest and peace, not to be rashly sought but to be welcomed when the inevitable hour shall strike. Watts, as he did in his tragic "Jonah" (1868), and in the grand, impressive figure, with undying but not horrible, irresistible but not ruthless, a bringer of rest and peace, not to be rashly sought but to be welcomed when the inevitable hour shall strike. Watts, as he did in his tragic "Jonah" (1868), and in the

WATTS, Isaac (1674-1748), English theologian and hymn writer, son of a clothier, was born at Southampton on the 17th of July 1674. The father, who afterwards had a boarding-school at Southampton, also wrote poetry, and a number of his pieces were included by mistake in vol. i. of the son's Posthumous Works. Isaac Watts is stated to have begun to learn Latin when only in his fifth year, and at the age of seven or eight to have composed some devotional pieces to please his mother. After he left school he was instructed in modern languages and classic literature at universities, but in his sixteenth year he went to study at the nonconformist academy at Stoke Newington, of which the Rev. Thomas Rowe, minister of the Independent meeting at Girdler's Hall, was then president. On leaving the academy he spent more than two years at home, and began to write his hymns, but in the autumn of 1696 he became tutor in the family of Sir John Hoptart at Stoke Newington, where he probably prepared the materials of his two educational works—Logic, or the Right Use of Reason in the Enquiry after Truth (1723), and The Knowledge of the Heavens and the Earth made easy, the First Principles of Geography and Astronomical Explained (1726). In his twenty-fourth year Watts was chosen assistant to Dr Isaac Chauncy (1632-1712), pastor of the Independent congregation in Mark Lane, London, and two years later he succeeded as sole pastor. The state of his health, which he had injured by overwork, led to the appointment of an assistant in 1703. In 1704 the congregation removed to Pinner's Hall, and in 1708 they built a new meeting-house in Bury Street. In 1712 Watts was attacked by fever, which incapacitated him for four years from the performance of his duties. In 1712 he went to live with Sir Thomas Powel of London, by whom he was appointed nonconformist chaplain, the arrangement being continued by Lady Abney after her husband's death. Watts preached only occasionally, devoting his leisure chiefly to the writing of hymns (see HYMNS), the preparation of his sermons for publication, and the composition of theological work. In 1706 appeared his Horse Lyrics, of which an edition with memoir by Robert Southey forms vol. ix. of Sacred Classics (1834); in 1707 a volume of HYMNS; in 1719 The Psalms of David; and in 1720 Divine and Moral Songs for Children. His Psalms are free paraphrases, rather than metrical versions, and some of them ("O God, our help in ages past," for instance) are amongst the most famous hymns in the language. His religious opinions were more liberal in tone than was at that time common in the community to which he belonged; his views regarding Sunday recreation and labour were scarcely of puritanical strictness; and his Calvinism was modified by his rejection of the doctrine of reprobation. He did not hold the doctrine of the Trinity as necessary to salvation, and he wrote several works on the subject in which he developed views not far removed from Arianism. He died on the 25th of November 1748, and was buried at Bunhill Fields, where a tombstone was erected to his memory by Sir John Hoptart and Lady Abney. A memorial was also erected to him in Westminster Abbey, and a memorial hall, erected in his honour at Southampton, was opened in 1875. Among the theological treatises of Watts, in addition to volumes of sermons, are Doctrine of the Trinity (1722); Discourses on the Love of God and its Influence on all the Passions (1727); Essays for Children and Youth (1730); Essays towards a Proof of a Separate State for Souls (1732); Essay on the Freedom of the Will (1732); Essay on the Strength and Weakness of Human Reason (1734); Essay on the Ruin and Recovery of Mankind (1730); Glory of Christ as God-Man Unveiled (1736); and Useful and Important Questions concerning Jesus, the Son of God (1746). He was also the author of a volume of miscellaneous poems, Miscellanies, which was revised and amended in 1774, and a further installment of them in 1779. The Works of ... Isaac Watts (6 vols.), edited by Dr Jennings and Dr Doddridge, with a memoir compiled by G. Burder, appears to be a faithful reproduction of his original editions. His didactic works were included in Isaac's English Poets, where they were accompanied by a Life, and they appear in subsequent similar collections. See also The Life, Times and Correspondence of Isaac Watts (1842).

WATTS-DUNTON, Walter Theodore (1832— ). English man of letters, was born at St Ives, Huntingdon, on the 12th of October 1832, his family surname being Watts, to which he added in 1897 his mother's name of Dunton. He was
originally educated as a naturalist, and saw much of the East Anglian gypsies, of whose superstitions and folk-lore he made careful study. Abandoning his natural history for the law, he qualified as a solicitor and went to London, where he practised for some years, giving his spare time to his chosen pursuit of literature. He contributed regularly to the *Examiner* from 1874 and to the *Athenaeum* from 1875 until 1889, being for more than twenty years the principal critic of poetry in the latter journal. His article on "Poetry" in the ninth edition of the *Encyc. Brit.* (vol. xix., 1885) was the principal expression of his views on the first principles of the subject, and did much to increase his reputation, which was maintained by other articles he wrote for the *Encyclopaedia Britannica* and for other critical periodicals and reviews. Mr. Watts-Dunton had considerable influence as the friend of many of the leading men of letters of his time; he enjoyed the confidence of Tennyson, and contributed an appreciation of him to the authorized biography. He was in later years Rossetti's most intimate friend. He was the bosom friend of Swinburne (q.p.), who shared his home for nearly thirty years before he died in 1909. The obituary notices and appreciations of the poets of the time, which he contributed to the *Athenaeum* and other periodicals, bore testimony to his sympathy, insight and critical acumen. It was not, however, until 1887 that he published a volume under his own name, this being a collection of poems called *The Coming of Love*, portions of which he had printed in periodicals from time to time. In the following year his prose romance *Aylwin* attained immediate success, and ran through many editions in the course of a few months. *Both The Coming of Love and Aylwin* set forth, the one in poetry, the other in prose, the romantic and passionate associations of Romany life, and maintain the traditions of Borrow, whom Mr. Watts-Dunton had known well in his own early days. Imaginative glamour and mysticism are their prominent characteristics, and the novel in particular has its share in restoring and reviving the charms of pure romance to the favour of the general public. He edited George Borrow's Lavengro (1893) and Romany Rye (1900); in 1903 he published *The Renascence of Wonder*, a treatise on the romantic movement; and his Studies of Shakespeare appeared in 1910. But it was not only in his published work that Mr. Watts-Dunton's influence on the literary life of his time was potent. His long and intimate association with Rossetti and Swinburne made him, no doubt, a unique figure in the world of letters; but his own grasp of metrical principle and of the historical perspective of the glory of English poetry made him, as the young writer of fiction, the embodiment of a great tradition of literary criticism which could never cease to command respect. In 1905 he married. His life has been essentially one of devotion to letters, faithfully and disinterestedly followed.

**WAUGH, BENJAMIN** (1839-1908), English social reformer, was born at Settle, Yorkshire, on the 20th of February 1839. He passed the early years of his life in business, but in 1865 entered the congregational ministry. Settling at Greenwich he threw himself with ardour into the work of social reform, devoting himself especially to the cause of the children. He served on the London School Board from 1870 to 1876. In 1884 he was responsible for the establishment of the London society for the prevention of cruelty to children, which several years later was established on a national basis. He was elected its honorary secretary, and it was largely owing to information obtained by him that the Criminal Law Amendment Act of 1885 was passed, while by his personal effort he secured the insertion of a clause giving magistrates power to take the evidence of children too young to understand what was required of them. In 1889 he organized and the work accomplished by his society (of which he had been made director the same year) recognized by the passing of an act for the prevention of cruelty to children, the first stepping-stone to the act of 1908 (see CHILDREN, LAW RELATING TO). In 1895 a charter of incorporation was conferred on the society, but in 1897 it was the object of a serious attack on its administration. An inquiry was demanded by Waugh, and the commission of inquiry, which included Lord Herschell and others, completely vindicated the society and its director. Waugh had given up pastoral work in 1887 to devote his whole time to the society, and he retained his post as director until 1905, when the state of his health compelled his retirement. He remained consulting director until his death at Westcliff, near Southend, Essex, on the 11th of March 1908. Waugh edited the *Sunday Magazine* from 1874 to 1896, but he had otherwise little leisure for literary work. His *The Good Cradle, who rocks it?* (1873) was a plea for the abolition of juvenile imprisonment.

**WAUGH, EDWIN** (1817-1890), known as "The Lancashire Poet," was born at Rochdale, on the 29th of January 1817, the son of a shoemaker. For several years he earned his living as a printer (in various parts of the country). In 1855 he published his first book, *Sketches of Lancashire Life and Localities*, following this up with reprinted *Poems and Songs* (1859). His rendering of the Lancashire dialect was most happy, and his rude lyrics, full of humour and pathos, were great favourites with his countrymen. He died on the 30th of April 1890.

See Milner's *Memoir* in an edition of Waugh's selected works (1892-1893).

**WAUGERAN, a city and the county-seat of Lake county, Illinois, U.S.A., on the W. shore of Lake Michigan, about 56 m. N. of Chicago. Pop. (1900) 10,024; (1910) 13,026, of whom 250 were foreign-born; (1910) census) 16,669. It is served by the Elgin, Joliet & Eastern (of which it is a terminus) and the Chicago & North Western railways, by an interurban electric line, and by lake steamers. In 1886 the United States government undertook the formation of an artificial harbour with a channel 13 ft. deep, and in 1902-1904 the depth was increased to 20 ft. The main portion of the city is situated about 100 ft. above the level of the lake. There are a number of parks and mineral springs, and along the lake front a fine drive-way, Sheridan Road. The city is a resort suburb of Chicago. The principal buildings are the Federal building, the Court House, a Carnegie library, the Masonic Temple and McAlister Hospital. The village of North Chicago (pop. in 1910, 3506), about 3 m. S. of Waukegan, there is a United States Naval Training Station. Waukegan is the commercial centre of an agricultural and dairying region, and has various manufactures. The total value of the factory product in 1905 was $3,661,513. Waukegan was settled about 1835, and until 1849 was known as Little Fort, which is supposed to be the English equivalent of the Indian name Waukegan. It became the county seat. A branch of the Chicago, Milwaukee & St. Paul railway is connected at a town in 1849, and first chartered as a city in 1859.

**WAUKESHA, a city and the county-seat of Waukesha county, Wisconsin, U.S.A., about 19 m. W. of Milwaukee on the Little Fox river. Pop. (1890) 6121; (1900) 7419, including 1408 foreign-born; (1905 state census) 6049; (1910) 8740. Waukesha is served by the Minneapolis, St. Paul & Sault Ste Marie, the Chicago & North-Western and the Chicago, Milwaukee & St Paul railways, and by interurban electric railways connecting it with Milwaukee, Oconomowoc and Madison. The medicinal mineral springs (Bethesda, White Rock, &c.) are widely known. Among the public buildings are the county court house and the public library. Waukesha is the seat of the State Industrial School for Boys (established as a house of refuge in 1860) and of Carroll College (Presbyterian, co-educational, 1846). Waukesha was first settled in 1834, was named Prairieville in 1839, was incorporated as a village under its present name (said to be a Pottawatomie word meaning "fox") in 1852, and chartered as a city in 1866. In 1851 the first railway in the state was completed between Milwaukee and Waukesha, but the village retained only a farming community until the exploitation of the mineral springs was begun about 1868. About 15 m. S. of Waukesha, near Mukwonago (pop. in 1910, 615), in 1843-1845, there was an unsuccessful communist agricultural settlement, the Utilitarian Association, composed largely of London mechanics led by Campbell Smith, a London bookbinder.

**WAURIN** (or WAVRIN), JEAN (or JEAN DE) (d. c. 1474), French chronicler, belonged to a noble family of Artois, and was present at the battle of Agincourt. Afterwards he fought for
the Burgundians at Verneuil and elsewhere, and then occupying a high position at the court of Philip the Good, duke of Burgundy, was sent as ambassador to Rome in 1463. Jehan wrote, or rather compiled, the *Recueil des chroniques et anciennes histoires de la Grand Bretagne*, a collection of the sources of English history from the earliest times to 1471. For this work he borrowed from Froissart, Monstrelet and others; but for the period between 1344 and 1471 the *Recueil* is original and valuable, although somewhat untrustworthy with regard to affairs in England itself.

From the beginning to 688 and again from 1399 to 1471 the text has been edited for the Rolls Series (5 vols., London, 1864–1891), by W. and E. L. C. Hardy, who have also translated the greater part of it into English. The sections from 1325 to 1471 have been edited by L. E. M. Dupont (Paris, 1858–1863).

**WAUSAU**, a city and the county-seat of Marathon county, Wisconsin, U.S.A., on both banks of the Wisconsin river, about 185 m. N.W. of Milwaukee. Pop. (1890) 9253; (1900) 12,354, of whom 3747 were foreign-born; (1910 census) 16,560. There is a large German element in the population, and two German semi-weekly newspapers are published here. Wausau is served by the Chicago, Milwaukee & St Paul and the Chicago & North-Western railways. The city is built for the most part on a level plateau above the river and extends to the top of high bluffs on either side. It has a fine city hall, a Carnegie library, the Marathon County Court House, a hospital, built by the Sisters of the Divine Saviour, and a Federal Building. In Wausau are a U.S. land office, the Marathon County Training School for Teachers, the Marathon County School of Agriculture and Domestic Science, and a County Asylum for the Chronic Insane. Water-power furnished by the Big Bull Falls of the Wisconsin (in the city) is utilized for manufacturing, and in 1910 water-power sites were being developed on the Wisconsin river immediately above and below the city. In 1905 the factory products were valued at $4,644,457. Wausau had its origin in a logging-camp, established about 1838. In 1840 a saw-mill was built here, and in 1858 the village was incorporated under its present name. After 1880, when Wausau was chartered as a city, its growth was rapid.

**WAUTERS, EMILE** (1848– ), Belgian painter, was born in Brussels, 1848. Successively the pupil of Portals and Gerône, he produced in 1868 "The Battle of Hastings: the Finding of the body of Harold by Edith," a work of striking, precocious talent. A journey was made to Italy, but that the study of the old masters in no wise affected his individuality was proved by "The Great Wave of St Mark's" (purchased by the king of the Belgians). As his youth disqualified him for the medal of the Brussels Salon, which otherwise would have been his, he was sent, by way of compensation, by the minister of fine arts, as artist-delegate to Suez for the opening of the canal, a visit that was fruitful later on. In 1870, when he was yet only twenty-two years of age, Wauters exhibited his great historical picture of "Mary of Burgundy entreating the Sheriffs of Ghent to pardon the Councillors Hugonet and Humbercourt" (Liège Museum) which created a veritable furor, an impression which was confirmed the following year at the London International Exhibition. It was eclipsed by the celebrated "Madness of Hugo van der Goes" (1872, Brussels Museum), a picture which led to the commission for the two large works in which the lions' staircase of the Hotel de Ville, Mary of Burgundy swearing to respect the Communal Rights of Brussels, 1877, and "The Armed Citizens of Brussels demanding the Charter from Duke John IV. of Brabant." His other large compositions comprise "Sobieski and his Staff before Besieged Vienna" (Brussels Museum) and the harvest of a journey to Spain and Tanger, "The Great Mosque," and "Serpent Charmers of Sokko," and a souvenir of his Egyptian travel, "Cairo, from the Bridge of Kasr-el-Nil" (Antwerp Museum). His vast panoply —probably the noblest and most artistic work of this class ever produced—"Cairo and the Banks of the Nile" (1881), 580 ft. by 49 ft., was to the highest honor of the artist's extraordinary success in Brussels, Munich, and the Hague. Wauters is equally eminent as a portraitist, in his earliest period exhibiting, as in his pictures, sober qualities and subtle grip, but later on developing into the whole range of a brilliant, forceful palette, and then into brighter and more delicate colours, encouraged thereto, in his more recent work, by his adoption of pastel as a medium even for life-size portraits, mainly of ladies. His portraits, numbering over two hundred, include many of the greatest names in Belgium, France, and America (Wauters having for some years made Paris his chief home). Among these may be named the Baron Golfinet, the Baroness Goëffnet, Madame Somzée (standing at a piano), Master Somzée (on horseback by the sea-shore), the Princess Clementine of Belgium (Brussels Museum), Lady Edward Sassoon, Baron de Bleichroder, Princess de Ligne, Miss Lorillard, a likeness of the artist in the Dresden Museum, and M. Schollaert (president of the Chamber of Deputies) —the last named an amazing example of portraiture, instinct with character and vitality. The vigour of his male, and the grace and elegance of his female, portraits are unsurpassable, the resemblance perfect and the technical execution such as to place the artist in the front rank. Between 1889 and 1900 the painter contributed to the Royal Academy of London. Few artists have received such a succession of noteworthy distinctions and recognitions. His "Hugo van der Goes," the work of a youth of twenty-four, secured the grand medal of the Salon. He has been awarded no fewer than six "medals of honour"—at Paris in 1878 and 1889; Munich, 1879; Antwerp, 1885; Vienna, 1888; and Berlin, 1893. He is a member of the academy of Belgium, and honorary member of the Vienna, Berlin, and Munich academies, and corresponding member of the Institut de France and of that of Madrid. He has received the order of merit of Prusia, and is Commander of the order of Léopold, and of that of St Michael of Bavaria, officer of the Legion of Honour, &c.

**WAVERLEY.** It is not altogether easy to frame a definition which shall be precise and at the same time cover the various physical phenomena to which the term "wave" is commonly applied. Speaking generally, we may say that it denotes a process in which a particular state is continually handed on without change, or with only gradual change, from one part of a medium to another. The most familiar instance is that of the waves which are observed to travel over the surface of water in consequence of a local disturbance; but, although this has suggested the name 1 since applied to all analogous phenomena, it so happens that water-waves are far from affording the simplest instance of the class in question. But the principal types of wave-motion which present themselves in physics are reviewed in the order of their complexity. Only the leading features are as a rule touched upon, the reader being referred to other articles for such developments as are of interest mainly from the point of view of special subjects. The theory of water-waves, on the other hand, will be treated in some detail.

§ 1. Wave-Propagation in One Dimension.

The simplest and most easily apprehended case of wave-motion is that of the transverse vibrations of a uniform tense string. The axis of $x$ being taken along the length of the string in its undisturbed state, and the wave described as a function of $x$ and $t$. This is assumed to be infinitely small; the resultant lateral force on any portion of the string is then equal to the tension $P$ say multiplied by the total curvature of that portion, and therefore in the case of an element $dx$ to $Py^2dx$, where the accents denote differences with respect to $x$. Equating this to $p\rho\frac{dy}{dx}$, where $\rho$ is the line-density, we have

\[ m\frac{dy}{dx} + cy = 0 \]

where

\[ m = \rho \cdot \frac{d^2}{dt^2} \]

\[ c = \sqrt{\frac{P}{\rho}} \]

1 The word "wave," as a substantive, is late in English, not occurring till the Bible of 1551 (Skeat, *Etym. Dict.*, 1910). The proper O. Eng. word was *wae*, which became *wære* in M. Eng.; it is cognate with Ger. *Woge*, and is allied to "wag," to move from side to side, and is to be referred to the root *weh* or *wegh*, "to wave," &c. The O. Eng. *wafan*, M. Eng. *ware*, to fluctuate, to wave in mind, cf. *wære*, restless, is cognate with M. H.G. *walen*, to move to and fro, cf. Eng. *waddle* of which the ultimate root is seen in "whip," and in "quaver."
The general solution of (1) was given by J. le R. d’Alembert in 1747; it is
\[ y = f(x-t) + F(x+t), \]
where the functions \( f \) and \( F \) are arbitrary. The first term is unaltered in value when \( x \) and \( t \) are increased by equal amounts; hence this term, taken by itself, represents a wave-form which is propagated without change in the direction of \( z \)-progression, with the constant velocity \( c \), like manner a wave-form travelling with the same velocity in the direction of \( x \)-negative; and the most general free motion of the string consists of two such wave-forms superposed. In the case of an initial disturbance confined to a finite portion of an unlimited string, the motion finally resolves itself into two waves travelling in opposite directions. In these separate waves we have
\[ y = f(x-t), \]
as appears from (3), or from simple geometrical considerations. It is to be noticed, in this as in all analogous cases, that the wave-velocity appears as the square root of the ratio of two quantities, one of which represents (in a generalized sense) the elasticity of the medium, and the other its inertia.

The expressions for the kinetic and potential energies of any portion of the string are
\[ T = \frac{1}{2} \rho f'^2 dx, \]
where the integrations extend over the portion considered. The relation (4) shows that in a single progressive wave the total energy is half kinetic and half potential.

When a point of the string (say the origin \( O \)) is fixed, the solution takes the form
\[ y = \phi(x-t) = f(x-t), \]
As applied (for instance) to the portion of the string to the left of the origin, this indicates the superposition of a reflected wave represented by the second term on the direct wave represented by the first.

The velocity \( c \). The second term represents the corresponding points as the incident wave, as is indeed required by the principle of energy, but its sign is reversed.

The reflection of waves at a free boundary, and at the junction of two strings of unequal density \( \rho_1 \) and \( \rho_2 \), is of interest on account of the optical analogy. If \( A, B \) are the ratios of the amplitudes in the reflected and transmitted waves, respectively, to the corresponding amplitudes in the incident wave, it is found that
\[ A = (\frac{\rho_1}{\rho_2} + 1) (\frac{\rho_1}{\rho_2} - 1), \]
where \( \rho_1 = \sqrt{\phi(\rho_2)} \), is the ratio of the wave-velocities. This is on the hypothesis of an abrupt change of density; if the transition be gradual there may be little or no reflection.

The theory of waves of longitudinal vibration in a uniform straight rod follows exactly the same lines. If \( \ell \) denote the displacement of a particle whose undisturbed position is \( x \), the length of an element of the central line is altered from \( \ell x \) to \( \ell x + \ell \), and the elongation is therefore measured by \( \ell \). The tension across any section is accordingly \( E\ell \omega \), where \( \omega \) is the sectional area, and \( E \) denotes Young’s modulus for the material of the rod (see Elasticity). The rate of change of momentum of the vibrations included between any two consecutive sections is \( \rho \ell \omega \dot{\ell} \), where \( \rho \) now stands for the volume-density. Equating this to the difference of the tensions on these sections we obtain
\[ \ddot{\ell} = \gamma \ell \phi(\ell), \]
where
\[ \gamma = \sqrt{\ell \phi(\ell)}. \]
The solution and the interpretation are the same as in the case of (1). It may be noted that in an iron or steel rod the wave-velocity given by (6) amounts roughly to about five kilometres per second.

The theory of plane elastic waves in an unlimited medium, whether fluid or solid, leads to differential equations of exactly the same type. Thus in the case of a fluid medium, if the displacement \( \zeta \) normal to the wave-fronts be a function of \( t \) and \( x \), only, the equation of motion of a thin stratum initially bounded by the planes \( x \) and \( x + \delta x \) is
\[ \frac{d^2 \zeta}{dt^2} = \frac{\delta p}{\rho_0 \delta x}, \]
where \( p \) is the pressure, and \( \rho_0 \) the undisturbed density. If \( p \) depends only on the density, we may write, for small disturbances,
\[ p = p_0 + k \zeta, \]
where \( k = (\rho \phi(p_0) \rho_0) \), the “condensation,” and \( k \) is the coefficient of cubic elasticity. Since \( \dot{\zeta} = \delta x \phi(\dot{\zeta}), \) this leads to
\[ \frac{d^2 \zeta}{dt^2} = \gamma \phi(\zeta), \]
with
\[ \gamma = \sqrt{\ell \phi(\ell)}. \]

The latter form gives for the velocity of sound in water a value (about 1450 metres per second at 15°C) which is in good agreement with direct observation. In the case of a gas, if we neglect variations of temperature, we have \( k = p_0 \) by Boyle’s Law, and therefore \( \gamma = \sqrt{\ell p_0}, \) which gives, however, a value considerably below the true velocity of sound. The discrepancy was explained by P. S. Laplace (about 1806). The temperature is not really constant, but rises and falls as the gas is alternately compressed and rarefied. When this is allowed for we have \( k = \gamma \rho_0 \), where \( \gamma \) is the ratio of the two specific heats of the gas, and therefore \( \gamma = \sqrt{\ell \rho_0}, \) for air, \( \gamma = 1.41, \) and the consequent value of \( \gamma \) is still the best direct determinations (332 metres per second at 0°C). The potential energy of a system of sound waves is \( \frac{1}{2} \lambda \delta \lambda \), per unit volume. As in all cases of propagation in one dimension, the energy is propagated in half kinetic and half potential energy.

In the case of an unlimited isotropic elastic solid medium two types of plane waves are possible, viz., the displacement may be normal or tangential to the wave-fronts. The axis of \( z \) being taken in the direction of the propagation of the waves in the case of a normal displacement \( \delta \) the equation normal to the wave-front is \( \lambda x + 2\mu \delta y + \delta x \), where \( \lambda, \mu \) are the elastic constants of the medium, \( \mu \) is the rigidity, \( \lambda = k^2 - 4\mu, \) where \( k \) is the cubic elasticity. This leads to the equation
\[ \xi = \phi(\xi), \]
where
\[ a = \sqrt{\lambda + 2\mu}/\rho, \]
with
\[ b = \mu/\rho. \]
The wave-velocity is greater than in the case of the longitudinal vibration of a rod, owing to the lateral yielding which takes place in the latter case. In the case of a displacement \( \eta \) parallel to the axis of \( y \), and therefore tangential to the wave-fronts, we have a shearing strain \( \eta y / \dot{x} \), and a corresponding shearing stress \( \rho \mu / \dot{x} \).

This leads to
\[ \eta = \phi(\eta), \]
with
\[ b = \mu/\rho. \]
In the case of steel \( k = 1.841 \), 10\(^3\), \( \mu \approx 8.19 \), 10\(^3\), \( \rho = 8.49 \) C.G.S.S. the wave-velocities \( a, b \) come out to be 6.14 and 3.2 kilometres per second respectively.

If the medium be crystalline the velocity of propagation of plane waves will depend also on the wave-front. For any given direction of the wave-normal there are in the most general case three distinct velocities of wave-propagation, each with its own direction of particle-vibration. These latter directions are perpendicular to each other, but in general oblique to the wave-front. For certain types of wave the distinction is not of importance, but it is necessary to enter into further details, as the matter is chiefly of interest in relation to the now abandoned elastic-solid theories of double-refraction. For the modern electric theory of light, heat, and Electric Waves.

Finally, it may be noticed that the conditions of wave-propagation without change of type may be investigated in another manner. If we impress on the whole medium a velocity equal and opposite to that of the wave, we obtain a steady or “stationary” state, in which the circumstances at any particular point of space are constant. Thus in the case of the vibrations of an inextensible string we may, for instance, imagine the string to run through the results stated above and have converted the wave-form into a uniform state, so that the velocity of the wave is constant there is no tangential acceleration, and the tension \( p \) is accordingly uniform. The resultant of the tensions on the two ends of an element \( \delta x \) is \( p \delta \ell / \ell \), in the direction of the normal, where \( \ell \) denotes the radius of curvature. This will be exactly sufficient to produce the normal acceleration \( \gamma / \ell \) in the mass \( \rho \delta x \), provided \( \gamma / \ell \) is exact. Under this condition the tube, which now exerts no pressure on the structure, may be abolished, and we have a free stationary wave on a moving string. This argument is due to P. G. Tait.

The method was applied to the case of Air waves by W. J. Month. In 1870, when a gas flows steadily through a straight tube of unit section, the mass \( m \) which crosses any section in unit time must be the same; hence if \( u \) be the velocity we have
\[ \rho u = m. \]

Combining with (18) this gives
\[ \rho u = m = \rho v \ell (u - v). \]
Hence for absolutely steady motion it is essential that the expression \( \rho v / \ell \) should have the same value throughout the tube. This condition is not accurately fulfilled by any known substance, whether subject to the “isothermal” or “adiabatic” condition; but in the case of small variations of pressure and density the relation is equivalent to
\[ m^2 = \rho u / (m - m_0), \]
and therefore by (18), if \( c \) denote the general velocity of the current,
\[ c^2 = \rho u / m, \]
in agreement with (13). The fact that the condition (20) can only be satisfied approximately shows that some progressive change of type must inevitably take place in sound-waves of finite amplitude.
the more condensed portions of the wave gain continually on the less condensed, the tendency being apparently towards the production of a condensed and erected portmoneous to a "bore" in water-waves. Before this stage can be reached, however, dissipative forces (so far ignored), such as viscosity and thermal conduction, come into play, and practical acoustics the results are also modified by the diminution of amplitude due to spherical divergence.

§ 2. Wave-Propagation in General.

We have next to consider the processes of wave-propagation in two or three dimensions. The simplest case is that of air-waves. When terms of the second order in the velocities are neglected, the dynamical equations are

\[ \rho \frac{\partial u}{\partial t} - \frac{\partial p}{\partial x} = \frac{\partial \rho}{\partial x} \frac{\partial u}{\partial x} - \frac{\partial \rho}{\partial y} \frac{\partial u}{\partial y} = -\frac{\partial \dot{p}}{\partial x}, \]

and the "equation of continuity" (see HYDROMECHANICS) is

\[ \frac{\partial p}{\partial x} + \rho \frac{\partial u}{\partial x} + \frac{\partial \rho}{\partial y} \frac{\partial u}{\partial y} = 0. \]

If we write \( p = p_0(t+s) \), \( p = p_0 + \Delta p \), these may be written

\[ \frac{\partial s}{\partial t} - c^2 \frac{\partial s}{\partial x} = -\frac{\partial \Delta p}{\partial x}, \]

where \( c \) is given by \( \sqrt{1 + \rho_0 u_0} \), and

\[ \frac{\partial^2 s}{\partial x^2} - c^2 \frac{\partial^2 s}{\partial t^2} = \frac{\partial \Delta p}{\partial x}, \]

the latter equation expressing that the condensation \( s \) is diminishing at a rate equal to the "divergence" of the vector \((u, v, w)\) (see VECTOR ANALYSIS). Eliminating \( u, v, w, \) we obtain

\[ \frac{\partial^2 \varphi}{\partial x^2} + \frac{\partial^2 \varphi}{\partial y^2} = \frac{\partial \Delta p}{\partial x}, \]

where \( \varphi \) stands for Laplace's operator \( \partial^2 \varphi/\partial x^2 + \partial^2 \varphi/\partial y^2 + \partial^2 \varphi/\partial z^2 \).

This, the general equation of sound-waves, appears to be due to L. Euler (1759). In the particular case where the disturbance is symmetrical with respect to a centre \( O \), it takes the simpler form

\[ \frac{\partial^2 \varphi}{\partial r^2} = \frac{\partial \Delta p}{\partial r}, \]

where \( r \) denotes distance from \( O \). It is easily deduced from (1) that in the case of a medium initially at rest the velocity \( (u, v, w) \) is now wholly radial. The solution of (6) is

\[ s = \int \frac{F(t-r)}{r} + F(t+r) \frac{dr}{r} \]

This represents two spherical waves travelling outwards and inwards, respectively, with the velocity \( c \), but there is now a progressive change of amplitude. Thus in the case of the diverging wave represented by the first term, the condensation in any particular part of the wave continually diminishes as \( 1/r \) as the wave spreads. The potential energy per unit volume \( \rho \) varies as \( s^2 \), and so diminishes in inverse proportion to the square of the distance from \( O \). It may be shown that in the case of plane waves the total energy of a diverging \( ( \text{or a converging) } \) wave is half potential and half kinetic.

The solution of the general equation (5), first given by S. D. Poisson in 1819, expresses the value of \( s \) at any given point \( P \) at time \( t \), in terms of the mean values of \( s \) and \( t \) at the instant \( t = 0 \) over a spherical surface of radius \( r \) described with \( P \) as centre, viz.

\[ s = \int \frac{F(t-r)}{4\pi r} + F(t+r) \frac{dr}{4\pi r} \int F(t-r) \frac{dr}{r}, \]

where the integrals extend over the surface of the aforesaid sphere, \( dw \) is the solid angle subtended at \( P \) by an element of its surface, and \( F(t) \) \( F(t) \) respectively denote the original values of \( s \) and \( t \) at the position of the element. Hence, if the disturbance be originally confined to a limited region, the agitation at any point \( P \) external to this region will begin at a time \( r/t \) and will cease after a time \( 2r/t \), where \( r \) is the least and greatest distances of \( P \) from the boundary of the region in question. The region occupied by the disturbance at any instant \( t \) is therefore delimited by the envelope of a family of spheres of radius \( r \) described with the points of the original boundary as centres.

One remarkable point about waves diverging in three dimensions remains to be noticed. It easily appears from (5) that the value of the integral \( s \) at any point \( P \), taken over the whole time of transit of a wave, is independent of the position of \( P \), and therefore equal to zero, as is seen by taking \( P \) at an infinite distance from the original seat of disturbance. This shows that a diverging wave necessarily consists of condensations and rarefactions, that if we have zero velocity everywhere, but a uniform condensation \( s \) throughout a spherical space of radius \( a \), it is found that we have ultimately a diverging wave in the form of a spherical shell of thickness \( a \), and that the value of \( s \) within this shell varies from \( s/a \) at the anterior face to \( -s/a \) at the interior face, \( r \) denoting the mean radius of the shell.

The process of wave-propagation in two dimensions offers some peculiarities which are exemplified in cylindrical waves of sound, in waves on a uniform tense plane membrane, and in annular waves on a horizontal sheet of water of (relatively) small depth. The equation of motion in all these cases of the form

\[ \frac{\partial^2 \varphi}{\partial z^2} = \frac{\partial \sigma}{\partial t^2}, \]

where \( \sigma = \partial^2 \varphi/\partial z^2 + \partial^2 \varphi/\partial y^2 \). In the case of the membrane \( s \) denotes the displacement normal to its plane; in the application to water-waves it represents the elevation of the surface above the undisturbed level. The solution of (9), even in the case of symmetry about the origin, is analytically much simpler than that of (6). It appears that the wave due to a transient local disturbance, even of the simplest type, is now not developed directly to the rear, as it is in the front, but has an indefinitely prolonged "tail." This is illustrated by the annexed figures which represent graphically a diminution of energy in the condensation \( s \) at a particular point, as a wave originating in a local condensation passes over this point. The curve \( A \) represents (in a typical case) the effect of a plane wave, \( B \) that of a cylindrical wave, and \( C \) that of a spherical wave. The changes of type from \( A \) to \( B \) and from \( B \) to \( C \) are accounted for by the increasing degree of mobility of the medium.

The equations governing the displacements \( u, v, w \) of a uniform elastic isotropic solid medium are

\[ \frac{\partial^2 \varphi}{\partial x^2} + \frac{\partial^2 \varphi}{\partial y^2} + \frac{\partial^2 \varphi}{\partial z^2} = \lambda + \mu \frac{\partial^2 s}{\partial x^2} + \mu \frac{\partial^2 s}{\partial y^2} + \mu \frac{\partial^2 s}{\partial z^2}, \]

where

\[ \sigma = \frac{\partial^2 \varphi}{\partial x^2} + \frac{\partial^2 \varphi}{\partial y^2} + \frac{\partial^2 \varphi}{\partial z^2}, \]

From these we derive by differentiation

\[ \frac{\partial^2 \varphi}{\partial x^2} = b \varphi - \frac{d^2 \varphi}{dt^2}, \quad \frac{\partial^2 \varphi}{\partial y^2} = b \varphi - \frac{d^2 \varphi}{dt^2}, \quad \frac{\partial^2 \varphi}{\partial z^2} = b \varphi - \frac{d^2 \varphi}{dt^2}, \]

and

\[ a^2 = 4\pi (a - 1), b^2 = 4\pi a, \]

as in § 1. It appears then that the "dilatation" \( \Delta \) and the "rotations" \( \xi, \eta, \zeta \) are propagated with the velocities \( a, \xi, \) respectively.

By formulae analogous to (8) we can calculate the values of \( \Delta, \xi, \eta, \zeta \) at any instant in terms of the initial conditions. The subsequent determination of \( u, v, w \) would be merely a dynamical problem into which we do not enter; it is clear, however, that if the original disturbance be confined to a limited region we have ultimately two concentric spherical diverging waves. In the outer one of these, which travels in the velocity \( a^2 \), the wave \( b^2 \) vanishes, and the wave is accordingly described as "irrotational" or "condensational." In the inner wave, which travels with the smaller velocity \( b \), the dilatation \( \Delta \) vanishes, and the wave is therefore characterized as "equiangular" or "distortional." In the former wave the directions of vibration of the particles tend to become normal, and in the latter tangential, to the wave-front, as in the case of plane elastic waves (§ 1).

The problems of reflection and transmission which arise when a wave encounters the boundary of an elastic-solid medium, or the interference of two such media, are of interest chiefly in relation to the older theories of optics. It may, however, be worth while to remark that an irrotational or an equiangular wave does not in general give rise to a reflected (or transmitted) wave of single character; thus an equivalent wave at some section of the boundary of an irrotational as well as an equivular reflected wave, and so on.

Finally, in a limited elastic solid we may also have systems of waves of a different type. These travel over the surface with a definite velocity somewhat higher than that of the equivular waves above referred to; thus in an incompressible solid the velocity \( c = 0 \) in a solid such that \( \lambda = \mu \) it is \( 10\mu \). The agitation due to these waves is confined to the immediate neighbourhood of the wave-front, and is transmitted gradually with increasing depth. The theory of these surface waves was given by Lord Rayleigh in 1885. In the modern theory of earthquakes three phases of the disturbance...
at a station distant from the origin are recognized; the first corresponds to the arrival of condensational waves, the second to that of distortional waves, and the third to that of the Rayleigh waves (see Elasticity).

The theory of waves diverging from a centre in an unlimited crystalline medium has been investigated with a view to optical theory by G. Green (1839), A. L. Cauchy (1830), E. B. Christoffel (1877) and others. The surface which represents the wave-front consists of three sheets, each of which is propagated with its own special velocity. It is hardly worth while to attempt an account here of the singularities of this surface, or of the simplifications which occur for various types of crystalline symmetry; the subject has lost much of its physical interest now that the elastic-solid theory of light is practically abandoned.

The simplest type of water-waves is that in which the motion of the particle is only horizontally, and therefore, as will appear, sensibly the same for all particles in a vertical line. The most conspicuous example is that of the forced oscillations produced by the action of the sun and moon on the waters of the ocean or the sea, and which has therefore been proposed to designate by the term "tide" all cases of wave-motion, whatever their scale, which have the above characteristic property.

The motion of the waves will be treated as a plane wave, and the instantaneous particle motion at a point will be composed of the simple harmonic motion of the free surface, and the horizontal pressure-gradient $dP/dx$ will therefore be independent of $y$. It follows that all particles which at any instant lie in a plane perpendicular to $x$ will retain this relative configuration throughout the motion. The equation of horizontal motion, on the hypothesis that the velocity $u$ is infinitely small, will be

$$\frac{\partial u}{\partial t} + \frac{\partial u}{\partial x} = 0,$$  

where $y$ denotes the surface-elevation at the point $x$. Again, the equation of continuity, viz.,

$$\frac{\partial u}{\partial t} + \frac{\partial v}{\partial y} = 0,$$  

gives

$$v = -\int_{0}^{x} \frac{\partial u}{\partial x} dy,$$  

if the origin be taken at the bottom, the depth being assumed to be uniform. At the surface we have $y = h + u$, and $v = \partial u/\partial t$, subject to an error of the second order in the disturbance. To this degree of approximation we have then

$$\frac{\partial u}{\partial t} = -\frac{\partial u}{\partial x} \frac{\partial u}{\partial t},$$  

If we eliminate $u$ between (1) and (2) we obtain

$$\frac{\partial u}{\partial t} = \frac{\partial u}{\partial x} \frac{\partial u}{\partial y},$$  

with

$$u = gh.$$

The solution is as in § 4, and represents two wave-systems travelling with different vertical velocities $v/(gh)$, which is that which would be acquired by a particle falling freely through a space equal to half the depth.

Two distinct assumptions have been made in the foregoing investigation. The meaning of these is most easily understood if we consider the case of a simple-harmonic train of waves in which

$$\eta = \beta \cos k(x-t), \quad u = \frac{\beta}{c} \cos k(x-t),$$  

where $k$ is a constant such that $2\pi/k$ is the wave-length $\lambda$. The first assumption, viz., that the vertical acceleration may be neglected in comparison with the horizontal, is fulfilled if $kH$ be small, i.e. if the wave-length be large compared with the depth. It is in this sense that the theory is regarded as applicable only to long "waves."

The second assumption, which neglects terms of the second order in forming the equation (1), implies that the ratio $\eta/k$ of the surface-elevation to the depth of the fluid must be small. The formulae (7) indicate also that in a progressive wave a particle moves forwards or backwards according as the water-surface above it is elevated or depressed relatively to the mean level. It may also be proved that the expressions

$$T = \frac{\pi k}{g}, \quad V = \frac{\pi k}{g} \sqrt{g H},$$  

for the kinetic and potential energies per unit breadth are equal in the case of a progressive wave.

It will be noticed that there is a very close correspondence between the theory of "long" water-waves and that of plane waves of sound, e.g., the ratio $\eta/k$ corresponds exactly to the "condensation" in the case of air-waves. The theory can be adapted, with very slight adjustment, to the case of waves propagated along a canal of any uniform section, provided the breadth, as well as the depth, be small compared with the wave-length. The principal change is that in (6) $h$ must be understood to denote the mean depth. The theory was further extended by G. Green (1837) and by Lord Rayleigh to the case where the dimensions of the cross-section are variable. If the wave-length is sufficiently gradual there is no sensible reflection, a progressive wave travelling always with the velocity appropriate to the local mean depth. There is, however, a variation in amplitude; the conservation of energy, combined with the equation of continuity, require that the elevation $\eta$ in any particular part of the wave should vary as $\beta^{-4} k^4$, where $k$ is the breadth of the water surface and $h$ is the mean depth.

Owing to its mathematical simplicity the theory of long waves in canals has been largely used to illustrate the dynamical theory of the tides. In the case of forced waves in a uniform canal, the equation (1) is replaced by

$$\frac{\partial u}{\partial t} = -\frac{\partial u}{\partial x} + Xu,$$  

where $X$ represents the extraneous force. In the case of an equatorial canal surrounding the earth, the disturbing action of the moon, supposed (for simplicity) to revolve in a circular orbit in the plane of the equator, is represented by

$$X = -\frac{\pi H}{a} \sin (2\pi x/a + \phi),$$  

where $\phi$ is the earth's radius, $H$ is the total range of the tide on the equilibrium theory, and $\phi$ is the angular velocity of the moon relative to the rotating earth. The corresponding solution of the equations (4) and (9) is

$$\eta = \frac{\pi H}{a} \frac{\beta}{c} H \cos (2\pi x/a + \phi);$$  

$$u = \frac{\pi H}{a} \frac{\beta}{c} H \cos (2\pi x/a + \phi).$$  

The coefficient in the former of these equations is negative unless the ratio $h/k$ exceeds $\sqrt{c}/a$, which is about 1/311. Hence unless the depth of our imagined canal be much greater than such depths as are actually met with in the sea the tides in it would be inverted, i.e. there would be low water beneath the moon and at the antipodal point, and high water on the meridian distant $90^\circ$ from the moon. This is an instance of a familiar result in the theory of vibrations, viz., that in a forced oscillation of a body under a periodic force the phase is opposite to that of the force if the imposed frequency exceeds that of the corresponding free vibration (see Mechanics). In the present case the period of the free oscillation in an equatorial canal 11,250 ft. deep would be about 30 hours.

When the ratio $\eta/k$ of the elevation to the depth is no longer treated as infinitely small, it is found that a progressive wavesystem must undergo a continual change of type as it proceeds, even in a uniform canal. It was shown by Sir G. B. Airy (1845) that the more elevated portions of the wave travel with the greater velocities, the expression for the velocity of propagation being

$$c \sqrt{1 - k^2}$$

approximately. Hence the slopes will become continually steeper in front and more gradual behind, until a stage is reached at which the vertical acceleration is no longer negligible, and the theory ceases to apply. The process is exemplified by sea-waves running inwards in shallow water near the shore. The theory of forced periodic waves of finite (as distinguished from infinitely small) amplitude was also discussed by Airy. It has an application in tidal theory, in the explanation of "overtides" and "compound tides" (see Tide).

This is the most familiar type of water-waves, but the theory is not altogether elementary. We will suppose in the first instance that the motion is in two dimensions $x$, $y$; horizontal and vertical respectively. The velocity-potential (see Hydrodynamics) must satisfy the equation

$$\frac{\partial \phi}{\partial x} - \frac{\partial \phi}{\partial y} = 0,$$  

and must make $\partial \phi/\partial y = 0$ at the bottom, which is supposed to be plane and horizontal. The pressure-eqioation, is, if we neglect the square of the velocity,

$$\rho \frac{\partial \phi}{\partial t} - \frac{\partial^2 \phi}{\partial x^2} = \text{const.}$$  

Hence, if the origin be taken in the undisturbed surface, we may write, for the surface-elevation,

$$\eta = \frac{\partial \phi}{\partial y} \bigg|_{y=0}$$  

with the same approximation. We have also the geometrical condition

$$\frac{\partial \phi}{\partial y} = -\frac{\partial \eta}{\partial t},$$  

(4)

The general solution of these equations is somewhat complicated,
WAVE

and it is therefore usual to fix attention in the first place on the case of an infinitely extended wave-system of simple-harmonic profile, say

\[ \eta = \beta \sin k(x - ct) \]  

The corresponding value of \( \psi \) is

\[ \phi = \frac{\psi}{\kappa} \cos k(y + h) \cos k(x - ct) \]

(5)

where \( h \) denotes the depth; it is in fact easily verified that this satisfies (1), and makes \( \psi = \beta k \), and that it fulfills the pressure-condition (3) at the free surface. The kinematic condition (4) will also be satisfied, provided

\[ c^2 = \frac{k^2}{\tan h k h} - \frac{k^2}{\tan h k h} \quad \text{and} \quad \tan h k h = \frac{\lambda}{2} \]

(6)

\( \lambda \) denoting the wave-length \( 2\pi/k \). It appears, on calculating the component velocities from (6), that the motion of each particle is elliptic-harmonic, the semi-axes of the orbit, horizontal and vertical, being

\[ \beta \cos k(y + h) \quad \text{and} \quad \beta \sin k(x - ct) \]

where \( y \) refers to the mean level of the particle. The dimensions of the orbits diminish from the surface downwards. The direction of motion of a surface-particle is forwards when it coincides with a crest, and backwards when it coincides with a trough, of the waves.

When the wave-length is anything less than double the depth we have \( \tan h k h = 1 \), practically, and the formula (6) reduces to

\[ \psi = \frac{\psi}{\kappa} \cos k(y + h) \cos k(x - ct) \]

(7)

with

\[ \frac{1}{2} \int \frac{\psi}{\kappa} \cos k(y + h) \cos k(x - ct) \]

(8)

the same as if the depth were infinite. The orbits of the particles are now circles of radius \( \frac{\lambda}{2} \). When, on the other hand, \( \lambda \) is moderately large compared with \( h \), we have \( \tan h k h \approx \lambda/8 \), in agreement with the preceding theory of "long" waves. These results date from G. Green (1859) and Sir G. B. Airy (1845).

The energy of our simple-harmonic wave-train is, as usual, half kinetic and half potential, the total amount per unit area of the free surface being \( \frac{1}{2} \rho \omega^2 \). This is equal to the work which would be required to raise a stratum of fluid, of thickness equal to the surface-amplitude \( \beta \), through a height \( \beta \).

It has been assumed so far that the upper surface is free, the pressure there being uniform. We might also consider the case of waves on the common surface of two liquids of different densities. For wave-lengths which are less than double the depth of either liquid the formula (10) is replaced by

\[ c^2 = \frac{\rho - \rho'}{\rho + \rho'} \]

(11)

where \( \rho, \rho' \) are the densities of the lower and upper fluids respectively. Two cases of wave-motion \( \eta(x, y) \) has, by the nature of the formula, indicates a twofold cause: the potential energy of a given deformation of the common surface is diminished by the presence of the upper fluid in the ratio \( \rho'/\rho \), whilst the inertia is increased in the ratio \( \rho'/\rho \). When the two densities are very nearly equal the waves have little energy, and the oscillations of the common surface are very slow. This is easily observed in the case of paraflin oil over water.

To examine the progress, over the surface of deep water, of a disturbance whose initial character is given quite arbitrarily it would be necessary to resolve it by Fourier's theorem into systems of simple-harmonic trains. Since each of these is propagated with the velocity proper to its own wave-length, as given by (10), the resulting wave-profile will continually alter its shape. The case of an isolated local impulse has been studied in detail by S. D. Poisson (1816), A. Coubchla (1815) and others. At a stationary instant the surface is occupied on either side by a train of waves of varying height and length, the wave-length increasing, and the height diminishing, with increasing distance from the origin of the disturbance. The longer waves travel faster than the shorter, and that each wave is continually being drawn out in length, and its velocity of propagation therefore continually increases as it advances. If we fix our attention on a particular point of the surface, the level there will rise and fall with increasing rapidity and increasing amplitude. These statements are all involved in Poisson's approximate formula

\[ \eta = \frac{\rho}{\sqrt{2\pi}} \left( \cos \frac{\sqrt{2\pi}}{\psi} \sin \frac{\sqrt{2\pi}}{\psi} \right) \]

(12)

which, however, is only valid under the condition that \( x \) is large compared with \( \sqrt{\psi} \). It is shown here that the occurrence of a particular wave-length \( \lambda \) is conditioned by the relation

\[ x = \frac{1}{\sqrt{2\pi}} \sqrt{\lambda} \]

(13)

The foregoing description applies in the first instance only to the case of an initial impulse concentrated upon an infinitely narrow band of the surface. The corresponding results for the more practical case of a band of finite breadth are to be inferred by superposition. The initial stages of the disturbance at a large distance are, when compared with the breadth \( b \) of the band, will have the same character as before, but when, owing to the continual diminution of the length of the wave-lengths the waves of waves comparable with or smaller than \( b \), the parts of the disturbance which are due to the various parts of the band will no longer be approximately in the same phase, and we have a case of "interference" in the optical sense. The result is in general that in the final stages the surface will be marked by a series of groups of waves of diminishing amplitude separated by bands of comparatively smooth water.

The velocity at which the waves of the surface-train vary with the wave-length has an analogy in optics, in the propagation of light in a dispersive medium. In both cases we have a contrast with the simpler phenomena of waves on a string or of light on a succession of glasses. If we associate, as distinguished from wave-velocity, the new property, it is to be called the group-velocity, and it has been computed to be

\[ \frac{\delta \eta}{\delta x} = \frac{3C}{4} \frac{\delta}{\delta \omega} \]

(14)

since \( \lambda \) does not vary in the neighborhood of a geometrical point travelling with velocity \( U \), this being in fact the definition of \( U \). Again, if we imagine a second geometrical point to move with the water, we have

\[ \frac{\delta \eta}{\delta x} = \frac{3C}{4} \frac{\delta}{\delta \omega} \]

(15)

The member expressing the rate at which two consecutive wave-crescents are separating from one another. Comparing (14) and (15), we have

\[ U = c - \frac{3C}{4} \frac{\delta}{\delta \omega} \]

(16)

If a curve be constructed with \( \lambda \) as abscissa and \( \omega \) as ordinate, the group-velocity \( U \) will be represented by the intercept made by the tangent on the axis of \( \omega \). This is illustrated by the annexed figure, which refers to the case of deep-water waves; the curve is a parabola, and the intercept is half the diameter, in accordance with the relation \( U = c \), already remarked. The physical importance of the motion of group-velocity is pointed out by J. B. J. D. (1817), who showed that the rate at which energy is propagated is only half that which would be required for the transport of the group as a whole with the water.

The preceding investigations enable us to infer the effect of a pressure-disturbance travelling over the surface of still water, with say, a constant velocity \( c \) in the direction of \( x \)-negative. The abnormal pressure being supposed concentrated on an infinitely narrow band of the surface, the elevation \( \eta \) at any point \( P \) may be regarded as due to a succession of infinitely small impulses delivered over bands of the surface at equal infinitely short intervals of time on equidistant lines parallel to the (horizontal) axis of \( z \). Of the wave-systems thus successively generated, those only will be considered which have their origin in the neighbourhood of a line \( L \) whose position is determined by the consideration that the phase at \( P \) is "stationary" for variations in the position of \( Q \). Now if \( t \) be the time which the source of disturbance has taken to travel from the point \( P \) to the position \( Q \), it appears from (12) that the phase of the waves at \( Q \) originated at \( P \), is given by \( \sqrt{2\pi}t = c \), where \( \sqrt{2\pi}t = \omega \).

The condition that the stationary phase is therefore

\[ \sqrt{2\pi}t = c \]

(17)

In this differentiation, \( O \) and \( P \) are to be regarded as fixed; hence \( \sqrt{2\pi}t = c \), and therefore \( Q = c \times O \).

We have already seen that the wave-length at \( P \) is such that \( OQ = \omega \times OP \). From this conclusion, the whole group-velocity. Hence the
wave-length \( \lambda \) at points to the right of 0 is uniform, being that process a wave-velocity \( c \), viz. \( \lambda = 2\pi c / g \). The disturbance is therefore followed by a train of waves of approximately simple-harmonic profile, of the length indicated. An approximate calculation shows that, except in the immediate neighbourhood of the source of disturbance, the surface-elevation is given by

\[
\eta = \frac{2P_1}{\rho^2} \sin \frac{2\pi x}{\lambda},
\]

where \( x \) is now measured from 0, and \( P_1 = 4\rho d c \) represents the integral of the disturbing surface pressure over the (infinitely small) breadth of the band on which it acts. The case of a diffused surface pressure can be inferred by integration. The annexed figure gives a representation of a particular case, obtained by a more exact process. The pressure is here supposed uniformly distributed over a band of breadth \( AB \).

A similar argument can be applied to the case of finite depth (b), but since the wave-velocity cannot exceed \( \sqrt{2gh} \) the results are modified if the velocity \( c \) of the travelling pressure exceeds this limit. There is then no train of waves generated, the disturbance of level being purely local. It hardly needs stating that the investigation applies also to the case of a stationary surface disturbance on a running stream, and that similar results follow when the disturbance consists in an equality of the bottom. In both cases we have a train of standing waves on the down-stream side, of length corresponding to a wave-velocity equal to that of the stream.

The effect of a disturbance confined to the neighbourhood of a point on the surface of (deep water) was also included in the investigations of Cauchy and Poisson already referred to. The formula analogous to (12), in the case of a local impulse, is

\[
\xi = \frac{\rho}{2\pi} \sin \frac{2\pi r}{\lambda},
\]

where \( r \) denotes distance from the source. The interpretation is similar to that of the two-dimensional case, except that the amplitude of the annular waves diminishes outwards, as was to be expected, in a higher ratio.

The effect of a pressure-point travelling in a straight line over the surface of deep water is interesting, as helping us to account in some degree for the peculiar system of waves which is seen to accompany a ship. The configuration of the wave-system is shown by means of the lines of equal phase in the annexed diagram, due to V. W. Ekman (1906), which differs from the drawing originally given by Lord Kelvin (1887) in that it indicates the difference of phase between the transverse and diverging waves at the common boundary of the two series. The two systems of waves are due to the fact that at any given instant there are two previous positions of the moving pressure-point, which have transmitted vibrations of stationary phase to any given point \( P \) within the range of the figure. When the depth is finite, the configuration is modified, and if it be less than \( c/g \), where \( c \) is the velocity of the disturbance, the transversal waves disappear.

The investigations referred to have a bearing on the wave-resistance of ships. This is accounted for by the energy of the new wave-groups which are continually being started and left behind. Some experiments on torpedo boats moving in shallow water have indicated a falling off in resistance due to the appearance of transverse waves just referred to. For the effect of surface-tension and the theory of “ripples” see CAPILLARY ACTION.

§ 5. Surface-Waves of Finite Height.

The foregoing results are based on the assumption that the amplitude may be treated as infinitesimal. Various investigators have been made in which this restriction is, more or less, abandoned, but we are far from possessing a complete theory. A system of exact equations giving a possible type of wave-motion on deep water was obtained by F. J. v. Gerstner in 1802, and rediscovered by W. J. M. Rankine in 1863. The orbits of the particles, in this type, are accurately circular, being defined by the equations

\[
x = a + k \cdot \overline{a} \cdot \sin k(a - c), \quad y = b - k \cdot \overline{a} \cdot \cos k(a - c),
\]

where \((a, b)\) is the mean position of the particle, \( k = 2\pi / \lambda \), and the wave-velocity is

\[
c = \sqrt{k(g - a)} = \sqrt{2\pi / \lambda}.
\]

The lines of equal pressure, among which is included of course the surface-profile, are trochoidal curves. The extreme form of wave-profile is the cycloid, with the cusps turned upwards. The mathe-

**WAVELLE, a village of Tioga county, New York, U.S.A., about 18 m. S.E. of Elmira, on the Cayuta Creek, near the Chemung and the Susquehanna rivers, which unite several miles S. of the village. Pop. (1890) 4133; (1900) 4465, of whom 205 were foreign-born; (1905) 4915; (1910) 4855. It is served by the Delaware, Lackawanna & Western, the Erie and the Lehigh Valley railways. With South Waverly (pop. in 1910 1884)—separated from Waverly only by the state line and really a part of the village—Sayre, and Athens, Pennsylvania, it is connected by electric railway and the three form practically an industrial unit. Waverly is also connected by electric line with Elmira. The village is a railway centre of some importance, distributes coal from the Wyoming Valley mines, and ships the dairy products of a large farming district and small fruits and garden products. Waverly was settled about 1804 by settlers from Connecticut and the Hudson River Valley, and was incorporated as a village in 1854.

**WAVERLY, a town of Belgium, in the province of Brabant, 14 m. S.E. of Brussels. Pop. (1900) 857. It was on this place that Grouchy advanced on the day of Waterloo, gaining a useless success here over a Prussian corps while the fate of the campaign was being decided elsewhere. The Prussians erected here a fine monument by Van Oembron in 1859.

**WAX, a solid fatty substance of animal and vegetable origin, allied to the fixed oils and fats. From these it is distinguished by the fact that while oils and fats are glycerides, a true wax contains no glycerin, but is a combination of fatty acids with certain monomolecular alcohols (see Oils).**

**WAX FIGURES,** statues and statuettes of properties which render it a most convenient medium for preparing figures and models, either by modelling or by casting in moulds. At ordinary temperatures it can be cut and shaped with facility; it melts to a limpid fluid at a low heat; it mixes with any colouring matter, and takes surface tints well; and its texture and consistency may be modified by the addition of earthy matters and oils or fats. When molten, it takes the minutest impressions of a mould, and it sets and hardens at such a temperature that ordinary climatic influences affect the form it assumes, even when it cannot harden laminae. The facilities which wax offers for modelling have been taken advantage of from the remotest times. Figures in wax of their deities were used in the funeral rites of the ancient Egyptians, and deposited among other offerings in their graves; many of these are now preserved in museums. That the Egyptians also modelled fruits can be learned from numerous allusions in early literature. Among the Greeks during their best art period, wax figures were largely used as dolls for children; statuettes of deities were modelled for home shrines and for religious ceremonies, and wax images to which magical properties were attributed were treasured by the people. Wax figures and models held a still more important place among the ancient Romans. The masks (effigies or imaginis) of ancestors, modelled in wax, were preserved by patrician families, this *jus imaginum* being one of the privileges of the nobles, and these masks were exposed to view on ceremonial occasions, and carried in their funeral processions. The closing days of the Saturnalia were known as Sigillaria, on account of the custom of making, towards the end of the festival, presents of wax models of fruits and waxen statuettes which were fashioned by the *Sigillarii* or manufacturers of small figures in wax and other materials. The practice of wax modelling can be traced through the middle ages, when votive offerings of wax figures were made to churches, and the memory and lineaments of monarchs and great personages were preserved by means of wax masks as in the days of Roman patriarcars. In these ages malice and superstition found expression in the formation of wax images of hated persons, into the bodies of which long pins were thrust, in the confident expectation that thereby deadly injury would be induced to the person represented; and this belief and practice continued till the 17th century. Indeed the superstition still survives in the Highlands of Scotland, where recently a clay figure of an enemy was found in a stream, having been placed there in the belief that, as the clay was washed away, so would the health of the hated one decline. With the renaissance of art in Italy, modelling in wax took a position of high importance, and it was practised by some of the greatest of the early masters. The bronze medallions of Pisano and the other famous medallists owe their value to the art qualities of wax models from which they were cast by the *cire perdue* process; and indeed all early bronzes and metal work were cast from wax models. The *fili de cire* in the Wicar collection at Lille, the most lovely examples of artistic wax work is in this medium in existence. Wicar, one of Napoleon’s commissaries, brought this figure from Italy. It represents the head and shoulders of a young girl. It has been claimed as a work of Greek or Roman art, and has been assigned to Leonardo da Vinci and to Raphael, but all that can be said is that it probably dates from the Italian Renaissance. In 1909 Dr Bode, the director of the Kaiser Friedrich Museum at Berlin, purchased in England, for (it was stated) £8000, a life-sized half-length female figure in wax, which he attributed to Leonardo da Vinci or his school. The figure was shown to have once been in the possession of Richard Cocke Lucas (1800–1883), a sculptor and worker in ivory, wax, &c. It was claimed that the figure was really Lucas’s work and was a reproduction in wax of a picture of “Flora” attributed to Leonardo da Vinci, now in the possession of the Morrison family at Basildon Park, near Pangbourne; this view was repudiated by Dr Bode, but was generally accepted in England (see *The Times*, Oct.–Dec. 1909; and particularly the *Burlington Magazine*, May, June, August, 1910).

Till towards the close of the 18th century modelling of medallions of all kinds—by the latter frequently polyblot, was in considerable vogue throughout Europe. About the end of the 18th century Flaxman executed in wax many portraits and other relief figures which Josiah Wedgwood translated into pottery for his jasper ware. The modelling of the soft parts of dissections, &c., for teaching illustrations of anatomy was first practised at Florence, and is now very common. Such preparations formed part of a show at Hamburg in 1721, and from that time wax-works, on a plane lower than art, have been popular attractions. These exhibitions consist principally of images of historical or notorious personages, made up of wax masks on lay figures in which sometimes mechanism is fitted to give motion to the figure. Such an exhibition of wax-works with mechanical motions was shown in Germany early in the 18th century, and is described by Steele in the *Taller*. The most famous modern wax-work exhibition is that of Madame Tussaud (q.v.) in London.

**WAX-TREE, Wax Myrtle, Candleberry, popular names of species of *Myrica*, especially *M. cerifera*, a North American plant, the fruits of which have a waxy covering and are used as a source of vegetable wax. *M. Gale* is the native British gale (q.v.) or sweet-gale.

**WAXWING, a bird first so called apparently by P. J. Selby in 1825 (Illustr. Brit. Ornithology, p. 87), having been before known**
as the "silk-tail" (Philos. Trans., 1685, p. 116)—a literal rendering of the German Seideschwanz—or "chatterer"—the prefix "German," "Bohemian" or "waxed" being often also applied. Selby's convenient name has now been generally adopted, since the meristic system originated from almost all others by the curious expansion of the shaft of some of its wing-feathers at the tip into a flake that looks like scarlet sealing-wax, while its exceedingly silent habit makes the name "chatterer" wholly inappropriate, and indeed this last arose from a misinterpretation of the specific term garrulus, meaning a jaw (from the general resemblance in colour of the two birds), and not referring to any garrulous quality. It is the Ampelis garrulus of Linnaeus and of more recent ornithologists, and is the type of the Passerine family *Ampelidae.*

The third, and perhaps the most notable, is that for many years enjoyed vast interest. An irregular winter-visitant, sometimes in countless hordes, to the whole of the central and some parts of southern Europe, it was of old time looked upon as the harbinger of war, plague or death, and, while its harmonious coloration and the grace of its form were attractive, the curiosity with which its irregular appearances were regarded was enhanced by the mystery which enshrouded its birthplace, and until the summer of 1856 defied the searching of any explorer. In that year, however, all doubt was dispelled through the successful search in Lapland, organized by John E. V. S., as briefly described by him in the London Nat. (Proc. Zool. Soc., 1856, p. xxii). In 1856 H. E. D. Dresser found a small settlement of the species on an island in the Baltic near Uelåborg, and with his own hands took a nest. It is now pretty evident that the wax-bunting, though doubtless breeding yearly in some parts of northern Europe, is as irregular in the choice of its summer-quarters as in that of its winter-retreats. Moreover, the species exhibits the same irregular habits in America. It has been found in Nebraska in "millions," as well as breeding on the Yukon and on the Anderson river.

*Beckland* is the bird with its full erect crest, its cinnamon-brown plumage passing in parts into grey or chestnut, and relieved by black, white and yellow—all of the purest tint—the external feature which has invited most attention is the "silk-wax" (already mentioned) which tips some of the secondary or radial quills, and occasionally those of the tail. This is nearly as much exhibited by the kindred species, *A. cedrorum*—the well-known cedar-bird of the English in North America—which is easily distinguished by its smaller size, black chin-spot, the yellower tinge of the lower parts and the want of white on the wings. In the *A. phoeniceus* of southern-eastern Siberia and Japan, the reddest of the species, the "silk-wax" is worn in the ordinary way without dilatation of the shaft of the feathers.

Both the waxwing and cedar-bird seem to live chiefly on insects in summer, and on berries and fruits in winter, and they are very abundant during the latter part of the year, and will gorge themselves if opportunity allow. They are pleasant cage-birds, quickly becoming tame. The erratic habits of the waxwing are probably due chiefly to the supplies of food it may require, prompted also by the number of mouths to be fed, for there is some reason to think that this varies greatly from one year to another, according to season. The flocks which visit Britain and other countries outside the breeding range of the species naturally contain a very large proportion of young birds.

**WAYCROSS—WAYLAND THE SMITH**

WAYLAND, FRANCIS (1796-1865), American educationalist, was born in New York City on the 13th of March 1796. His father was an Englishman of the same name, who was a Baptist pastor. The son graduated at Union College in 1813 and studied medicine in Troy and in New York City, but in the latter year entered Andover Theological Seminary, where he was greatly influenced by Moses Stuart. He was too poor to conclude his course in theology, and in 1817-1821 was a tutor at Union College, to which after five years as pastor of the First Baptist Church of Boston he returned in 1826 as professor of natural philosophy. In 1827 he became president of Brown University. In the twenty-eight years of his administration he gradually built up the college, improving academic discipline, formed a library and gave scientific studies a more prominent place. He also wrote several higher classical and scientific works, and composed text-books on ethics and economics, and promoting the free-school system of Rhode Island and especially (1828) of Providence.

His *Thoughts on the Present Collegiate System in the United States* (1842) and his *Report to the Corporation of Brown University* of 1850 pointed the way to educational reforms, particularly the introduction of industrial courses, which were only partially adopted in his lifetime. He resigned the presidency of Brown in 1855, and in 1857-1858 was pastor of the First Baptist Church of Providence. He died on the 30th of September 1865. He was an early advocate of the temperance and anti-slavery movements, for which he was "inspector of the state prison and Providence county jail," president of the Prison Discipline Society, and active in prison reform and local charities. He was one of the "law and order" leaders during the "Dorr Rebellion" of 1842, and was called "the first citizen of Rhode Island."

His son Francis (1826-1904) graduated at Brown in 1846, and studied law at Harvard; he became probate judge in Connecticut in 1864, was lieutenant-governor in 1869-1870, and in 1872 became a professor in the Yale Law School, of which he was dean from 1873 to 1903.

There are several volumes of his letters and addresses and the volumes already mentioned, he published *Elements of Moral Science* (1835, repeatedly revised and translated into foreign languages); *Elements of Political Economy* (1837), in which he advocated free-trade; *The Limitations of Human Responsibility* (1838); *Domestic Slavery Considered as a Scriptural Institution* (1845); *Memoirs of Harriet Ware* (1850); *Memoirs of Adoniram Judson* (1853); *Elements of Intellectual Philosophy* (1854), *Notes on the Principles and Practices of Baptist Churches* (1857); *Letters on the Ministry of the Gospel* (1863); and a *brief Memoir of Thomas Chalmers* (1864).

See *The Life and Labors of Francis Wayland* (2 vols., New York, 1870), by his sons Francis and Henry; *Wayland's Life and Labor* (Boston, 1891) by James O. Murray in the *American Religious Leaders* series; and an article by G. C. Verplanck in vol. xiv. of the American Journal of Education.

**WAYLAND THE SMITH** (Scand. *Völundr, Ger. Wieland*), hero of romance. The legend of Wayland probably had its home in the north, where he and his brother Egill were the types of the skilled workman, but there are abundant local traditions of the wonderful smith in Westphalia and in southern England. His story is told in one of the oldest songs of the Edda, the *Völundarkvida*, and, with considerable variations, in the prose *Píberkessaga* (Thidrök's saga), while the Anglo-Saxon *Beowulf* and *Dor's Lament* contain allusions to it. The tale of Wayland falls naturally into two parts, the former of which contains obviously mythical features. He was the son of the giant sailor Wate and of a mermaid. His grandfather was that Víkinus, king of Norway, who lent his name to the *Víkin- or Píberkessaga.* Three brothers Völundr, Egill and Sigláfir seized the swan-maidens Hálgubý, Olfrún and Hervör, who, divested of their feather dresses, stayed with them seven or eight years as their wives. The second part of the story concerns Völundr, lord of the elves, the cunning smith, who, after learning his art from Mime, then from the dwarfs, came to the court of King Njörpr, and there defeated in fight the smith Amilias. Völundr's sword, Mingum, with which he won this victory, was one of the famous weapons in German epic poetry. In the Dietrich cycle it descended to Egill was compelled to prove his skill as an archer by shooting an apple off the head of his three-year-old son; he is thus the prototype of William Tell.
Wayne's son Wittich, and was cunningly exchanged by Hildebrand for a commoner blade before Wittich's fight with Dietrich, NiPoFr, in order to secure Völundr's services, lamed him by cutting the sinews of his knees, and then established him in a smithy on a neighbouring island. The smith avenged himself by the slaughter of NiPoFr's two sons and the rape of his daughter Bodvildr. He then soared away on wings he had prepared. The story in its main outlines bears a striking resemblance to the myth of Daedalus. For the vengeance of Völundr there is a very close counterpart in the medieval versions of the vengeance of the Moorish slave on his master. The dénouement of this tale, which made its first appearance in European literature in the De obedientia (Opera, Venice, 3 vols., 1516-1518) of Joannis Fontanus (d. 1503), is different, for the Moorish slave casts himself down from a high tower. The Aaron of the Shakespearian play of Titus Andronicus was eventually derived from this source.

Swords fashioned by Wayland are regular properties of medieval romance. King Rhyderich gave one to Merlin, and Rimenhild made a similar gift to Child Horn. English local tradition placed Wayland Smith's forge in a cave close to the White Horse in Berkshire. If a horse to be shod, or any broken tool was left with a sixpenny piece at the entrance of the cave the repairs would presently be executed.

The earliest extant record of the Wayland legend is the representation in carved ivory on a casket of Northumbrian workmanship of a date not later than the beginning of the 8th century. The fragments of this casket, known as the Franks casket, came into the possession of a professor at Clermont in Auvergne about the middle of the last century, and was presented to the British Museum by Sir A. W. Franks, who had bought it in Paris for a dealer. One fragment is in Florence. The left-hand compartment of the front of the casket shows Völundr holding with a pair of tongs the skull of one of NiPoFr's children, which he is fashioning into a golebit. The boy's body lies at his feet. Bodvildr and her attendant also appear, and Egill, who in one version made Völundr's wings, is depicted in the act of catching birds.

WAYNE, ANTHONY (1745-1796). American soldier, was born in the township of Easttown, Chester county, Pennsylvania, on the 1st of January 1745, of a Yorkshire family. As a boy he exhibited a marked bent toward a military life. He was educated in Philadelphia, and was a surveyor in Pennsylvania and (1765) in Nova Scotia, where he was agent for a proposed colony. He married in 1766 and passed the next few years on the Chester county farm inherited from his father, holding some minor offices and after 1774 taking an active part upon various patriotic committees. Having recruited and organized the Fourth Pennsylvania battalion of Continental troops, he first saw active service at its head in Canada during the retreat of Benedict Arnold after the Quebec campaign. His excellent behaviour at the skirmish of Three Rivers led Philip Schuyler to place him for some months in command of Ticonderoga. While at this post, on the 21st of February 1777, he was commissioned brigadier-general. In April Washington ordered him to take command of the Pennsylvania Line at Morristown, and he rendered distinguished service at Brandywine and Germantown, and by his coolness and courage at Monmouth after the retreat of General Charles Lee, did much to save the day for the Americans. Later in 1778 political necessity led to his being superseded by St Clair, his ranking officer, in the command of the regular Pennsylvania troops, but upon Washington's recommendation he organized a new Light Infantry corps, with which he performed the most daring exploit of the War of Independence—the recapture of Stony Point by a midnight attack (15-16 July 1779) at the point of the bayonet. This well-planned enterprise averted the greatest disaster to the country and won for Wayne the popular sobriquet "Mad Anthony." Upon the disbanding of the Light Infantry corps, Wayne, again in command of the Pennsylvania line, rendered effective service in countering the effect of Benedict Arnold's treason and of the mutiny of the Pennsylvania troops. In 1781 he was sent south to join General Nathanael Greene, but in Virginia was deflected to aid Lafayette against Lord Cornwallis. After the American success at Yorktown, Wayne served with such marked success in Georgia, that the state rewarded him with a large rice plantation (which proved a financial failure) and Congress brevetted him major-general. In 1792 Washington offered him the command of the regular army with the rank of major-general to fight the hostile Indians north-west of the Ohio, who had been rendered insolent by their successes over General Josiah Harmar in 1790 and General Arthur St Clair in 1791, and indirectly to compel the British to yield the posts they held on the American side of the lakes. Wayne spent the winter of 1792-1793 in recruiting his troops near Pittsburg and in drilling them for effective service in the reorganized army. The government continued his efforts to induce the Indians to allow white settlements beyond the Ohio, but a mission in 1793 ended in a failure. Meanwhile Wayne had transferred his troops to Fort Washington (Cincinnati), and upon learning of the failure of the negotiations, advanced the greater part of his forces to Greenville, a post on a branch of the Great Miami, about 80 m. north of Cincinnati. During the winter he also established an outpost at the scene of St Clair's defeat. The Indians attacked this post, Fort Recovery, in June 1794, but were repulsed with considerable slaughter. Late in July Wayne's legion of regulars, numbering about 12,000, was reinforced by about 1,600 Kentucky militia under General Charles Scott, and the combined forces advanced to the junction of the Auglaize and Maumee rivers, where Fort Defiance was constructed. Here Wayne made a final effort to treat with the Indians, and upon being rebuffed, moved forward and encountered them on the 20th of August in the battle of Fallen Timbers, fought near the falls of the Maumee, and almost under the walls of the British post Fort Miami. This decisive defeat, supplemented by the Treaty of Greenville, which he negotiated with the Indians on the 3rd of August 1795, restored possession of the Northwest to civilization. Wayne retained his position as commander of the army after its reorganization, and he rendered service in quelling the proposed filibustering expeditions from Kentucky against the Spanish dominions, and also took the lead in occupying the lake posts delivered up by the British. While engaged in this service he died at Erie, Pennsylvania, on the 14th of December 1796, and was interred there. In 1809 his remains were removed to St David's Churchyard, Radnor, Pennsylvania.
WAYNFLETE.—WAYNFLETE.

433

WAYNFLETE, William (1395-1486), English lord chancellor and founder of Waynflete College at Oxford, was the son of Richard Pattene or Patyn, alias Barbour, of Wainfleet, Lincolnshire (Magd. Coll. Oxon. Reg. f. 84b), whose monumental effigy, formerly in the church of Wainfleet, now in Magdalen College Chapel at Oxford, seems to be in the dress of a merchant. His mother was Margery, daughter of Sir William Breerton of that ilk in Cheshire (Ormerod's Cheshire, iii. 81). Of Waynflete's education it is only possible to assert that he was at Oxford University. It has been alleged that he was a Wykehamist, a scholar at Winchester College and New College, Oxford. But unless he was, as is improbable, the Willelmus Pattene, de sceam, Sar. Dio. (admitted in 1433), he was certainly not a scholar of New College. Nor was he a commoner in college at Winchester or at New College, as his name does not appear in any book of matriculation, hall books, or lists of those dining in hall, at either college. That he was a day-boy commoner at Winchester is possible, but seems unlikely. He was never named in college as one of its alumni. That he was at Oxford, and probably a scholar at one of the grammar schools there, before passing on to the higher faculties, is shown by a letter of the chancellor addressed to him when provost of Eton (Ep. Act. Hist. Soc. 158) which speaks of the university authority as his "mother who brought him forth into the light of knowledge and nourished him with the alimony of all the sciences."

It is probably William Barbour who was ordained acolyte by Bishop Fleming of Lincoln on the 21st of April 1420 and sub-deacon on the 21st of January 1421; and as "William Barbour", otherwise Waynfete of Spalding, was ordained deacon on the 18th of March 1421, and priest on the 21st of January 1426, with title from Spalding Priory. He may have been the William Waynlete who was admitted a scholar of the King's Hall, Cambridge, on the 6th of March 1428 (Exch. Q. R. Bolding, 346, 10, 31), and was described as "LL.B." after several years of residence here and protection on the 15th of July 1420 (Proc. P.C. iii. 347) to enable him to accompany Robert FitzHugh, D.D., warden of the hall, on an embassy to Rome. For the scholars of the King's Hall were what we should call fellows, as may be seen by the appointment to the hall on the 3rd of April 1360 of Nicholas of Drayton, B.C.L. and John Kent, B.A., instead of two scholars who had gone off to the French wars without the warden's leave (Cal. Close Rolls).

William Waynlete, presented to the vicarage of Skidby, Lines, by the Priory of Bardney (Lincoln, Ep. Reg. f. 34, Chandler, 16), on the 14th of June 1430, may also have been ourWaynlete. There was, however, another William Waynlete, who was instituted rector of Wroxhall, Somerset, on the 15th of May 1433 (Wells, Ep. Reg. Stafford), and was dead when his successor was appointed on the 18th of November 1436 (Wells, Ep. Reg. Stillington). A successor to the William Waynlete at the King's Hall was admitted on the 3rd of April 1434.

Meanwhile, our Waynlete had become headmaster of Winchester; Mr William Wannellote being paid 50s. as informator scolarium, teacher of the scholars of the college, for the quarter beginning on the 24th of June 1430 (Win. Coll. Bursars' Roll 8-Hen. VI.) and so continuously, under many variants of spelling, at the rate of £10 a year until Michaelmas 1441 (V.C.H., Bucks, ii. 154). He was collated by Bishop Beaufort at some date unascertainable (through the loss of the 2nd volume of Beaufort's Episcopal Register) to the mastership of St Mary Magdalen's Hospital, a leper hospital on St Giles' Hill, just outside the city of Winchester (Vet. Mon. iii. 5). The first recorded headmaster after the foundation of the college, John Melton, had been presented by Wykeham to the mastership of this hospital in 1393 shortly before the death of Anthony Wyneborow; and his retirement and turbulent successor, named William, was succeeded on the 20th of August 1434, aged 29, 12s. a year, nearly doubling the headmaster's income.

Under the influence of Archbishop Chicheley, who had himself founded two colleges in imitation of Wykeham, and Thomas Bekynton, king's secretary and privy seal, and other Wykehamists, Henry VI., on the 11th of October 1440, founded, in imitation of Winchester College, "a college in the parish church of Eton by Windsor not far from our birthplace," called the King's College of the Blessed Mary of Eton by Windsor, as "a sort of first-fruits of his taking the government on himself." The college was to consist of a hundred fellows, and was endowed with a sum of £25 poor and needy scholars, 25 almsmen and a magister informator "to teach gratis the scholars and all others coming from any part of England to learn grammar." Only two fellows, 4 choristers, 2 scholars and 2 almsmen were named in the charter and probably were only colourably members. Waynflete was not, as alleged (Dict. Nat. Biog.), named a fellow. On the 5th of March 1440-1441, the king endowed the college out of alien priories with some £500 a year, almost exactly the amount of the original endowment of Winchester. On the 31st of July 1441 Henry VI. went for a week-end visit to Winchester College; and he is said to have been much impressed with Waynflete, that at Michaelmas, 1441, Waynflete ceased to be headmaster of Winchester. In October he appears dining in the hall there as a guest, and at Christmas 1442 he received a royal livery, five yards of violet cloth, as provost of Eton. Though reckoned first headmaster of Eton, there is no definite evidence that he was. The school building was not begun till May 1442 (V.C.H., Bucks, ii. 154). William Westbury, who left New College, "transferring himself to the king's service," in May 1442, and appears in the first extant Eton Audit Roll 1442-1445, was probably the first headmaster. If Waynflete was headmaster from October 1441 to May 1442, his duties must have been little more than nominal. As provost, Waynflete procured the exemption of the college from archidiaconal authority on the 2nd of May, and made the contract for completion of the carpenter's work of the eastern side of the quadrangle on the 30th of November 1443. On the 21st of December 1443 he was sworn to the statutes by Bishop Bekynton and the earl of Suffolke, the king's commissioners, and himself administered the oath to the other members of the foundation, then only five fellows and eleven scholars over fifteen years of age. He is credited with having taken half the scholars and fellows of Winchester to Eton to start the school there. In fact, five scholars and perhaps one commoner left Winchester for Eton in 1443, probably in July, just before the election. For three of them were admitted scholars of King's College, Cambridge, on the 10th of July, that college, by its second charter of the 10th of July 1443 having been placed in the same relation to Eton that New College bore to Winchester; i.e. it was to be recruited entirely from Eton. The chief part of Waynflete's duties as provost was the financing and completion of the buildings and college establishment. The number of scholars was largely increased by an election of 25 new ones on the 26th of September 1444, the income being then £946, of which the king contributed £120 and Waynflete £18, or more than half his stipend of £50 a year. The full number of 70 scholars was not filled up till Waynflete's last year as provost, 1446-1447 (Eton Audit Roll). So greatly did Waynflete ingratitude himself
with Henry that when Beaufort, bishop of Winchester, Henry's uncle, died on the 11th of April 1447, the same day Henry wrote to the chapter of Winchester, the prior and monks of St. Withnian's cathedral, to elect Waynflete as his successor. On the 12th of April he was given the custody of the temporalties, on the 15th of April he received hissed to the prosperity and the May went to some see a papal bull. On the 13th of July 1447 he was consecrated in Eton church, when the warden and fellows and others of his old college gave him a horse at a cost of £6, 13s. 4d., and 13s. 4d. to the boys. Subsequent visits to Winchester inspired Henry with the idea of rebuilding Eton church on cathedral dimensions. Waynflete was assigned as the principal executor of his "will" for that purpose, and if there was any variance between the executors, he was to determine it. From 1448 to 1459 £3336 or some £100,000 of our money was spent on the church, of which Waynflete was the marquis of Suffolk and the bishop of Salisbury contributed £500 or £11,000. The troubles which began in 1459 put a stop to the work.

Waynflete, as bishop, lost no time in following the example of Wykeham and his royal patron in becoming a college founder. On the 6th of May 1448 he obtained licence in mortmain and on the 20th of August founded at Oxford "for the extirpation of heresies and errors, the increase of the clerical order and the adornment of holy mother church, a perpetual hall, called Saint Marie Maudeleyen Halle, for study in the sciences of sacred theology and philosophy," to consist of a president and 50 scholars. Without being able to fill the present college, but of two earlier halls called Boston and Hare, where the new schools now are. Thirteen M.A.'s and seven bachelors, besides the president, John Hornley, B.D., were named in the charter. The dedication to Mary Magdalen was no doubt derived from the hospital at Winchester of which the founder had been master. On St. Wolstan's Day, the 19th of January 1448-1449, Waynflete was enthroned in Winchester cathedral in the presence of the king; and, probably partly for his sake, parliament was held there in June and July 1449, when the king frequently attended the college chapel, Waynflete officiating (Win. Coll. Reg. Vet.). When Jack Cade's rebellion occurred in 1450 Waynflete was employed with Archbishop Stafford, the chancellor, to negotiate with the rebels at St. Margaret's church, Southwark, close to Winchester House. A full pardon was promised, but on the 1st of August Waynflete was one of the special commissioners to try the rebels. On the 7th of May 1451 Waynflete, from "le peynted chambre "in his manor house at Southwark, asserting that his bishopric was canonically obtained and that he laboured under no disqualification, but feared some grievous attempt against his life, entered London. "It is suggested (Dict. Nat. Biol.) that this was due to some disturbances at Winchester (Proc. P.C. vi. 108), where one of Cade's quarters was sent after his execution. But it is more likely, as suggested by Richard Chandler (Life of Waynflete, 1811), that it was some Yorkist attack on him in progress in the papal court, to meet which he appointed next day 100 portors to act for him. In the result nothing disturbed his peaceable possession of the see. With the archbishop of Canterbury he received Henry VI. on a pilgrimage to St. Thomas à Becket on the 29th of August. When he was in London the Yorkists were encamped near Dartford, Waynflete with three others was sent from the king's camp at Blackheath to propose terms, which were accepted. Edward, prince of Wales, was born on the 13th of October 1453 and baptized by Waynflete the next day. This year Waynflete acquired the reversion of the manor of Stanswick, Berks, from Lady Danvers (Chandler, p. 87) for Magdalen Hall. The king became insane in 1454. On the death of the chancellor, John Kemp, archbishop of Canterbury, during the sitting of parliament, presided over by the duke of York, commissioners, headed by Waynflete, were sent to Henry, to ask him to name a new chancellor, apparently intending that Waynflete should be named. But no answer could be extracted from the king, and after some delay Lord Salisbury took the seals. During York's regency, both before and after the battle of St. Albans, Waynflete took an active part in the proceedings of the privy council. With a view to a ampler site for his college, Waynflete obtained on the 5th of July 1456 a grant of the Hospital of St John the Baptist outside the east gate at Oxford and on the 15th of July licence to found a college there. Having obtained a papal bull, he founded it by deed of the 14th of June 1458, when the college the same as the waynflete his self and its possessions, its members being incorporated into "the New College of St Mary Magdalen."

Meanwhile Waynflete himself had been advanced to the highest office in the state, the chancellorship, the seals being delivered to him by the king in the priory of Coventry in the presence of the duke of York, apparently as a person acceptable to both parties. On the 27th of October 1457 he took part in the trial and condemnation for heresy of Reginald Pecock, bishop of Chichester, who had been ordained subdeacon and deacon on the same day and by the same bishop as Waynflete himself. Only Pecock's books and not the heretic were burnt. As the heresy consisted chiefly in defending the clergy on grounds of reason instead of authority, the proceeding does not show any great enlightenment on Waynflete's part. It must have been at this time that an addition was made by Waynflete to the Eton college statutes, compelling the fellows to forebear the heresies of John Wycliffe and Pecock. Waynflete presided as chancellor at the parliament at Coventry in November 1459, which, after the Yorkist catastrophe at Ludlow, attainted the Yorkist leaders. It was no doubt because of this that, three days before the Yorkist attack at Northampton, he delivered the great seal to the king in his tent near Delapre abbey, a nursery by Northampton, on the 7th of July 1460 (Rot. Clau. 38 Hen. VI. m. 5 d.). It was taken with Henry and handed to the Yorkist, George Neville, bishop of Exeter, brother of the kingmaker, earl of Warwick, in London on 25th July following. Whether, as alleged by some, Waynflete fled and hid himself during the period covered by the battle of Wakefield and Edward's first parliament in 1461, is very doubtful. A testimonial to his fidelity written by Henry to the pope on the 8th of November 1460 (Chandler, p. 147, written while Henry was in Yorkist hands. The fact too that complaints laid before Edward IV. himself in August 1461 of wrongful exaction of manorial rights from the tenants of the episcopal manor of East Meon, Hants, were decided in the bishop's favour in parliament in the December following (Rot. Parl. v. 475) also suggests that he was not regarded as an enemy to the Yorkists, though a personal favourite of Henry's. A general charter of confirmation to him and his successors of the property and rights of the bishopric of Winchester on the 1st of July 1462 (Pat. 4 Ed. IV. pt. ii. m. 16) does not appear. On the restoration of Henry VI. in 1464-5, Waynflete, after the restoration of his position, was welcomed at the Tower, which necessitated a new pardon, granted a month after Edward's reinstatement on the 30th of May 1471 (Pat. 11. Ed. IV. pat. i. m. 24), and a loan to the king of 2000 marks (£1333, 6s. 8d.), or some £4,000 of our money. In the years 1471-1472 to 1474 Waynflete was largely engaged in completing the church, now called chapel, at Eton, his glazier supplying the windows, and he contracted on the 15th of August 1475 for the roof-loft to be made on one side "like to the rode loft in Bishop Wykeham's college at Winchester," and on the other like that "of the college of St Thomas of Acres in London."

In 1470 he built the ante-chapel at the west-end, as it now stands, of stone from Headington, Oxford.

In 1474 Waynflete, being the principal executor of Sir John Fastolf, who died in 1459, leaving a much-contested will, procured the conversion of his bequest for a collegiate church of
seven priests and seven almsmen at Caistor, Norfolk, into one for seven fellows and seven poor scholars at Magdalen. In the same year that college took possession of the alien priory of Sele, Sussex, the proceedings for the suppression of which had been going on since 1460. The new, now the old, buildings at Magdalen were begun the same year, the foundation-stone being laid in the middle of the high altar on the 5th of May 1474 (Wood, 297). Licences on the 1st of July, the 2nd of July 1477 and the 12th of July 1480 authorized additions to the endowment. On the 23rd of August 1480, the college being completed, the great west window was contracted to be made after the fashion of that at All Souls' College, a new president, Richard Mayhew, fellow of New College, was installed on the 23rd of August 1480, and statutes were promulgated. The foundation is commonly dated from this year and not from 1448, when Magdalen Hall was founded, though if not dated from 1448 it surely dates from 1458, when that hall and St John's Hospital were converted into Magdalen College. The statutes were for the most part a repetition of those of New College, member of the same corporation, but, equally with members of Magdalen, declared to be eligible for the presidency. They provided for a head and 70 scholars, but the latter were divided into 40 fellows and 30 scholars called demesies, because their commons were half those of the fellows. Magdalen College School was established at the gates and as a part of the college, to be, like Eton, a free grammar school, free of tuition fees for all comers, under a master and usher, the first master being John Ankywylly, a married man, with a salary of £10 a year, the same as at Winchester and Eton. The renewal of interest in classical literature is shown in the statutes for the Grammar School, which are by any scholar under the age of eighteen, unless he had been pronounced proficient in grammatics. On the 22nd of September 1481 Waynflete received Edward IV. in state at the college, where he passed the night, and in July 1483 he received Richard III. there in even greater state, when Master William Grocyn, "the Grecian," a fellow of New College, "responded," in divinity. In 1484 Waynflete gave the college the endowment for a free grammar school at his name-place, Wainfleet, sufficient to produce for the chantry-priest-schoolmaster £40 a year, the same salary as the headmaster of Magdalen College, and built the school which still exists almost unaltered, a fine brick building with two towers, 76 ft. long by 26 ft. broad. The next year saw the appropriation to the college of the Augustinian Priory of Selborne, Hants.

On the 27th of April 1486, Waynflete, like Wykeham, made his will at their favourite manor, South or Bishop's Waltham. It is remarkable that he gives the same pecuniary bequests to Winchester and New Colleges as to his own college of Magdalen, but the latter he made residuary devisee of all his lands. He died on the 11th of May 1486, and was buried in the chantry of Waynflete's newly founded college behind the high altar in Winchester cathedral, which he had erected in his lifetime. The effigy on it may be taken to be an authentic portrait. (A. F. L.)

WAYZGOOSE, a term for the annual dinner and outing of printers and their employees. The derivation of the term is doubtful. It may be a misspelling for "wasegoose," from was, Mid. Eng. for "sheaf," thus meaning sheaf or harvest goose, the bird that was fit to eat at harvest-time, the "stubble-goose" mentioned by Chaucer in "The Cook's Prologue." It is more probable that the merry-making which has become particularly associated with the printers' trade went on during the annual feast and an imitation of the grand goose-feast annually held at Waes, in Brabant, at Martinmas. The relations of England and Holland were formerly very close, and it is not difficult to believe that any outing or yearly banquet might have grown to be called colloquially a "Waes-Goose." It is difficult to explain why the term should have only survived in the printing trade, though the English printers owed much to their Dutch fellow-workers. Certainly the goose has long ago parted company with the printers' wayzgoose, which is usually held in July, though it has not fixed season. An unlikely suggestion is that the original wayzgoose was a feast given by an apprentice to his comrades at which the bird formed the staple catable.

WAYZGOOSE—WAZIRISTAN

WAZIR, or Vizier (Arabic vezir), a minister, usually the principal minister under a Mahommedan ruler. In India the nawab of Oudh was long known as the nawab wazir, the title of minister to the Mogul emperor having become hereditary in the family.

WAZIRABAD, a town of British India, in Gujranwala district of the Punjab, near the right bank of the river Gomal, 6 m. S.S.W. of Lahore. Pop. (1891) 18,066. It is an important railway junction. The main line of the North-Western railway here crosses the Chenab by the Alexandra bridge, opened by the prince of Wales in 1876. The branch to Sialkot has been extended to Jammu (51 m.); another branch follows the line of the Chenab canal toward Multan. Boat-building and manufactures of steel and iron are carried on.

WAZIRISTAN, a section of the mountain tract in the North-West Frontier Province of India, lying between the Tochi river on the north and the Gomal river on the south. The whole of Waziristan lies within the British sphere of influence, the boundary with Afghanistan having been demarcated in 1894. It forms two political agencies, but only a portion, consisting of the Tochi valley, with an area of about 700 sq. m. and a population (1909) of 24,670, is directly administered. Northern Waziristan has an area of about 2310 sq. m., and southern Waziristan an area of about 2734 sq. m.

The Tochi and the Gomal rivers enclose Waziristan, their affluents rising to the west of that country in the upland valleys of Shawai and Birmal, and flowing north and south to a junction with the main stream. In the annexation territory of the latter is the great basin drainage of Waziristan from north-east to south-west, geologically connected with the great limestone ranges of the Suliman hills to the south, and dominated by the great peaks of Shuidar (Sheikh Haidar) and Pirghal, both of them between 11,000 and 12,000 ft. above the sea, and hardly inferior to the Khaisargaorge peak of the Takhti-Suliman. From these peaks westwards a view is obtained across the grass slopes and cedar woods of Birmal and Shawai (lying thousands of feet below) to the long, serrated ridges of the central watershed which shuts off the plains of Guzani. To the eastward several lines of high mountains, the broad folds and flexures of the mountains, of which the conformation is here distinctly observable, although not so marked as it is south of the Gomal. These lines of drainage are, as usual, the main avenues of approach to the interior of the country. They are the Khaisora and the Shuddu on the north, which, uniting, join the Tochi south of Bannu, and the Tank Zam (which is also called Khaisor near its head) on the south. The two former lead from the frontier to Rasmak and Makin, villages of some local importance, situated on the slopes of Shuidar; and the latter leads to Kaniguram, the Waziri capital, and the centre of a considerable iron trade. Kaniguram lies at the foot of the Pirghal mountain.

Amongst the mountains of Waziristan there is much fine scenery and a delightful climate. Thick forests of ilex clothe many of the spurs, which reach down to the grassy deodar-covered uplands of Birmal on the west; and the spreading poplar attains magnificent dimensions amongst the flats and plateaus of the eastern slopes. The indigenous trade of the country is considerable, although Waziri iron is much esteemed. The agricultural products are poor, and the general appearance of the people is hidden by a mixture of hardship and extreme desertion. The most notable product of the country is the Waziri breed of horses and donkeys. The latter especially deserve to rank as the best of their kind on the Indian frontier, if not in all India.

The geological formation of Waziristan is the same as that of the contiguous frontier. Recent subaqueous deposits have been found in a central upthrow of limestone; the lower hills are soft in composition and easily weathered, the slopes are rounded, and large masses of detritus have collected in the nullah beds and raised their level. Through these deep rivers have forced their way with many bends and curves to the plains, enclosing within each curve a "wam," or "rughz," which slopes gradually to the hills and affords the only available space for irrigation and agriculture. A "wam" is a gently sloping open space, generally
WAZZAN—WEALD, THE

raised but slightly above the river level. A "rāghzā" differs from a "wān" in being on a higher level and often beyond the reach of irreg., the most settled found along the two hills, but with only the borders of the main streams. Passing up and down these main water-courses, there is an appearance of great fertility and wealth, which is entirely due to these thriving strips of verdure, their restricted and narrow limits being hardly visible from the river beds. From above, when viewed from the flanking ridges, the vast extent of hill country, neither high, nor imposing, nor difficult of access, is seen as a green and rounded mass, comprising two bands of enclosed cultivation winding about like green ribbons, and marking the course of the main streams from the snow-covered peaks to the plains. The physiography of Waziristan is that of the Kurram to the north rather than that of the Suliman hills to the south.

The Waziris are the largest tribe on the frontier, but their state of civilization is very low. They are a race of robbers and murderers, and the Waziri name is execrated even by the neighbouring Mahomedan tribes. Mahomedans from a settled district often regard Waziris as untouchables, and seem inclined to deny their title to belong to the faith. They have been described as being "free-born and murderous, hot-headed and light-hearted, self-respecting but vain." The poverty of their country and the effort required to gain a subsistence in it have made the Waziris a hardy and enduring race. Their physique is uncommonly good, and though on the average short of stature, some extremely tall and large men are to be found amongst them. They are generally deep-chested and compact of build, with a powerful muscular development common to the whole Turkish race, confident, and capable of enduring long and arduous marches.

They enjoy a good knowledge of arms, and are often trained by the British, who have become the most civilizing power amongst them. The Waziris incline towards a war-like disposition, and with their hill tribes of the Himalayas as mountaineers the Waziris would probably hold their own with any other Pathan tribe of the frontier.

Except in a few of the highest hills, which are well-wooded, the Waziri country is a mass of rock and stones, bearing a poor growth of grass and thinly sprinkled with dark evergreen bushes; progress in every direction except on devious paths known to the natives is obstructed by precipices or by toilsome stony ascents; and knowledge of the topography, a mere labyrinth of intricate ranges and valleys, comes only as the result of long acquaintance. Broken ground and tortuous ravines, by making crime easy and precaution against attack difficult, have fostered violence among the people and developed in them an extraordinary faculty of prudence and alertness. In consequence of his isolation the Waziri has become independent, self-reliant and democratic in sentiment. Through the inaccessibility of his own country to lowerlanders, combined with the proximity of open and fertile tracts inhabited by races of inferior stamina, he has developed into a confirmed raider; and the passage through his country of mountain footpaths, common to Afghan, Afghan Pathan and Turkic tribes, offers the opportunity a hereditary highwayman as well. The women enjoy more freedom than amongst most Pathan tribes, and are frequently unfaithful. The ordinary punishment of adultery is to put the woman to death, and to cut off half the right foot of the man. Amongst Waziris also, as amongst other Pathans, the blood-feud is a national institution.

The Waziris, who number some 40,000 fighting men altogether, are divided into two main sections, the Darwesh Khel (50,000) and the Mahsuds (50,000), with two smaller sections. The Darwesh Khel, the more settled and civilized of the two, inhabit the lower hills bordering on Kohat and Bannu districts, and the ground lying on both sides of the Kurram river, between Thal on the north and the Tochi Valley on the south. The Mahsuds, who inhabit the tract of country lying between the Tochi Valley on the north and the Gomal river on the south, have earned for themselves an evil name as the most confirmed raiders on the border; but they are a plucky race, as active over the hills as the Afridis, and next to them the best-armed large tribe on the frontier. The Mahsud country, especially that part within reach of British posts, is more difficult even than Tirah. To the south and east it is girt by an intricate belt of uninhabited, generally waterless hills and ravines. To the north a zone of Darwesh Khel territory, not less than 20 m. in width, hilly and difficult, separates the Mahsuds from the Tochi. The Tochi Valley is inhabited by a degraded Pathan tribe, known as Dauris, who have voluntarily placed themselves under British protection since 1895. In dealing with the Mahsuds it must be remembered that from Wana to Tank, from Tank to Bannu, and from Bannu to Datta Khel, or for a distance of over 200 m., British territory is open to Mahsud depredations. This area of frontier is equal to the whole Thal-Kohat-Peshawar-Malakand line, covering the eight or ten tribes that took part in the frontier risings of 1897. So that the Mahsuds should really be compared with the whole of those ten tribes, and not with any single one.

British expeditions were needed against various sections of the Waziris in 1852, 1859, 1860, 1880, 1881, 1894, 1897 and 1902.

The success of Sir Robert Sandeman in subduing the wild tribes of Baluchistan had led to a similar attempt to open Waziristan to British civilization; but the Pathan is much more democratic and much less subject to the influence of his maliks than is the Baluchi to the authority of his chiefs; and the policy finally broke down in 1894, when the Waziris made a night attack upon the camp of the British Delegation Commission at Wana. The Commission had been appointed to settle the boundary with the Afghans, and the Waziris regarded it as the final threat to their independence. The attack was delivered with such determination that the tribesmen penetrated into the centre of the camp, and it was only with the greatest difficulty that the lower limits of the country were regained from foes. A large force of 11,000 British troops subsequently traversed the tribal country, destroyed their towers and dictated terms, one of which was that the Tochi Valley should be occupied by British garrisons. But still there was trouble, which led to the Tochi expedition of 1897; and, in spite of the further lessons taught the Waziris in two expeditions in 1902, the attempt to "Sandemanise" Waziristan was given up by Lord Curzon. The British garrisons in the Tochi and Gomal valleys were withdrawn, and two corps of tribal militia, from 1300 to 1500 strong, were gradually formed to replace the British troops.

See Grammar and Vocabulary of Waziri Pathi, by J. G. Lorimer (Calcutta, 1902); Paget and Mason's Frontier Expeditions (1884); Mahsud Waziri Operations (1902), Blue-book.

WAZZAN, a small hillside town, 60 m. N.W. by N. of Fez, Morocco. It has a considerable trade with the country round, and manufactures a coarse white woollen cloth with rough surface from which the hooded cloaks (called jellāba) are made. Its proudest name is Dār D'manah—House of Safety—as it is sanctuary for any who gain its limits, on account of the tomb of a sainted Idris Sharif, who lived there in 1727. It is the head-quarters of his disciples.

WEALD, THE, a district in the south-east of England. It includes the portions of Sussex, Kent and Surrey which are enclosed between the North and South Downs—a district of Lower Cretaceous rocks encircled by Upper Cretaceous hills. It extends from Fnsenham and Petersfield on the Hampshire borders to the English Channel between Folkestone and Eastbourne. With the exception of the easternmost part, it drains by rivers running northward and southward through gaps in the downs, the origin of which is considered under that heading. The Weald was formerly covered by the forest of Andredeslaw or Andredesweald ("the wood or forest without habitations"), which was 120 m. in length and about 30 in greatest breadth. About 1660 the total area under forest was estimated at over 200,000 acres. The chief remains of the ancient forests are Ashdown, St Leonards and Tilgate, and the nomenclature often indicates the former extent of woodland, as in the case of Hurst-pierpoint (hurst meaning wood), Midhurst, Fernhurst, Billingshurst, Ashhurst and many others. The forests were interspersed with lagoons; and the rainfall being very great caused marshes, but it abated in consequence of the cutting down of the Wealden forests for fuel in the extensive ironworks that formerly existed in the district. The locality best preserving the ancient character of the Weald is the hilly district in the centre, forming a
picturesque broken range running east and west under the name of the Forest Ridges. This forms the main water-parting of the Weald, dividing the Vale of Sussex from the Vale of Kent; and was also the seat of the iron industry which was prosecuted by the Romans and probably earlier, reached its highest importance in the 16th and 17th centuries, and was maintained even till the early years of the 19th century. The Andredesleigh had an early history as a sub-division of the Weald. But this did not alter, as it had been thought, the fact that the South Saxons isolated from other Saxon kingdoms. Descending from over sea upon the coastal district of Sussex, to which they gave name, towards the close of the 6th century, they populated it thickly, and maintained independence, in face of the accretions of the West Saxons kingdom, for upwards of a hundred years.

**WEALDEN,** in geology, a thick series of estuarine and freshwater deposits of Lower Cretaceous age, which derives its name from its development in the Weald of Kent and Sussex. In the type area it is exposed by the denudation of a broad antiformal fold of which the higher Cretaceous beds have been removed. The Wealden rocks lie in the central part of this antiformal arch between the escarpments of the North and South Downs; they extend eastwards from the neighbourhood of Haslemere and Eland Chapel to the west between Pevensey and Hythe. This formation is divisible into two portions, the Weald Clay above and the Hastings Sands below. The Weald Clay which occupies the central, upland part of the area from Horsham to the sea coast consists of dark brown and blue clays and shales, occasionally mottled in the neighbourhood of sandy lenticles, which together with calcareous sandstones, shelly limestones and nodular ironstones, are characteristic of this bed. About Horsham the Weald Clay is 1000 ft. thick, but it decreases in an eastward direction; at Tunbridge it is only 600 ft. Certain subordinate beds within the Weald Clay have received distinctive names. "Hoxton stone" is a calcareous flaggy sandstone, often ripple marked, usually less than 5 ft. thick, which occurs at about 120 ft. above the base of the Clay. "Sussex marble" is the name given to more than one of the high limestone beds which are mainly composed of a large form of Paludina (F. fluviatum); some of the lower limestone layers contain a small species (P. sussexiensis). The Sussex marble (proper) occurs about 200 ft. below the top of the clays; it is the most important of the limestone beds, and its thickness varies from 6 ft. to 2 in.; it is known also as Bethoven marble, Петrow marble, Laughston stone, &c. It has been widely used in the Weald district in church architecture and for polished mantelpieces. The ironstones were formerly smelted in the western part of the area.

The Hastings Sands are divisible into three main subdivisions: the Tunbridge Wells Sand, the Wadhurst Clay and the Ashdown Sand. The Tunbridge Wells Sand and Wadhurst Clay are thickened as a whole towards the west. In the west, the Tunbridge Wells Sand is intercalated into an upper and lower division by the thickening of a bed of clay—the Grinstead Clay—which in the east, about Rye, &c., is quite thin; at Cuckfield a second clay bed 15 ft. thick divides the upper division. The upper beds of the lower Tunbridge Wells Sand cause good landscapes around West Hoathly and near East Grinstead. The Wadhurst Clay is very constant in character; near the base it frequently contains clay-ironstone, which in former times was the main source of supply for the Wealden iron industry. Much of the higher portion of the Hastings Sand country is made of the Ashdown Sands which consist of a fine-grained sandstone and sub-sandstone clays and sand beds; in the east, however, clay is strongly developed at the base of this group, and at Fairlight is more than 350 ft. thick, while the sandy portion is only 120 ft. These clays with sandy layers are known as the Fairlight Clays. Beds of thin coal are found in these beds, and a calcareous sandstone, called Tilate stone, occurs near the top of the Ashdown Sands and in the Wadhurst Clay. The old town of Hastings is built on Ashdown Sand, but St Leonards is mainly on Tunbridge Wells Sand.

Wealden beds occur on the southern side of the Isle of Wight and in the Isle of Purbeck in Dorsetshire. The Wealden antichute can be traced across the Channel into the same continent. A separate Wealden area exists in north Germany between Brunswick and Benthal, in the Ostervald and Teutoburger Wald, where the Delber Sandstone (160 ft.) corresponds to the Hastings Sands and the Tunbridge Sands to the Ashdown Sands. The formations contain valuable coal beds, worked in the neighbourhood of Oberkirchen, &c., and good building stone.

The fossils of the Wealden beds comprise freshwater shellfish, Unio, Paludina, Melanopsis, Cyrene; and estuarine and marine forms such as Ostrea, Exogyra and Mytilus. An interesting series of dinosaurs and pterodactyles has been obtained from the Wealden beds of Noord Brabant in the extreme north-west of Belgium, and towards the south-eastern coast of Europe, of which Iguanodon is the best known—a large number of almost entire skeletons of this genus were discovered in some buried Cretaceous valleys at Bernissart in Belgium; other forms are Heterosuchus, Ornithocheirus, Ornithopodes, Saurornithes and Thalattosaurus. Chara, Bennettites, Equisitis, Fulfenia, Sagenopetis and Tithuris. The fishes, plants and reptiles of these formations possess a decidedly continental aspect, and for this reason several authorities are in favour of retaining the Wealden rocks in that system, and the close relationship between this formation and the underlying Purbeckian, both in England and in Germany, tends to support this view.

See CRETACEOUS, NEOCPRICH:; also N. de W. Tulip, "Geology of the Weald," Mem. Geol. Survey (London, 1875.)

**WEALTH,** etymologically the condition of well-being, prosperity in its widest sense. The word does not appear in Old English, but is a Middle English formation, welle, on the O. Eng. wela, well-being, from wel, well, cognate with Dan. vel, Ger. wohl. The original meaning survived in the prayer for the King's Majesty of the English Book of Common Prayer, "Grant him in health and wealth long to live," and in "commonwealth," i.e. good of the body politic, hence applied to the body politic itself.

In economics, wealth is most commonly defined as consisting of all useful and agreeable things which possess exchange value, and this again is generally regarded as coextensive with all desirable things except those which do not involve labour or sacrifice for their acquisition in the quantity desired. On the other hand, wealth will be evidential of this definition, implies, directly, preliminary conceptions of utility and value, and indirectly, of sacrifice and labour, and these terms, familiar though they may appear, are by no means simple and obvious in their meaning. Utility, for the purposes of economic reasoning, is usually held to mean the capacity to satisfy a desire or serve a purpose (J. S. Mill), and in this sense is clearly a much wider term than wealth. Sunshine and fresh air, good temper and pleasant manners, and all the infinite variety of means of gratification, material and immaterial, are covered by utility as thus defined. Wealth, on the other hand, is a species of utility, and in order to separate it from other species some differentiation must be found. This, according to the general definition, is exchange value, but a little reflection will show that in some cases it is necessary rather to contrast value with wealth. "Value," says Ricardo, expanding a thought of Adam Smith, "essentially differs from riches, for value depends not on abundance but on the difficulty or facility of production." According to the well-known tables ascribed to Gregory King (1638-1712), a deficiency of a small amount in the annual supply of corn will raise its value far more than in proportion; but it would be paradoxical to argue that this rise in the demand will be evidential of a decrease in an important item of national wealth. Again, as the mines of a country are exhausted and its natural resources otherwise impaired, a rise in the value of the remainder may take place, and as the free gifts of nature are appropriated they become valuable for exchange; but the country can hardly be said to be so much the wealthier in consequence. And these difficulties are rather increased than diminished if we substitute for value the more familiar concrete term "money-price"—for the contrast between the quantity of wealth and its nominal value becomes more sharply marked. Suppose, for example, that in the total money value of the national income a decline is observed to be in progress, whilst at the same time, as is quite possible, an increase was noticed in the quantity of all the important items and an improvement in their quality, it would be in accordance with common sense to say that the wealth of the country was increasing and not decreasing.

So great are these difficulties that some economists (e.g. Ricardo) have proposed to take utility as the direct measure of wealth; and, as H. Sidgwick has pointed out, if double the quantity meant double the utility this would be an easy and natural procedure. But even to the same individual the increase in utility is by no means simply proportioned to the increase in quantity, and the utility of different commodities to different
individuals, and a fortiori of different amounts, is proverbial.

The very same things may to the same individual be productive of more utility simply owing to a change in his tastes or habits, and a different distribution of the very same things, which make up the wealth of a nation, might indefinitely change the quantity of utility; but it would be paradoxical to say that the wealth had increased because it was put to better uses.

We thus seem thrown back on value as the essential characteristic, allowance being made for any change in the standard of value; but there are still difficulties to be overcome. Some things that undoubtedly possess value or that can command a price are immaterial, e.g. the advice of a lawyer or physician. Had the meaning of a prima donna, and, although perhaps the skill of a workman (in any grade of the social scale) might be considered as attached to the man, as a coal mine is attached to a place, it is more in accordance with popular usage to consider skill as immaterial, whilst at the same time it seems equally natural prima facie to confine the term wealth to material things in the common sense. Again, the credit system of a country is a product of great labour and sacrifice, it is most closely connected with the production of its material wealth in the narrowest sense, and it certainly commands a pecuniary value, and yet credit is more generally held to be a representative rather than a property, and, having apparently to its insubstantial character. Apart from the question of materiality some writers have insisted on relative permanence and possibility of accumulation as essential attributes of wealth, and have thus still further narrowed the scope of the definition.

There can be no doubt that it is on many grounds desirable in economics to use terms as far as possible in their popular acceptations; but this rule must always be subordinate to the primary object in view. In nearly every department of knowledge in which popular terms have been retained it has been found necessary either constantly to use qualifying adjectives where the context is not a sufficient guide, and in some cases, when analysis discloses very different elements, to make a selection. Sometimes it has been found convenient to use a term with some variation in the definition according to the branch of the subject in hand.1 Applying these rules to the definition of wealth, perhaps the best solution is that which is generally connected with German economists (e.g. Adolf von Held). Wealth consists of utilities, and in the first great department of economics—

**WEAPON—WEASEL**

Usually, however, it will be found that in most cases anything which can fairly be classed as wealth in one department is also wealth in the others, and thus the definition is reached that wealth in general consists of all "consumable utilities which require labour for their production and can be appropriated and exchanged." It only remains to add that "utilities" may be divided into "inner" and "outer" (to translate the German literally)—the "inner" being such as are simply sources of personal gratification to their possessor, e.g. a good ear for music; the "outer" utilities again may be divided into "free" and "economic," the former, as a rule, e.g. sunlight, not being the result of labour and not capable of appropriation or exchange, and the latter as a rule possessing each of these marks. It is these "economic utilities" which constitute wealth in the specific sense of the term, although its use may be extended by analogy to include almost all utilities.

See A. Marshall, Principles of Economics (1907); J. B. Clark, Philosophy of Wealth (1886) and Distribution of Wealth (1899); W. E. Hearn, Plutology (1886); F. A. Walker, Political Economy (1888); and J. S. Nicholson, Principles of Political Economy (1903).

**WEAPON** (O. Eng. wapen, cf. Du. wapen, Ger. Waffe, also Wappen, a coat of arms, heraldic shield), any instrument of offence or defence, more usually a term confined to offensive or attacking instruments. The general sketch of the history and development of weapons of offence and defence is given under ARMS AND ARMOUR; particular weapons are treated under such heads as HALBERD, LANCE, SPEAR, SWORD, GUN, PISTOL, RIFLE, ORDNANCE AND MACHINE-GUNS.

**WEAR**, a river of Durham, England, rising in the Pennine chain near the Cumberland border, and traversing a valley about 60 m. in length to the North Sea, with a drainage area of 43 sq. m. A series of streams draining from the hills between Killhope Law and Burnhope Seat (2452 ft.) are collected at Wearhead, up to which point the valley is traversed by a branch of the North-Eastern railway. Hence eastward, past the small towns of St John's Chapel and Stanhope, and as far as that of Wolsingham, Weardale is narrow and picturesque, sharply aligned by high-lying moorland. Below, it takes a south-easterly bend as far as Bishop Auckland, then turns northward and north-eastward, the course of the river becoming extremely sinuous. The scenery is particularly fine where the river sweeps round the bold peninsula which bears the cathedral and castle of the city of Durham. The valley line continues northerly until Chester-le-Street is passed, then it turns north-east; and soon the river becomes navigable, carrying a great traffic in coal, and having its banks lined with factories. At the mouth is the large seaport of Sunderland.

**WEASEL** (Mustela nivalis), the smallest European species of the group of mammals of which the polecat and stoat are well-known members (see CARNIVORA). The weasel is an elegant little animal, with elongated slender body, back much arched, head small and flattened, ears short and rounded, neck long and flexible, limbs short, five toes on each foot, all with sharp, compressed, curved claws, tail rather short, slender, cylindrical, and pointed at the tip, and fur short and close. The upper-parts, outside of limbs and tail, are uniform reddish brown, the under-parts white. In cold regions the weasel turns white in winter, but less regularly and only at a lower temperature than the stoat or ermine, from which it is distinguished by its smaller size and the absence of the black tail-tip. The length of the head and body of the male is usually about 8 in., that of the tail 2½ in.; of the female about 7½ in. and 1½ in., respectively. It is distributed throughout Europe and Northern and Central Asia; and is represented by a closely allied animal in North America. It possesses all the active, courageous and bloodthirsty disposition of the rest of the genus, but its diminutive size prevents it attacking and destroying any but the smaller mammals and birds. Mouse, rats, water-rats and moles, as well as frogs, constitute its principal food. It is generally found on or near the surface of the ground, but it can not only pursue its prey through holes and crevices of rocks and under dense tangled herbage, but follow it up the

WEATHER—WEAVER-BIRD

439

It nests by the Tisserin from Viduinae, which in 1847 was raised by J. Cabanis to the rank of a family Placeinæ, which has since been generally admitted, though the grounds for taking it as such could not be held valid in any other order than that of Passeres. The Placeinæ are closely related to the Fringillidæ (see Finch), and are now divided into two subfamilies, the Placeinae and Vidinae, the former chiefly found in Africa and its islands, the latter in the Ethiopian, Australian and Indian regions.

Perhaps the most typical Placeinæ weaver-bird is Hyphomenotornis cucullata, an African species, and it is to the Ethiopian Region that by far the greatest number of these birds belong, and in it they seem to attain their maximum of development. They are all small, with, generally speaking, a sparrow-like build; but in richness of colouring the males of some are very conspicuous—glowing in crimson, scarlet or golden-yellow, set off by jet-black, while the females are usually dull in hue. Some species build nests that are very remarkable, except in being almost invariably domed—others (such as the most typical Indian weaver-bird, Ploceus baya) fabricate singular structures of closely and uniformly interwoven tendrils or fine roots, that often hang from the bough of a tree over water, and, starting with a solidly wrought rope, open out into a globular chamber, and then contract into a tube several inches in length, through which the birds effect their exit and entrance. But the most wonderful nests of all, and indeed the most wonderful built by birds, are those of the so-called sociable grosbeak, Philibitor socius, of Africa. These are composed wholly of grass, and are joined, i. e. gathered together by more than 1,000—indeed 320 are said to have been found in one of these aggregated masses, which usually take the form of a gigantic mushroom,2 affording a home and nursery to many pairs of the birds which have been at the trouble of building it. These nests, however, have been so often described and figured by South African travellers that there is no need here to dilate longer on their marvels. It may be added that this species of weaver-bird, known to French writers as the Républicain, is of exceptionally dull plumage.

The group of widow-birds, Viduaæ, is remarkable for the extreme development of tail-feathers in the males at the breeding-season. In the largest species, Vidua (sometimes called Chera) prope, the cock-bird, which, with the exception of a scarlet and buff bar on the upper wing-coverts, is wholly black, there is simply a great elongation of the rectrices; but in V. paradisa the form of the tail is quite unique. The middle pair of feathers have the webs greatly widened, and through the twisting of the shafts their inferior surfaces are vertically opposed. These feathers are comparatively short, and end in a hair-like filament. The next pair are produced to the length of about a foot—the bird not being so big as a sparrow—and droop gracefully in the form of a sickle. But this is not all: each has attached to its base a hair-like filament of the same length as the feather, and this filament originally adhered to and ran along the margin of the outer web, only becoming detached when the feather is fully grown.5 In another species, V. principalis, the middle two pairs of rectrices are equally elongated, but their webs are convex, and the outer pair contains the inner, so that when the margins of the two pairs are applied

1 First bestowed in this form apparently by J. F. Stephens in 1826 (G. Shaw’s Gen. Zoology, xxi. pt. i. p. 34); but in 1782 J. Latham (Synopsis, i. p. 435) had called the “Trospia du Senegal” of Buffon the “weaver oriole,” from its habit of entwining the wires of the cage in which it was kept with such vegetable fibres as it could get, and hence in 1788 Cuvier named it Oriolus textor. In 1800 F. M. Daudin used the term “Tisserin” for several species of the Linnaean genus Loxia, and this was adopted some years later by Cuvier as the equivalent of his Ploceus, as mentioned in the text.

2 These differ from those built by some of the Oriolus (g.v.) and other birds, whose nests may be compared to penny packets, while those of these weaver-birds can best be likened to a stocking hung up by the “toe,” with the “heel” enlarged to receive the eggs, while access and exit are obtained through the “leg.”

3 But at a distance they may often be mistaken for a native hut, with its grass-roof.

4 It has been ingeniously suggested that this name should be more correctly written Whydah-bird—from the place on the West Coast of Africa so named; but Edwards, who in 1745 figured one of the species, states that he was informed that the Portuguese call this bird the widow, from its colour and long train (Nat. Hist. 1826, ii. 196).

5 This curious structure was long ago described by Brisson (Ornithologie, iii. p. 123), and more recently by Strickland (Contr. Ornithology (1850), pp. 88 and 149, pl. 99).
a sort of cylinder is formed. The females of all the widow-birds differ greatly in appearance from the males, and are generally clothed in a plumage of mottled brown.

Usually classed with the weaver-birds is a vast group of small seed-eating forms, often called Spermestinae, but for which Estrildinae would seem to be a better name, for they are closely related to the numerous species so commonly seen in cages, and known as amazons, Estrilda amandava, nutmeg-birds, Munia punctulitoria, wax-bills, Psittaca melba and phoeniciophora, cutroheads, Amazina fasciata, the olive-colored thrush, and many others. Many of these genera are common to Africa and India, and some also to Australia.

A. N.)

WEAVING. The process of weaving consists in interlacing, at right angles, two or more series of flexible materials, of which the longitudinal are called warp and the transverse weft. Weaving, therefore, only embraces one section of the textile industry, for felted, plaited, netted, knitted, and lace fabrics lie outside this definition. Felting consists in bringing masses of loose fibres, such as wool and hair, under the combined influences of heat, moisture and friction, when they become firmly interlocked in every direction. Plaited fabrics have only one series of threads interlaced, and those at other than right angles. In nets all threads are held in their appointed places by knots, which are tied wherever one thread intersects another. Hosiery fabrics, whether made from one or many threads, are held together by interjecting a series of loops; while lace fabrics are formed by passing one set of threads between and round small groups of other threads, instead of moving them from side to side. Notwithstanding the foregoing limitations, woven fabrics are varied in texture and have an enormous range of application. The demands made by prehistoric man for fabrics designed for clothing and shelter were few and simple, and these were fashioned by interlacing strips of fibrous material and grasses, which in their natural condition were long enough for the purpose in hand. But, as he passed from a state of savagery into a civilized being, his needs developed with his culture, and those needs are still extending. It no longer suffices to minister to individual necessities; luxury, commerce and numerous industries must also be considered.

The invention of spinning (q.v.) gave a great impetus to the introduction of varied effects previously; the use of multicoloured threads provided ornament for simple structures, but the demand for variety extended far beyond the limits of colour, and different materials were employed either separately or conjointly, together with different schemes of interlacing. Eventually the weaver was called upon to furnish articles possessing lustre, softness and delicacy; or those that combine strength and durability with diverse colours or patterns, or with elaborate patterns or the ornamentation. In cold countries a demand arose for warm clothing, and in hot ones for cooler materials; while commerce and industry have requisitioned fabrics that vary from normal characteristics to those that exceed an inch in thickness. In order to meet these and other requirements the world has been searched for suitable raw materials. From the animal kingdom, wool, hair, feather, silk and the pinnà fibre have long been procured. From the vegetable kingdom, cotton, flax, hemp, jute, ramie and a host of other less known but almost equally valuable fibres are derived; and minerals, as iron, gold, silver, copper, brass, iron, glass and asbestos. In addition, strips of paper, or skin, in the plain, gilt, silvered and painted conditions are available as well as artificial fibres. All of the foregoing may be used alone or in combination.

From such varied raw materials it is not surprising that woven fabrics should present an almost endless variety of effects; yet these differences are only in part due to the method of weaving. The processes of bleaching (q.v.), mercerizing (q.v.), dyeing (q.v.), printing (see TEXTILE PRINTING) and finishing (q.v.) contribute almost as much to the character and effect of the resultant product as do the incorporation in one fabric of threads spun in different ways, and from fibres of different origin, with paper, metal, beads or even precious stones.

Both these species seem to have been first described and figured in 1600 by Aldrovandus (lib. xv. cap. 22, 23) from pictures sent to him by Ferdinando de' Medici, duke of Tuscany.

INDUSTRIAL TECHNOLOGY

All weaving schemes are reducible to a few elementary principles, but no attempted classification has been quite successful, for fabrics are constantly met with that possess characteristics supposed to be peculiar to one class, but lack others which are deemed equally typical. Nevertheless, since some classification is essential, the following will be adopted, namely: Group 1, to include all fabrics made from one warp and one weft, produced both sets of threads remaining parallel in the finished article and are intersected to give the required design and appearance. Group 2, to include (a) fabrics constructed from two warps and one weft, or two wefts and one warp, as in those that are backed, reversible and figured with extra material; (b) two or more distinct fabrics built simultaneously from two or more warps and wefts, as in two, three and other ply cloths; (c) fabrics built by so intersecting two or more warps and wefts that only one texture results, as in loom-made tapestries and figured repps. Group 3, to include fabrics in which a portion of the warp or weft rises vertically from the groundwork of a finished piece, as in velvet and velvet paints, and in puddled carpets. Groups 4, to embrace all fabrics in which one portion of the warp is twisted partially, or wholly, round another portion, as in guazes and lappet cloths. Although some fabrics do not appear to fall into any of the above divisions, and in others the essential features of two or more groups are combined, yet the grouping enumerated above is sufficiently inclusive for most purposes.

The fabrics included in Group 1 are affected by the nature and closeness of the yarns employed in their construction, by colour, or by the scheme of intersecting the threads. The most important section of this group is Plain Cloth, in which the warp and weft threads are approximately equal in thickness and closeness, and which includes the most extensive and under which most other alternatives are grouped. A simple example is shown in fig. 1, which shows a design, plan and two sections of plain cloth. Such a fabric would, therefore, appear to admit of but slight ornamentation, yet this is by no means the case, for if thick and thin threads of warp and weft alternate, the resultant fabric may be made to assume a corrugated appearance on the face, while beneath it remains flat, as in poplins, repps and cords. A plan and a longitudinal section of a repp cloth is shown at fig. 2. Colour may also be employed to ornament plain fabrics, and its simplest application produces stripes and checks. But colour may convert these fabrics into the most artistic and costly productions of the loom, as is the case with tapestries, which are at once the oldest and most widely diffused of ornamented textiles. Tapestries only differ from simple plain cloth in having each horizontal line of weft made up of numerous short lengths of parti-coloured thread. Many fine specimens of this art have been recovered from ancient Egyptian and Peruvian tombs, and many are still produced in the Gobelins and other celebrated manufactories of Europe.

Twills are next in importance to plain cloth on account of their wide range of application and great variety of effects; in elaborately figured goods their use is as extensively employed as the only ornament. Twills invariably form diagonal ribs in fabrics, and these are due to the intervals at which the warp and weft are intersected, thus two or more warp threads are required over or under one or more than one weft thread in regular succession. Twills are said to be equal when similar quantities of warp and weft are upon the face of a fabric, unequal when one set of threads greatly preponderates over the other set, as in figs. 3, 4, which require equal warp and weft threads to complete the scheme of intersections. If the ribs form angles of 45 degrees, the warp and weft threads per inch are about equal in number, but for an unequal twill the material must be comparatively fine. The angle formed may be greater or less than 45 degrees, as in figs. 5, 6; if greater, the warp preponderates, if less, the weft preponderates. Twills are simple and fancy; both terms refer to the schemes of intersecting. In the

Fig. 1.—Plain Cloth.  
Fig. 2.—Repp Cloth.
WEAVING

The former the same number of warp threads are placed successively above or below each weft thread, and the ribs are of uniform width, as in figs. 3, 4. In the latter more warp threads may be above one pick than another, the ribs may vary in width and small ornament may be introduced between the ribs, as in figs. 5, 6 and 7, where the dark squares represent warp upon the surface. Twills may be broken up into zigzags, lozenges, squares and other geometrical designs, all of which may be produced by reversing in the diagonal lines, or by reversing the weave of an uneven twill. Fig. 8 is a zigzag, namely, a twill reversed in one direction. Fig. 9 is a diamond, or a twill reversed in two directions, and fig. 10 is a diaper, or an unequal twill which gives a warp face in one place and a weft face in another. Satins and sateens form another important section of Group 1. In a satin the bulk of the warp, and in a sateen the bulk of the weft, is on the face of a fabric. If perfect in construction both present a smooth, patternless appearance, which is due in part to the scheme of intersections, in part to using fine material for the surface threads and placing it close enough together to render the points of intersection invisible; the threads of the other set being coarser and fewer in number. Satins differ from twills in having each warp thread lifted, or depressed, separately, but not successively. From five to upwards of thirty threads of warp and weft are required to complete the various schemes of intersecting. If the intervals between the intersections are equal the weave is said to be perfect, as in fig. 11, but if the intervals are irregular it is said to be imperfect, as in fig. 12. In Damasks a satin is combined with a satteen weave, and since any desired size and shape of either weave may be produced, great facilities are offered for the development of all kinds of ornamentation. But in combination neither the satin nor the satteen can be perfect in construction, for one requires a preponderance of warp, the other a preponderance of weft; as a sequence every point of intersection is distinctly visible on both surfaces. Brocades are fabrics in which both sets of threads may be floated irregularly upon the surface to produce ornamental effects, and they may be taken as typical of all one warp and one weft fabrics that are figured by irregularly floated materials, whether the threads are uniformly or irregularly distributed, and whether one weave or several weaves are employed. Group 2 includes all back and reversible fabrics, as well as those ornamented with extra material and compounded. Cloths intended for men’s wear are often backed, the object of which is to give weight and bulk to a thin texture without interfering with the face effects. Either warp or weft may be used as backing: if the former there are two series of warp to one series of weft threads, while in the latter there are two series of weft to one series of warp threads. The face material is superposed upon that of the back, but the ratio of face threads may be one or two to one of back. In order to avoid disturbing the face weave, only those threads are used to bind the backing that are hidden on the face, as in fig. 13, which gives the design and a transverse section of a backed fabric: A is face weft; B back weft, and the circles are warp threads; of the latter C, D, are beneath both B and A. This diagram will serve equally as a longitudinal section of a warp-backed fabric, if A represents a thread of face warp, B a thread of back warp and the circles are weft threads. Weft backing is capable of giving a more spongy feel to a fabric than warp, because softer materials may be used, but in these fabrics the length output of loom is reduced by reason of the wefts being superposed. Warp-backed fabrics, whether uniformly coloured or striped, do not materially reduce the output of a loom, for every weft thread adds to the cloth length. Reversible fabrics may have either two series of differently coloured wefts or warps to one of the other series, in which event they may be similarly figured on both sides by causing the threads of the double series to change places, as in the design and transverse section, fig. 14; or by allowing one series to remain constantly above the other, as in backed cloths, both sides may be similar or dissimilar colour and pattern. Fabrics figured with extra material may have two series of warp or weft threads to one series of the other set, and they may yield reversible or one-sided cloths. A ground texture may have extra material placed above or below it, as in fig. 15, where a design and transverse section of the cloth are given; the waved lines and circles represent a cross-section of plain cloth and A is a thread of extra material; or ordinary and extra material may be used conjointly for figuring. Compound cloths must have at least two textures, and be as distinct in character as if woven in separate looms: they have many advantages over backed cloths, because the same design and colouring may be produced on both sides; where bulk and weight are required a fine surface texture may be formed over a ground of inferior material, and soft weft may be passed between the upper and lower textures. The fabric is more perfect and admits of either simple or elaborate patterns being wrought upon the surface, with simple ones beneath, as in piqûres and matelassés. One texture may be constantly above the other and connected at the selvages only, as in hose pipes and pillow slips; or at intervals a thread may pass from one texture into the other, in which event both are united, as in many styles of bed-covers and vestings. If differently coloured, the textures may change places at pleasure, as in Kidderminster carpets; or, from three to twelve textures may be woven simultaneously, and united, as in belting cloth. There may be from one to three threads of face warp to one of back, and the wefting may or may not correspond with the warping. Fig. 16 shows the face and
WEAVING

INDUSTRIAL TECHNOLOGY

back weaves, the design, and a transverse section of a compound cloth with the warp threads of one face and the weft threads of the other, both are stitched together. The circles in the upper and lower lines represent face and back warps respectively, and A, B, C are weft threads placed in the upper and lower textures. Loom-made tapestry figured weaves are by far the most popular, and are represented in the next section of Group 2. As compared with true tapestries, the loom-made articles have greater freedom of colour and design, and the figured effect obtained may be obtained from warp as well as weft, whether interlaced to form a plain face, or left floating more or less, and design on the backside. If passing from selvage to selvage, it is covered to the surface, where required, the other screens being bound back at the back. Some specimens are reversible, others are not, but, however numerous the warps and wefts, only one texture is produced. When an extra warp of figured, or the figured, and the plain, are woven together, the weave shows on both sides. If a single warp is employed, two or more wefts form the figure, and the warp seldom floats upon the surface. Where warps do form the figure it rarely happens that more than three can be used without overpowering the red.

Fig. 17 gives the design, and a transverse section of a reversible tapestry in four colours, two of which are warps and two wefts. The flowers on the surface, corresponding threads are beneath. The bend lines represent weft and warp threads, and no reverse figure is obtained from plain ones in having threads of one, or more than one, thick fibres of a thick and thin texture; and, or, in having other threads from which a fixed number of a single warp and two wefts are removed. In the latter case, the warp thread is removed, the loom all threads are cut by pushing a knife lengthwise between the plain cloth and the pile. As each pick is formed, pieces rise vertically and the fibres open out as at B. Since the pile threads are from two to six times as numerous as the ground threads, and from an immense number of places, a uniform brush-like surface is formed. Raised figures are produced by carrying the threads A beneath the ground cloth, where no figure is obtained. The knife is to be applied to those portions of the pile weft that remain on the surface. The effect upon the face varies with the distribution of the binding points, and the length of pile is determined by the distance separating one point from another.

Chenille.—When chenille is used in the construction of figured weft-pile fabrics it is necessary to employ two weaving operations, namely, to furnish the chenille, the other to place it in the final fabric. Chenille is made from groups of warp threads that are separated from each other by considerable intervals; then, multicoloured wefts are passed from side to side in accordance with a predetermined scheme. This fabric is next cut midway between the groups of warp into longitudinal strips, and, if reversible fabrics such as table-covers and curtains are required, each strip is twisted axially, the warp threads from the centre of the fabric, and form a cylinder of pile. In the second weaving this chenille is folded back and forward in a second warp to lay the pile threads in their appointed places and pile projects on both sides of the fabric. If chenille is intended for light warps, the ends of the pile are bent in one direction, and then woven into the upper surface of a strong ground texture.

Velvets and Plushes have at least two series of warp threads to one of weft, and are more varied in structure than weft-piled fabrics, because they may be either plain or figured, and have their surfaces cut, looped, or both. Velvets and Plushes are woven single and double. In the former case both ground and pile warps are interlaced with the weft, but at intervals of two or three picks the pile threads are lifted over a wire, which is subsequently withdrawn. The pile threads are bound with a knot at its outer extremity, in withdrawing it the pile threads are cut, but if the wire is pointed a line of loops remains, as in terry velvet. Fig. 19 is the design, and two longitudinal sections of a Utrecht velvet. The circles A are weft threads, the bent line is a pile thread, part of which is shown cut, another part being looped over a wire. At B the circles are repeated to show how the ground warps interlace with the weft. Double Plushes consist of two distinct ground textures which are kept far enough apart to ensure the requisite length of pile. As weaving proceeds the pile threads are interlaced with each series of ground threads, and the other. The pile material is next severed midway between the upper and lower textures, and two equal fabrics result. Fig. 20 gives three longitudinal sections of a double pile fabric. The circles A, B are warp threads in the upper and lower fabrics respectively; the lines of interface with these wefts are pile warp threads which pass vertically from one fabric to the other. At C, D the circles are repeated to show how the ground warps interlace the wefts, and at E the arrows indicate the butt warps or wefts. Figured Warp-pile Fibres are made with regular and irregular cut and looped surfaces. If regular, the effect is due to colour, and this again may be accomplished in various ways, such as (a) by knotting tufts of coloured threads upon a warp, as in Eastern carpets; (b) by printing a fabric after it leaves the loom; (c) by printing each pile thread before placing it in a loom, so that a pattern shall be formed simultaneously with a pile surface, as in tapestry carpets; (d) by providing several sets of pile threads, no two of which are similar in colour; in those, if five sets are available, one-fifth of all the pile warp must be lifted over each edge, but any one of five colours may be selected that differ in colour or costume as in Brussels and Wilton carpets. Fig. 21 is the design, and a longitudinal section of a Brussels carpet. The circles represent two tiers of weft, and the lines of pile threads, when not lifted over a wire to form loops, are laid between the wefts; the ground warp threads with the pile to bind the whole together. When the surface of a piled fabric is irregular, also when cut and looped pile are used in combination, the pile is more dependent upon colour, for in the Fig. 22—Plain Gauze.

Plain Gauze embodies the principles that underlie the construction of all crossed woven textiles. In these fabrics the twisting of two warp threads together leaves large interstices between both warp and weft. But although light and open in texture, gauze fabrics are the thinnest that can be made from a given quantity and quality of material. One warp thread from each pair is made to cross the other very near, and the ground thread to the left alternately, therefore the same threads are above every pick, but since in crossing from side to side they pass below the remaining threads, all are bound securely together, as in fig. 22, where A is a longitudinal section and B a plan of gauze.

Punch Gauze may be made in many ways, such as (a) by using crossing threads that differ in length from the remaining threads, provided they are subjected to slight tensile strain; (b) by causing some to twist to the right, others to the left simultaneously; (c) by combining a gauze with another weave, as plain twill, satin, brocade or pile; (d) by varying the number of threads that cross, and by causing those threads to entwine several ordinary threads; (e) by passing two or more warp threads into each weft, and operating any assortment of crossing threads at pleasure.
WEAVING

Lappet weaving consists in diapering the surface of a plain or gauze fabric with simple figures. This is done by drawing certain warp threads into a transverse position and then lifting them over a thread of weft to fix them in the texture; after which they are moved in the opposite direction and lifted over the following pick. The material between one binding point and another must float loosely, and this limits the usefulness of lappet figuring. In fig. 23, the thick lines show a lappet spot upon a plain texture. Notwithstanding diverse structure, intricate mechanisms are not essential to the production of either simple or complex textures; the most elaborate and beautiful specimens of the weaver’s art have been manufactured upon simple machinery.

Weaving Machinery.

The longitudinal threads of a fabric are called warp, caine, twist and organize, and the transverse threads are weft, shoot, wool, filling and tram. A loom for intersecting these several threads must provide for: (1) Shedding; namely, raising and lowering the warp threads in a predetermined sequence so as to form two lines between which the weft may be passed. (2) Picking, or placing lines of weft between the divided warp. (3) Beating-up, or striking each weft thread into its appointed position in the fabric. (4) Letting-off, or holding the warp tense and delivering it as weaving proceeds. (5) Taking-up, or drawing away the cloth as manufactured. (6) Temple, for stretching the fabric widthwise in order to prevent the edge threads of a warp from injuring the reed, and from breaking. Power looms require the above-named contrivances to act automatically, and in addition: (7) A weft-fork, to stop a loom when the weft becomes exhausted or breaks. (8) Mechanism for stopping a loom when the shuttle fails to reach its appointed box. (9) For weaving cross stripes, multiple shuttle boxes are needed to bring different colours, or counts of weft, into use at the proper time. (10) In some looms a device for automatically ejecting a spent cop, pin or shuttle, and inserting a full one, is requisite. (11) If a weaver has to attend to a greater number of looms than usual, a device for stopping a loom when a warp thread fails is essential.

The Hand-Loom.—During the 17th and the first half of the 18th centuries it was observed that wherever any branch of the textile industry had been carried to a high state of excellence the looms are laid in open steps formed in the loom framing. Two ropes are coiled round this beam, and weighted to prevent the warp from being given off too freely. From the beam the threads pass alternately over and under two fixed rods, the shuttle passing through the eyes of the shedding harness, in pairs between the dents of a reed, and finally they are attached to a cloth roller. For small patterns heads are used to form sheds, but for large ones a Jacquard machine is required. Heads may be made to shed, or to pick up, into which metal eyes, called mails, are threaded. But they usually consist of a number of strings which are secured above and below upon wooden laths called shafts, and each string is knotted near the middle to form a small eye. From two to twenty-four pairs of shafts may be employed, but the heads they carry must collectively equal the number of threads in the warp. These heads will be automatically discharged in the same order as in the nature of the pattern to be woven, and the threads will be drawn through the eyes in a predetermined order. The upper shafts are suspended from pulleys or levers, and the lower ones are attached directly to batten or to a weight placed near the floor. The weaver depresses these treadles with his feet in a sequence suited to the pattern, and the scheme of drawing the warp through the heads.

Fig. 25.—Weaver’s Reed.

by which weft is beaten into position in the cloth; it also determines the closeness of the warp threads, and guides a moving shuttle from side to side. It is made by placing strips of flattened wire between two half round ribs of wood, and binding the whole together by passing tarred twine between the wires and round the ribs. Such a reed is placed in the lower portion of a batten, which is suspended from the upper framework of the loom. In front of the reed, and immediately below the warp, the projecting batten forms a race for the shuttle to travel upon from side to side. Before Kay’s invention a shuttle was thrown between the divided warp and caught at the opposite selvage, but Kay continued the projecting batten on both sides of the warp space, and was the first to make the shuttle pass through each box he mounted a spindle, and upon it a driver, or picker. Bands connected both pickers to a stick which the weaver held in his right hand, while with the left hand he controlled the batten. Thus: a tredle is pressed down by one foot to form a shed; the batten is pushed back till a sufficient portion of the shed is brought in front of the reed, and the depressed threads lie upon the shuttle race; a clear way is thus provided for the shuttle. A quick movement of the stick tightens the cord attached to a picker and presents the shuttle from one box to the other. The batten is now drawn forward, and the reed beats up the weft left by the shuttle. As the next shuttle is depressed to form another division of the warp for the return movement of the shuttle, the last length of weft is enveloped between intersecting warp threads, and the remaining movements follow in regular succession (see fig. 26).

In cases where the weft forms part of the design across a fabric, also where different counts of weft are used, shuttles, equal in number

Fig. 24.—Diagram of Hand-Loom.

used to manufacture a given fabric were similar in essentials, although in structural details they differed greatly. Prior to the invention of the fly shuttle by John Kay, in 1733, no far-reaching invention had for generations been applied to the hand-loom, and subsequently the Jacquard machine and multiple shuttle boxes represent the chief changes. A hand-loom as used in Europe at the present time (see fig. 24) has the warp coiled evenly upon a beam whose guides
WEAVING

control of a warp thread. The strings passed through a drilled board which held the mails and warp threads facing the proper reed dents. Still higher up, groups of strings were connected to neck cords; each group consisted of all strings required to rise and fall together in the same manner. Additionally, there were twelve repeats of a design, twelve strings would be tied to the same neck cord, but taken to their respective places in the comb board. The foregoing points are clearly shown in fig. 27. A is line formed for every shed required and they were pulled in succession by the draw-boy, while the weaver attended to the batten and picking.

The Jacquard machine is that most important invention ever applied to the handloom, but it is not the work of one man; it represents the efforts of several inventors whose labours extended over three-quarters of a century. This apparatus has taken the places of the simple, the loops, the pulleys and the draw-boy of the older shedding motion, but other parts of the harness remain unchanged. In 1725 Basile Bouchon substituted for the bunches of looped string an endless band of perforated paper by which the simples for any shed could be selected. In 1728 M. Falcon constructed the machine since known as the Jacquard and operated it through the medium of perforated cards, but it was attached to the simple cords and required a drum of the conical shape, and restored to the needles by each downward movement, so that each face in succession is presented to the needles, and each rotatory movement brings forward a fresh card. As the griffe rises with vertical head, the bunched string is replaced in the cylinder by a new one. As the shed descends to the original position, the whole cycle is repeated. The Jacquard system has undergone many modifications, and its present state is that in which it is worked in the modern loom. The most far-reaching changes are directly due to efforts made to adapt the Jacquard to fast running power looms. Alfred Barlow, John and William Crossley, and others, devised means whereby two cards could control the same warp thread, and they provided the machine with two griffes, each capable of actuating alternate rows of hooks. One griffe was caused to ascend as the other descended, thus making it possible to raise more than one shed simultaneously, and to give greater certainty of action to the moving parts.弱点

Preparing Warp and Weft for Weaving.—The power loom is only one of a series of machines which revolutionized weaving. Although various mechanical devices have been invented to mechanize the weaving process, the commercial results were disappointing, chiefly because means had not been devised for preparing warp and weft in a suitable manner for such a machine.

Warp Winding.—Warp yarns invariably receive simpler treatment than weft yarns. The component operations of winding and gauging pass direct to the loom unless their dimensions are unsuited to the shuttles, in which case they, together with wefts, are wound on bobbins or coils in a suitable manner. Winding operations are performed by winding machines which vary in construction, but the majority are furnished with conical shuttles, consisting either of slip cups, or of cone rollers mounted upon spindles. A pin, whose head is coned to fit the shuttle, is wound on a bottom, either vertically or horizontally, through a shaver; the lower end of the spindle being flattened to enter a rectangular hole in a wharve which is driven from a central motor, connected to the shuttle by a sliding guider leads it to and fro inside the shuttle. Both spindle and pin recede from the shuttle until the pin is full, when they become stationary. Hanks are carried by yokes, and coils and ring spools are used. Each of these four methods of holding the loom is subject to various types of shafts, which they coil upon bare spindles. By this means a greater length of weft can be placed in a shuttle than when pins are used.
**WEAVING**

Warp winding consists in transferring yarn from cops, ring spools or hanks, either to warps, bobbins or cheeses (see Cotton-Spinning Machinery). Machines for this purpose are of two kinds, which are known respectively as spindle and drum. In the former each bobbin, or "spindle," is provided with a separate mechanism to place the yarn on it; or a yarn guide moves laterally to and fro; slowly for a bobbin, but quickly for a tube.

**Warping.**—The number of longitudinal threads in a web varies according to the nature of the material to be woven and its desired thickness. In these respects the warp has to provide a sufficient number of parallel threads for a web, all of equal length, and to retain their parallelism. Warpers are of three types, viz., mill, beam and sectional.

In a mill warper, the threads pass through a number of guides in extensive use. A mill warper has a creel in which 50 to upwards of 300 bobbins or cheeses are supported horizontally upon pegs, and the mill has a vertical axis. Warps are made to the bobbins as they are required; the ones are fixed about 1 ft. apart to form a reel, from 5 to upwards of 20 yds., in circumference. The threads from the creel are threaded in succession through leasing needles, then passed in groups of four to twenty threads between runners, and, finally, fastened by a peg to the mill staves. The needles are mounted alternately in two frames which may be moved up inclined planes; one to elevate odd threads, the other even, and these are separated upwards by pegs, this is the license which enables a weaver to readily fix the position of a broken thread. As the mill rotates the threads form a tape about 1 in. wide, and the leasing apparatus is allowed to pass, to form a warp. When the full length of warp has been made the mill is stopped, a half beer lease is picked by hand from the divisions formed by the runners, and also retained upon pegs. The mill next reverses its direction and the last 20 sections of threads are folded back upon themselves. Hence, if a reel is 20 yds. in circumference, and 200 threads are in use to make a warp 600 yds. long, and the warp is to be satinated, the mill must be reversed 300 times, with 36000 revolutions of its axis horizontally the leasing apparatus must slide horizontally.

**Winding on Beam.**—After a ball warp has been bleached, dried or sized, the half bale are laid amongst the teeth of a coarse comb to 300 for each section, then they are arranged in a single beam, and in condition they are coiled upon a loom beam.

**Beam warping** is the system most extensively used in the cotton trade. The creels for these machines have an average capacity of about 600 bobbins, and are often V-shaped in plan. In each leg of the V, the bobbins are arranged in tiers of 16 to 20, and row behind row. The threads are drawn separately between the dents of an adjacent comb, passing over a number of rollers, and as they are dropped amongst the teeth of an adjustable comb and led down to a warp, which rises upon the surface of a drum. As the drum rotates the threads are drawn from the bobbins and wound upon a working bed, on which the entire warping mechanism is attached for arresting motion on the fracture of a thread, and also for accurately measuring and counting the lengths of warp; and the latter is of greater length than are needed for any warp, but they are insufficient in number. Thus, if 500 threads are in use, and warps of the above-named particulars are required, four similar beams must be filled (2000 + 200 = 10). When a warp is complete, the threads are passed through the loom, and it is coiled into a ball, assumedly by being immersed in a bath of water; and here, and in the case of the warp, the moisture is taken up by the yarn, which contain a small quantity of water, sufficient to submerge the rollers. This process does not lay all the lose fibres, but the threads remain elastic. After sizing, the warps are passed backwards and forwards, and over and under, a set of steam-heated cylinders by which the moisture contained in the threads is evaporated; they are next either robbed, or wound upon a loom beam.

**Slasher sizing.**—For sizing cotton yarn Radcliffe's dressing machine is used. This machine has to a large extent been discarded with effect to some branches of the textile industry it is still retained under various modifications. In a slasher the threads from a number of warping beams are divided into a set of fine threads which pass through steam pipes; and next squeezed between two pairs of rollers mounted in the trough. The undersize of the sizing rollers are in the size, but all the water is squeezed out and the desired amount of water is applied, by gravity upon the lower ones. On leaving the size trough the sheet of yarn almost encircles two steam-heated cylinders whose diameters are respectively about 6 ft. and 4 ft.; these quickly expel moisture from the yarn, but so much heat is generated that fans have to be employed to throw cool air amongst the threads. The yarn is next measured, passed above and below rods which separate threads that have been lastened together by size, smeared with piece marks, and coiled upon a loom beam by means of a slipping sliding gear. The last-named is employed so that the speed of winding shall not be affected by the increasing diameter of the yarn beam, for which reasons special gearing has been adopted. The pitch of the gearing, and the number of the moving parts, much necessary labour may be performed without actually stopping the machine; this relieves the yarn from strain, and gives better sizing, yet slashed warps are less elastic than dried, or ballled sizes, and they lack the smoothness of dressed warps.

**Hank sizing** is chiefly, but not exclusively, employed for bleached and coloured yarns. Machines for doing this work consist of a take wheel of some size, and a number of wormed or helical hooks. One hook is made to rotate a definite number of times in one direction, then an equal number the reverse way; the other has a weight suspended from its own hook, which is suspended in a series of pendulums. The pendulums are arranged so that all the sections of the pendulums are moved; and which are then removed. Most of the parts of the machine are operated by steam, and the size of the yarn is regulated by adjusting the number of the hooks, which is regulated by adjusting the number of steam pipes, and " doles" of hanks are suspended from the rollers with about one-third their length immersed in size. As the hanks rotate all parts of them enter the size applicator, which is arranged above the disks, removed from the rollers to the hooks where they are twisted to wring out excess, and force in required size. If sufficient size has not been added by one treatment, when unwound, the unwrapped hanks are passed to a similar machine containing past of greater density than the first there to be again treated; if necessary this may
be followed by a third passage. On the completion of sizing the hanks are removed either to a drying stove or a drying machine. If to the former, they are suspended from fixed, horizontal poles in a specially heated and ventilated chamber. If to the latter, loose poles are used, where the hanks are dropped, and slowly carried through a large, heated and ventilated box, being partially rotated while in the box. On reaching the front of the box they are supported on special frames, and the hanks are made over a warp, that is, wound and transferred to a loom beam.

Drawing-in, or entering, is the operation of passing warp threads through the eyes of a shedding harness, in a sequence determined by the by-warp, which had to be arranged in such a manner as to ensure the shedding of the warp through the several parts. It is effected by passing a hook through each harness eye in succession, and each time a thread is placed in the hook by an attendant, it is drawn in by the withdrawal of the handle.

Twisting or looming consists in twisting, between the finger and thumb, the ends of a new warp separately upon those of an old one, and, after a number of sets, or parts thereof, the warp is laid on the reed. The twisted portions adhere sufficiently to permit of all being drawn through the eyes simultaneously.

The Power Loom.—Little is known of the attempts made before the beginning of the 17th century to control all parts of a loom from one centre, but it is certain the practical outcome was inconsiderable. In the year 1661, a loom was set up in Danzig, for which a claim was made that it could weave four or six sets at a time without human aid, and he worked night and day; this was probably a ribbon loom. In order to prevent such a machine from injuring the poor people, the authorities in Poland suppressed it, and privately strangled or destroyed it. The Frenchman, M. de Gennes, a French naval officer, in 1678 invented a machine whose chief features consisted in controlling the healds by cams, the batten bycams and springs and the shuttle by a carrier. From 1748 to 1755 little of importance appears to have been done in France for the mechanical weaving of broadcloth. But in the last-named year M. Vaucanson constructed a very ingenious, self-acting loom, on which the fore-runner of the Jacquard machine was mounted as the carrier. All early attempts to employ mechanical motive power for weaving failed, largely because inventors did not realize that the success could only be reached through revolution. Mechanical preparing and spinning machinery had first to be invented, before steam was needed for motive power, and the industry required reorganization, which included the abolition of home labour and the introduction of the factory system.

During the last quarter of the 18th century it was generally believed on the authority of Arkwright’s patents, that many spinning mills would be erected as to render it impossible to consume at home the yarns thus produced, and to export them would destroy the weaving industry. Many manufacturers also maintained it to be impossible to devise machinery which would bring the production of cloth up to that of yarn. It was as a protest against the last-named assertions that Dr. Edmund Cartwright, a clergyman of the church of England, turned his attention to the mechanical weaving of cloth. He was fortunate than his predecessors, he attacked the problem after much initial work had been done, especially that relating to mechanical spinning and the preparation of the yarn, but we do not pretend to chronicle.

In 1785 Dr. Cartwright patented his first power loom, but it proved to be valueless. In the following year, however, he patented another loom which has served as the model for later inventions. He was conscious that for a mechanically driven loom to become a commercial success, either one person would have to attend several machines, or each machine must have a greater productive capacity than one manually controlled. The thought and ingenuity bestowed by Dr. Cartwright upon the realization of his idea were remarkable. He added parts which no loom, whether worked manually or mechanically, had previously been provided with, namely, a positive let-off motion, warp and weft motions, and sizing the warp while the loom was in action. With this machine he commenced, at Doncaster, to manufacture fabrics, and by so doing discovered many of its shortcomings, and these he attempted to improve by introducing and replacing the wheels that actuated the batten differentially; by improving the picking mechanism; by a device for stopping the loom when a shuttle failed to enter a shuttle box; by preventing a shuttle from being driven in the wrong direction; and by cutting the cloth with temples that acted automatically. In 1792 Dr. Cartwright obtained his last patent for weaving machinery: this provided the loom with multiple shuttle boxes for weaving checks and cross stripes. But all his efforts were unavailing; it became apparent that no mechanism, however perfect, could succeed so long as warp continued to be sized while a loom was stationary. His plans for sizing them while a loom was in operation, and of having a warp box in which they could be being when in a box; and by withdrawing the warps before the loom was stopped.

Still, provided continuity of action could be attained, the position of the power loom was assured, and means for the attainment of this end was provided, by Wilkins, in 1805, and by Thomas Johnson, by their inventions of the beam warper, and the dressing sizing machine.

For upwards of thirty years the power loom was worked under numerous mechanical arrangements, and many bad been acquainted, organization, and the preparatory processes. Textile workers were unused to automatic machinery, and many who had been accustomed to labour in their own homes refused employment in mills, owing to dislike of the factory system and the long hours of toil which it entailed, that spinners and manufacturers were compelled to procure assistants from workhouses; this rendered mill life more distasteful than it otherwise would have been to hand spinners and weavers. Yet improvements in every branch of the textile industry followed each other in quick succession, and the loom slowly assumed its present shape. By using iron instead of wood in its construction, and the battens, or slay, being instead of above the warp line, the power loom became more compact than the hand-loom.

Motion is communicated to all the working parts from a main shaft A (fig. 28), upon which two cranks are bent to cause the shaft B to oscillate; by toothed wheels this shaft, drives a second shaft, C, at half its own speed. For plain weaving four tappets are fixed upon the second shaft, two, D, for moving the shuttle to and fro, and two, E, for shedding the warp, the shed being similarly divided into four parts by a system of levers, F, G, H, and I, for moving them. For pattern weaving, numerous, are either loosely mounted upon the second shaft, or fixed upon a separate one. In either event they are driven by additional gearing, for the revolutions of the tappets to those of the crank shaft must be as one to the number of picks in the repeat of the pattern to be woven. Also, when two or more shuttles are driven successively from the same side of a loom, if the picking tappets rotate with the second shaft, those tappets must be free to slide axially in order to keep one out of action so long as the other is required to act. The warp beam F is often put under the control of chains instead of ropes, as used in hand looms, and the chains are attached to adjustable weighted levers, G, whereby the effectiveness of the weights may be varied at pleasure. In the manufacture of heavy fabrics, however, it may be necessary to deliver the warp by positive gearing, which is either connected, or otherwise, to the taking-up motion. The cloth is drawn forward regularly as it is manufactured by passing it over the rough surface of a roller, I, and imparting to the roller an intermittent motion each time a pick of weft is beaten home. This motion is derived from the oscillating slay, and is communicated through a train of wheels. The loom is stopped when the weft falls by a fork-and-grid stop motion, which depends for its action the lightly balanced prongs of a fork, N. These prongs come in contact with the weft, between the selvage of the web and the shuttle box each time the shuttle is shot to the side at which the apparatus is fixed. If the prongs meet no threads they are not depressed, and being unmoored a connexion is formed with a vibrating lever, J; the latter draws the fork forward, and with it a second lever G, by which the loom is stopped. On the other hand, if the prongs are tilted, the loom continues in action. If more than one shuttle is used it may be necessary to feel for each, instead of alternate threads of weft. In such cases a fork is placed beneath the centre of the cloth and lifted above a moving shuttle: if in future it meets with weft it is arrested, and the loom continues in motion, but if the weft is absent the prongs fall far enough beneath the
shuttle race for a stop to act upon a lever and bring the loom to a stand. To prevent a complete wreck of the warp it is essential to arrest the loom when a shuttle fails to reach its appointed box. For this purpose there are two devices, which are known respectively as the "tack winder" and the "tack." In England in 1819/20 the device was invented by Robert Miller, and its action depends upon the shuttle as it enters a box, raising two blades, K, which if left down would strike against stops, and so prevent the movement of the loom. In 1829 W. H. Hornby and William Kenworthy; it is an appliance for liberating the lower part of a reed when a shuttle remains in the warp, thus relieving it, for the time being, of its function in the weaving process. For this purpose the reed is divided into two sections and a bar is placed near the selvages of a web which is prevented from contracting sideways by being drawn tightly over the points.

Looking up to the eight to upwards of forty tapes kinds of warp, but as a rule those figured with small patterns are provided with heads for shedding as at L, while those with large patterns are provided with the Jacquard and its harness. Heads may be operated either by tappets or bobbins, but the range of usefulness in tappets is generally reached with twelve shafts of healds and with patterns having sixteen picks to a repeat; where they are unsuitable for heald shedding a dobby is used. A dobby may resemble, in construction, one of those figured for气体, except for the arrangement that rise and fall for any pick is made by cards. In other types of dobby's the selection is frequently made by lags, into which pegs and hooks are introduced and by which the shed is obtained. By acting upon levers the pegs bring corresponding hooks into contact with oscillating griffe bars, and these lift the required healds. Such machines are made single and double acting, and some have recently been designed in which the healds instead of being a separate selection, are required for power looms one of two types is selected, namely, drop or rotating boxes; the former are applicable to either light or heavy looms, but the latter are chiefly confined to light looms. As previously stated, Robert Kay invented drop boxes in 1767, but they were not successfully applied to the power loom until 1845, when Squire Diggle patented a simple device for operating them. In its first form it was found that the pins by which the shed is introduced, the most successful of these being operated indirectly from the shedding motion. Revolving boxes were patented in 1843 by Lake Smith. They consist in mounting a series of shuttles in cylinders, in which they are self- lubricated and can be moved in the cylinder far enough, in each direction, to bring the required shuttle in line with the picker.

Automatic Weft Supply.—Many devices have been added to power looms with a view to reduce stoppages, amongst whose for the automatic supply of weft are probably the most important. These efforts originated with Charles Parker, who, in 1850, obtained the patent for a system very similar in construction to that of William H. Northrop, which was patented in 1854. The machine is a simple affair, when J. H. Northrop patented a cop changer. By his plan a cylindrical hopper, placed over one shuttle box, is charged with cops or pirns. At the instant fresh weft becomes necessary the loom is stopped and the lower part of the ground beam is raised above the level of the shed, the spent one is pressed out of the shed, and the new weft is lifted into the shuttle eye, while the loom is moving at its normal speed. The motion of the shuttle is occasioned by a stop, or by a feeder which acts only when a predeterminate quantity of weft has been consumed. Many inventions are designed to effect an empty shuttle and introduce a full one; others change a cop, but differ in construction and action from the Northrop, yet, at the time of writing, they have not been so successful as the last-named. By relieving a Weaver of the labour of withdrawing, filling, threading and inserting shuttles it was seen that a large increase might be made in the number of looms and loom work. The system was adopted on a large scale when the Northrop was patented.

Warp Stopping Motions date from 1786, when Dr. Cartwright suggested it as one of the improvements in his loom. A fracture occurred, at which time a detector fell into the path of a vibrator and the loom was arrested. The demand for warp stop motions was, however, small until automatic weft supply mechanisms were adopted. The majority of these devices now in use are constructed upon Dr. Cartwright's lines, but some are so attached to weft heads that, at one position in every shed, an unbroken thread causes both warps and the detector until a thread fails, when a detector is engaged by a vibration of a ratchet and self-located. In other warp stop motions pairs of threads are crossed between the reed and rod, and a wire passed between them is held by the wire to return the shed. In each of the warp reed there is a spring back, makes contact with a metal bar, and electro-mechanical connections stop the loom.

Smallwares. — A loom, which was for a long period operated manually, was brought into use more than a century before Dr. Cartwright's invention. It was known as the Dutch engine loom, and was designed to weave from a reed built in one frame, each having a complete set of parts, and as the first practical effort to connect and control all the motions of weaving from one centre. The place and date of its invention are uncertain; but it is known that in some districts its use was entirely prohibited, in others it was strictly limited, and that it was worked in Holland and the eastern parts of England about the middle of the eighteenth century by John and John Snell, in 1745, for additions which enabled it to be worked by hand, by water, or other force, and in 1760 John Snell appears to have invented the device by which the reed can be raised by means of a horizontal bar that set in motion all parts of the machine. The shuttles and reeds are actuated from the batten, the former originally by pegs, but later by a rack and pinion arrangement, which in action is of the type of the familiar eighteenth-century loom as the eye, of each, was sharpened. It was the only type of loom to which the由中国 word "MACHINERY" could be applied, as the only machine looms are those in which the picking parts are moved by means of motions of the loom which are independent of the active part.

In Double Pick Looms the special features are those that control the pick threads, and those that sever the vertical lines of pile. Two ground warps are requisite, and unless they are kept a uniform length the pick threads cannot be reasonably well worked. The lower warp, or pick threads are also made to differ from each other to suit the type of fabric to be manufactured, as, for example, double and single, plain or figured, and their textures.

The lower warp, or pick threads are also made to differ from each other to suit the type of fabric to be manufactured, as, for example, double and single, plain or figured, and their textures.

In Double Pick Looms the special features are those that control the pick threads, and those that sever the vertical lines of pile. Two ground warps are requisite, and unless they are kept a uniform length the pick threads cannot be reasonably well worked. The lower warp, or pick threads are also made to differ from each other to suit the type of fabric to be manufactured, as, for example, double and single, plain or figured, and their textures.
series that separate one line of loops from another. At such times the weft is not beaten home, but a broad crack is formed. So soon as the reed again moves through its normal space three picks of weft "are simultaneously driven home, thus closing the gap, and causing part of the pile to loop upward, the remaining downward. The system is available for plain and figured effects.

_Gauze Textures_ are woven in looms having a modified shedding harness, which, at predetermined intervals, draws certain warp threads crosswise beneath others, and lifts them while crossed. Also, a tensioning device to slacken the crossed threads and thus prevent breakages due to excessive strain. At other times the shedding is normal.

_Lappet Looms_ have a series of needles fixed upright in laths, and placed in a groove cut in the slay, in front of the reed. Each needle carries a thread which does not pass through the reed, hence, by giving the laths an endless movement of varying extent, and lifting the needles for each pick, their threads are laid crosswise in the web to pattern.

**ARCHAEOLOGY AND ART**

The archaeology of shuttle-weaving shows that for ages the use of a loom for weaving plain, as distinct from ornamental or figured textiles, whether of fibres or of spun threads, has been practically universal, whilst the essential points of its construction have been almost uniform in character. An early stage in its development, anterior probably to that when the spinning of threads had been invented, is represented by the loom or frame (see fig. 29) used by a native of Sarawak to make a textile with shreds of grass. As will be seen, the shreds of grass for the warp are divided into groups by a flat sword-shaped implement which serves as the batten (Latin _spatha_). The shuttle is passed above it, leaving a weft of grass in between the warp; the batten is then moved upwards and compresses the weft into the warp; this method of pressing the wefts upwards was usually employed by Egyptian and Greek weavers for their linen textiles of beautiful quality. Fig. 30 gives us an Indian

**Fig. 29.**—Loom from Sarawak.

**Fig. 30.**—Indian Hill Tribesman's Loom.

Hill tribesman weaving with spun threads; but here we find the loom fitted with rudely constructed headdresses, by which the weaver lifts and lowers alternate ranks of warp threads so that he may throw his shuttle-carried weft across and between them. Besides the headdresses there is a hanging reed or comb, and between the reeds of it the warp threads are passed and fastened to a roller or cylinder. After throwing his shuttle once or twice backwards and forwards, the weaver pulls the comb towards himself, thereby pressing his weft and warp together, thus making the textile which he gradually winds from time to time on to the roller. This advance in the construction of the loom is also virtually of undatable age; and except for more substantial construction, there is little difference in main principles between it and the medieval loom of fig. 31. With such looms, and by arranging coloured warp threads in a given order and then weaving into them coloured shuttle or weft threads, simple textiles with stripes and chequer patterns could be, and were, produced; but textiles of complex patterns and textures necessitated the more complicated apparatus that belongs to a later stage in the evolution of the loom. Fig. 32 is from a Chinese drawing, illustrating the description given in a Chinese book published in 1210 on the art of weaving intricate designs. The traditions and records of such figured weavings are far older than the date of this book. As spun silken threads were brought into use, so the development of looms with increasing numbers of headings and other mechanical facilities for this sort of weaving seems to have started. But as far back as 2690 B.C., the Chinese were the only cultivators of silk, the delicacy and fineness of which must have postulated possibilities in weaving far beyond those of looms in which grasses, wools and flax were used. It therefore is probably correct to credit the Chinese with being the earlier inventors of looms for weaving figured silks, which in course of time other nations (acquainted only with wool and flax textiles) saw with wonder. At the comparatively modern period of 300 B.C. Chinese dexterity in fine-figured weaving had become matured and was apparently in advance of any other elsewhere. Designs were being woven by the Chinese of the earlier Han Dynasty 206 B.C. as elaborate almost

as of those of the present day, with dragons, phoenixes, mystical bird forms, flowers and fruits. At that time even Egypt, Assyria or Babylonia, Greece and Rome, seem to have been only learning of the fact that there was such a material as silk. Their shuttle-weaving had been and was then concerned with spun wool and flax and possibly some cotton, whilst the ornamentation of their textiles, although sparkling on occasion with golden threads, was done apparently not by shuttle-weaving but by embroidery, a sort of comparable weaving and weaving from which tapestry weaving descended (see Tapestry). The range of their colours was limited, reds, purples and yellows being the chief; and their shuttle-weaving was principally concerned with plain stuffs, and in a much smaller degree with striped, spotted and chequered fabrics. Remains of these, whether made by Egyptians thousands of years B.C., by Scandinavians of the early Bronze Age, by lake dwellers, by Aztecs or Peruvians long before the Spanish Conquest, display little if any technical difference when compared with those woven by nomads in Asia, hill tribes in India and natives in Central Africa and islands of the Pacific. Such ornamental effect as is seen in them depends upon the repetition of stripes or very simple crossing forms, still this principle of repetition is a prominent factor in more intricate designs which are shuttle-woven in broad looms and lengths of stuff.

The world's apparent indebtedness to the Chinese for knowledge of figured shuttle-weaving leads to some consideration of their early overland commerce westwards. About 200 B.C. during the Han Dynasty, these traders had extended beyond inner Asia to the confines of the Graeco-Parthian empire, then at its zenith, and the protection of the route by which the Seres (Chinese) sent their merchandise to Parthia (of great importance) some 73 years later the emperor of China sent a certain Chang Kien on a mission to the Indo-Syrians; and according to his records the people as far west as Bactria (adjacent to the Graeco-Parthian territory) knew weaving, and amongst other things understood the preparation of silk. Chinese weavings had for some time been coming into Persia, and doubtless instigated the more skilled weavers there to adapt their shuttle looms in course of time to the weaving of stuffs with greater variety of effects than had been hitherto obtained by them; and into Persian designs were introduced details taken not only from Chinese textiles, but also from sculptured, embroidered and other ornament of Graeco-Parthian and earlier Babylonian styles. In A.D. 97 Chinese enterprise in still furthering their trade relations with the Far West is at least suggested by the fact that envoys from the emperor of China to Rome actually reached the eastern shores of the Mediterranean, but turned back frightened by the Parthian accounts of the terrors of the sea voyage.

Early in the 3rd century A.D. Heliogabalus is reputed to have been amongst the first of the Roman emperors to wear garments entirely of silk (holosericum), which, if figured (as is not unlikely), were probably of Syrian or Persian manufacture. Sidonius Apollinaris (5th c. A.D.) writes of Persian patterned stuffs, "of brilliant cushions and stuffs on which, produced by a miracle of art, we behold the fierce Parthian with his head turned back on a prancing steed; now escaping, now turning to hurl his spear, by turns fleeing from and putting to flight wild animals whom he pursues" — a description quite appropriate to such silk weaving as that in fig. 33.

A number of kindred pieces have been recovered of late years from Egyptian burial-places of the Roman period. The Persians of the Sassanian dynasty (3rd to 7th century) traded in silks with Romans and Byzantines; King Chosroes (about 570) encouraged the trade, and ornamental weaving seems to have been an industry of some stability in Bagdad and other towns north, east and south, e.g. Haramand, Kavzin Kashan, Yazd Persepolis, &c. To the north-west of Persia and north of Syria lay the Byzantine region of Anatolia (now Asia Minor), some towns in which became noted for their fine weaves, whilst the mass of the population there was well off in the 6th century, the country highly cultivated and prosperous, and justice fairly administered, thus affording favourable conditions for an industry reached at vice weaving, which had been and was prospering in neighbouring Syrian districts.

2 Aristotle describes the silk-worm and its cocoon. Virgil-Martial and late Roman writers (including Pliny) throw scarcely more light upon the use of silken stuffs than that they were of rarity and great expense by ordinary Roman). Sayings of (see Codex Theodosiius, lib. x. tit. 21, lex 1). In the 5th century the weaving of silk textiles and mantles was prohibited (Codex Theodosiius, lib. x. tit. 21, lex 3).
3 Between the 1st and 6th centuries A.D., then, knowledge of silk and its value in fine weaving was spreading itself, not only in the further western regions of southern Asia, but also in Egypt, where Greek and Roman taste influenced the works of Copti or those...
or Alexandria or other towns in Lower Egypt as well as in Syria. Contemporaneously the development of similar weaving appears to have been proceeding in Byzantine provinces, though perhaps not in so marked a way as when Justinian systematized sericulture and still further stimulated shuttle-weaving in the town of Byzantium (Constantinople) itself in A.D. 552.

For examples of the elaborate figure weavings at that time we have to rely upon such as have been rescued in the service of archaeology from the oblivion of tombs and burial-places. The dates of some specimens can be fixed with almost certainty by means of nearly contemporary records, e.g. those of Sidonius Apollinaris and later Anastasius the Librarian; comparison and classification lead to almost conclusive inferences as to the dates of other examples. Broadly speaking, the earlier of these remains (i.e. from about the 4th to the 7th century) seem to be either of Persian (Sassanian) manufacture and design, or of Syrian and possibly Alexandrian make. Christian subjects were occasionally introduced into the designs. Between the 7th and the 13th centuries Byzantine manufactures came to the fore, and it is difficult if not impossible now to draw a clear line between those of Roman-Byzantine, Perso-Byzantine and Moslem-Byzantine styles, though one may do so in respect of certain Moslem (Moorish and Saracenic) weavings, which have distinctive features of design, and were produced in the south of Spain and in Sicily about a period from the 10th century to the 13th.

Fig. 35.—Syrian or Anatolian Silk Weaving of the 5th Century, with Samson and the Lion (repeated).

Fig. 36.—Byzantine Red Silk and Gold Thread Weaving of the 11th Century. Pairs of lions and pairs of small birds.

Fig. 37.—Part of Silk Wrapping of the Emperor Charlemagne, possibly of Bagdad manufacture, 9th Century, with Fanciful Elephant and Sacred Tree device in a Roundel.

Fig. 38.—Fragment of Byzantine Silk, 12th Century, with Ogival Framing about pairs of Birds, &c.

Anatolian: of the same date are pieces with scenes of the Annunciation repeated in roundels, and with artistic birds and lions, in the treasury of the Sancta Sanctorum of the Chapel of St Lawrence in
the old Lateran Palace, Rome. Scriptural subjects seem to be typical of those which were condemned by Anatolian and Syrian fathers of the Christian church as early as in the late 4th century, and Astérix, bishop of Amasus, in denouncing the luxury of the rich in flaunting themselves in such inappropriately decorated silks, has left a most useful description of the subjects decorating them. A scheme long maintained in Syrian and Byzantine patterns was that of repeated roundels, within which other than scriptural subjects were woven, e.g., hunters on horseback (as in Fig. 33), fantastic animals and birds, singly or in pairs, confronting one another or back to back, frequently with a sacred tree device between them. A piece of Sassanian silk, probably of the 6th century, shows a griffon practically identical with that sculptured on the patterned saddlecloth of a horse (Chosroes I.) in the archway to the garden of the king’s palace at Kermchah.

Less common perhaps are patterns, without roundel or other framing, composed of animals, birds and the like, formally treated and repeated vertically and horizontally, as in Fig. 36, which is from a silk and gold thread shuttle-weaving classified as Byzantine of the 11th century manufacture. But this style of composition also occurs in a Sassanian or Syrian work, and again in the Cope of St Maxim at Chinon, which is powdered with panthers. Conventional eagles (reminiscent perhaps of the Roman Eagle), with scale patterns on their wings, in the wrappings reputed to have been given by the Empress Placidia for the corpse of St German (448) preserved at the church of St Eugènus at Auxerre. Some likenesses in style may be detected between these latter and a fragment of one of the wrappings of St Cuthbert (d. 688) at Durham, though in this case the elaborate ornamentation is set within a roundel. Prior to the discovery of woven silks in the Alkmn cemeteries, the periods to which the style in association and association had ascribed the Auxerre and Durham specimens were considered too early; but there now seems to be far less reason to question that ascription. Fig. 37 is from part of a silk wrapping of Charlemagne (early 9th century) now at Aix-la-Chapelle. It bears a Greek inscription of the names of Peter, governor of Nogroppo, and Michael, chamberlain of the Imperial Chambers, and this is taken by some authorities as evidence that the weaving was made at Byzantium. On the other hand, Egíndard, Charlemagne’s secretary, has written of gifts, including rich textiles presented in his day by Haroun al Raschid to the emperor, and a fabric like that in question might have been made quite possibly even at Bagdad in the 9th century or earlier. In the 11th century amongst the handkerchief streets in the city of Byzantium were many skilled native and foreign weavers; and their designs generally appear to reflect the style of earlier Persianesque and Syrian taste.

About the 12th century the well-used pattern scheme of roundels became more or less superseded by one of continuous ovals, of ogival framings (see Fig. 38), contemporary with which are narrow and wide bands based on hexagonal and star-shape frames. Within these new varieties of pattern framings recur the Byzantine and Persianesque pairs of birds, animals, &c. But distinct from these is the more restricted style which has been more frequently observed and arises perhaps because of the influence of the Fatimy Khalifs, not only in Syria and Alexandria but also in Sicily and southern Spain. Patterns of this Moslem or Saracenic type are usually composed of a succession of parallel bands—narrow and wide—containing Kufic inscriptions, groups of simple intricate geometrical devices, and occasionally conventional animals and birds. A 13th-century example of this class of pattern has been given elsewhere (see Brocade, Fig. 1).

Almeria, Malaga, Grenada and Seville were notable Moorish weaving places in Spain for such patterned silks and stuffs as these; and even after the Christian conquest of Granada at the end of the 13th century this city retained its celebrity for silks woven "à la Mosquée." In Sicily no similar survival of Saracenic influence seems to have been as strongly maintained, notwithstanding the numerous Saracen weavers at work in the island almost a century and a half years before such silk weaving came to be organized at Palermo under Norman supremacy. According to the usual story, Roger of Sicily, or Roger Guiscard, who in 1117 made a successful raid on the shores of Attica, took Athens, Thessalonica, and a number of Greek (Byzantine) weavers and settled them at Palermo in the factory known as the Hôtel des Tiraz. A mixture of Byzantine

WEAVING

and Saracenic styles of textile patterns ensued, and this peculiarity is demonstrated in many of the rich fabrics attributed to south and north Italian weavers from the 12th century onwards. From Palermo

portant part, and possibly was applicable to early brocades. *Carmines* or *Carmakh* (Arab *Kambis*, from the Chinese *Kimtsa*, also brocade) was another handsome stuff corresponding in a way with Indian

 Apparel of a Dalmatic woven in Venice late in the 15th century, with the Virgin in glory.

 the art of ornamental weaving in this style soon extended into the mainland, and from Apulia a bishop of St Evroul in Normandy is mentioned as having obtained a number of silk goods in the 12th century. From the 13th century onwards Lucca, Florence, Milan, Genoa, and Venice became important centres, using not only imported silk, but also such as was then cultivated in Italy, for sericulture had become an Italian industry early in the 13th century. Wandering Saracenic and Byzantine weavers even before that time had strayed or been taken to work at places in Germany, France and Britain, but the output of their productions in northern countries was almost infinitesimal as compared with that of the Far greater Italian output, nevertheless they were sowing the seeds of a harvest to be reaped centuries later by these more northerly European countries.

To the influence of these early sporadic weavings we seem to trace a distinctive class of work, which was done by inmates of monasteries and convents as well as by devout ladies, in little looms, for use as stoles, mantles, orphreys and similar narrow bands. A rhyming chronicler of the 13th century paraphrases the older record by Eginhard of the skill of Charlemagne's daughters in silk weaving, "omer en sole en taillieles" or small looms. The illustrations in fig. 39 give varieties of this class of work between the 7th and 15th centuries, for which Cologne especially seems to have become famous in the 15th century. Venice also made work of corresponding character; and the designs were evidently furnished by or directly adapted from the compositions of such artists as those who produced the notable German and Venetian woodcuts of the 15th century (fig. 40).

Whilst the bulk of the Italian patterned stuffs issuing in great lengths from large looms were of silk, a good many also were woven in wool, or wools intermixed with silk. The designs of the silk textiles—Persian, Syrian, and Byzantine—were of the most varied character: some seem to relate to such materials as sарaцent or taffetas; later in development are satins, damask, brocades, and still later (i.e. about the end of the 14th century) come Italian velvets and cloths of gold, which quite transcended the ancient and less substantial attaцal cloths of the early Roman period. Medieval inventories and records contain many names of textiles, but the exact technical meaning of several of them is uncertain. "Saracden, Saracdn, Saracen" seem to relate to such materials as sаrаcеnt or таffeta: *zetani*, from low Latin, is held by some writers to be of the same class as *samit* or *exammate*, so called because the wattles were only caught at every sixth thread of the warp; *damask*, now regarded as a special class of textile, the ornamentation of which depends upon contrasting sheets in the surface of the stuff, whether of silk or linen, got its name from Damascus, much in the same way as *Baudack* comes from Baдdak, or Bagdad. *Baudack*, and an apparently somewhat earlier word *ciclatoun*, seem to have been general terms for rich-looking textiles, in which gold thread played an im-

*Sammet* implies velvet, as does the Russian *Axemilt*. Diaper (Italian *diaspro*, meaning patterned) was used not only to denote a regular and geometric pattern but in some cases a special sort of linen or silk. *Muslin* from *Mosul*, and *gauze* from *Gaza*, are two
well-known and kindred textiles. Frequently one meets with odd phrases such as "silk of Bryges" (Bruges), "silk dornex" (from Dornes), "sheets of raynes" (Rheims), and "fusian in Appinies" (Naples fustian).

Many of the foregoing stuffs are identifiable by textures peculiar to them; this is, however, not so as regards their ornamental patterns, for these are frequently interchanged, the same class of patterns appearing in satin damasks, velvets and brocades. This is particularly the case with 13th- and 14th-century Italian stuffs. In the patterns of these, as previously suggested, are strong traces of Saracen and Byzantine motives, intermingled with ladies, heraldic devices, human figures, eagles, falcons, hounds, lions, harts, boards, leopards, rays of light, Persian-Moresque pine cone and cloud forms, and even Chinese mystical birds, symmetrically distributed, without framing, as a rule, though elaborations of the ovial frame or scheme are also met with, but less frequently (see fig. 41). Such fabrics, made in the main by Lucchese weavers, appear to have been traded in with other European countries. But besides trade records, there are others relating to Lucchese weavers who left their own town under stress of circumstances, civil wars and the like, to settle and work elsewhere, as in France and Flanders, during the 15th century. Nevertheless the northern parts of Italy were the fertile places for producing fine types of patterned textiles used by Italian and other

carnations and hyacinths depicted on a smaller scale are unmistakably Ottoman. Persian fabrics of rather thin silk material or tapestry, next to that of Oriental, were also being woven with varieties of floral designs, as well as others portraying Persian stories. At this period there was considerable activity in weaving sumptuous stuffs at Broussa and Constantinople (fig. 44). Arabic and Persian weavers of the type came over to be employed in Venice, blending Italian and Oriental characteristics into their designs.

In Spain during the early 16th century we have traces of Hispano-Moresque influence in the overlapping and interlocking nondescript forms, but Spanish weavings are hardly comparable in quality with the Italian of the same time. In the middle of this century cloths of gold or of silver, with the pattern details raised in velvet and brocades of similar form. Various formal design were made in greater quantities in Italy for costumes of men and women. The frequent basis of most of the designs is the ovial framework already referred to, but it is much elaborated with detail and combined with the in the case of portions of the grounds. The ornamentation of this style is purely conventional throughout, the various devices having very little of the appearance of actual objects like fruit, leaves, etc.

The time, however, was close at hand when a more general reaction was to set in, in the direction of designs representing forms very nearly as they actually look, an example which occurs in fig. 45, with its leaf forms and crowns. This from a class of silk damask or lampas, which is kindred to brocadel; a feature in last is that the ground is different in colour from that of the ornament on it, and as in the case of portions of brocades its texture is of tafetta or sarsenet quality. At the end of the 16th century a peculiar type of pattern consists of repetitions in different positions of the same detail treated realistically or purely ornamentally, little if anything of quite the same character having been previously designed. Of such fig. 46, with its rather realistic leaf legs variously placed, is an example. The principle in the composition of these patterns, but with a greater variety of conventional detail, is followed in French 17th century examples. However, as soon as figured weaving became well organized in France at this time, a school of designers arose and it is a country who adopted a realism that predominated in French patterns during the succeeding 150 years, that is, from Louis XIV, to the end of the 18th century. Throughout this period French figured stuffs seem to surpass those of other countries. But it was M. Alphonse Pariset, any account is to be taken of the weavers during the 14th and 15th centuries who made cloths and velvets of silk at Paris, Rouen, Lyons, Nimes and Avignon, and whose remembrance is that they were almost solely Italian emigrants from Lucca and Florence, who had fled their towns during troublous times. By a charter granted by Francis I. to Lyons, foreign and native workmen were encouraged to promote the city's interests in trade and manufacture; still, it is not until the 17th century that Lyons really asserts herself in producing fabrics possessing French taste and ornamentation. The more important designs were supplied by trained artists of whom Revai, a pupil of Le Brun, the first principal pupil of Fillement and Philippe de la Salle in the 18th century, may be

See Ornament in European Silks (London, 1899), p. 15.

ARCHAEOLOGY AND ART | WEAVING 453

European courts and nobles; and if the art seriously dwindled in the town of Lucca, it flourished conspicuously, from the end of the 14th century and up to the beginning of the 16th century, in Venice, Bohemia, Bologna, Florence and Lucca, and this was nothing, it seems, to compete with it in France, Germany or England. The identification of its splendid varieties is made possible upon referring to contemporary paintings by Orcagna, Crivelli, Spinello Aretino and later Italian masters, as well as to those of the Flemish School, Gherard David, Masque, &c.

Of a specially distinct class, very dignified in effect, are patterns of the 15th century based upon the repetition of conventional potted-leaf, patterned, arranged in outline, each encircling a pomegranate or cone form around which radiate small leaves or blossoms; though they were more richly developed in superb velvets and cloths of gold, for Florence, Venice and Genoa were famed, this type of design is also woven in less costly materials. A composite unusual and beautiful design of another kind is given in fig. 42. Repeated large leaf shapes can just be detected in it, but more remarkable are the bunches of radiating tails of wheat ears and cornflowers within them; whilst about them, arranged in hexagonal trellis, are leafy bars, small birds, crowns, pomegranates and other daintily depicted plant forms. This piece of the patterned with brocade weaving is of late 15th century manufacture: and after the opening of the next century the freedom towards realistic treatment, which we find here, enters into many of the Italian patterns. In some of them, however, an Ottoman or Anatolian feeling is apparent, as in fig. 43 from a figured silk which is considered to have been made in Venice. The chained dogs and birds in this design recall the rather more formal ones in Lucchese pattern of a hundred and fifty years was nothing new. The lengthy serrated leaves and elongated flower devices charged with

FIG. 43.—Piece of Venetian Silk Weaving showing Ottoman influence in the design (16th century).
named. Their influence in the domain of fanciful, and at times extravagant realistic, floral patterns was widespread. Soon after the revocation of the Edict of Nantes, in consequence of which thousands of Protestant weavers left France, factories for weaving silks and mixed materials with patterns imitating the successive French phases became organized at Spitalfields, in Cheshire, Yorkshire, Norfolk and elsewhere in England, as well as in Germany at Crefeld, Elberfeld, Barmen and Wesen.

Entirely distinct from what has already been discussed is a branch of artistic weaving concerned with the decoration of linens, that flourished notably in Italy towards the end of the 15th century and in the 16th century. From early times long and narrow Italian tablecloths were enriched with ornament of linen or cotton threads of a single colour, and Signora Isabella Erera has written at some length about them, illustrating the result of her investigations with several examples culled from paintings by Pietro Lorenzetto of Siena. In Leonardo da Vinci's painting of the Last Supper, now in the Louvre, the border of the tablecloth is very like many examples of this sort of textile in the Victoria and Albert Museum, South Kensington. Their characteristic artistic ornament, in rather heavy blue thread, consists of quaint animals and birds in pairs, which are evident derivations of those so often seen in Italo-Byzantine and Lucchese silks and brocades. Be-

not reversed, as in the case with earlier pieces. A large collection of this German damask weaving, with colored thread was formed under the auspices of the Royal Kunstgewerbe Museum at Dresden.¹ The north-eastern Irish industry of damask weaving owes much to French Protestant refugees, who settled there and revived the handloom industry. In the 17th century, the Irish linen industry began to decline, and by the 18th century, it had been replaced by the English industry. However, the Irish linen industry was revived in the 19th century, and by the 20th century, it was once again a major producer of linen.

LITERATURE.—The following are titles of a few works on weaving, from which, whilst important information on the subject may be derived:

WEB (a word common to Teutonic languages, cf. Du. webbe, Dan. tøn, Ger. Gewebe, all from the Teutonic webb—to weave), that which is woven (see Weaving). The word is thus applied to anything resembling a web, as the web of the feather of a bird or the membrane which connects the toes of many aquatic birds and some aquatic mammals; it is particularly used for the "cobweb," the net spun by the spider, the Old English name for which was dror-coppe, i.e. poison-head (dor, poison, and coppe, tuft or head). In architecture the term "web" is sometimes given, in preference to "panel," to the stone shell of a vault resting on the ribs and taking its winding surface from the same; see VAULT.

WEBB, MATTHEW (1848–1883), English swimmer, generally known as "Captain Webb," was born on 6 June 1848, son of a doctor. While still a boy he was one of his brothers from drowning in the Severn, and, while serving on board the training ship in the Mersey, he again distinguished himself by saving a drowning comrade. He served his apprenticeship in the East India and China trade, shipped as second mate for several owners, and in 1874, was awarded the first Stanhope gold medal by the Royal Humane Society for an attempt to save a seaman who had fallen overboard from the Cunard steamship "Russia." In 1875 Captain Webb abandoned a sea-faring life and became a professional swimmer. On the 3rd of July, the swimmer from Blackheath Pier to Greenwich, a distance of 10 m., in 42 hours, a record which remained unbeaten until 1890. In the same year, for one unsuccessful attempt, he swam the English Channel, on the 24th of August, from Dover to Calais in 21 ½ hours. For many years Webb gave performances of diving and swimming at the Royal Aquarium in London and elsewhere. Crossing to America, he attempted, on the 24th of July 1883, to swim the rapids and whirlpool below Niagara Falls. In this attempt he lost his life.

WEBB, SIDNEY (1850–1904). English socialist and author, was born in London on the 13th of July 1850. He was educated at private schools in London and Switzerland and the Birkbeck Institute and the City of London College. From 1872 to 1878 he was employed in a city office, but he entered the civil service by open competition as a clerk in the War Office in 1878, became

¹ See Leinwandmuster des XVII. und XVIII. Jahrhunderts, Emil Kunsch (Dresden, 1891).

surveyor of taxes in 1879, and in 1881 entered the colonial office, where he remained until 1891. In 1885 he was called to the bar at Gray's Inn. Mr Webb was one of the early members of the Fabian Society, contributing to Fabian Essays (1880); and he became well-known as a socialist, both by his speeches and his writings. He entered the London County Council in 1892 as member for Deptford, and was returned at the head of the poll in the successive elections of 1895, 1896, 1901 and 1904. He resigned from the civil service in 1891 to give his whole time to the work of the Council (where he was chairman of the Technical Education Board) and to the study of economics. He served from 1903 to 1906 on the Royal Commission on Trade Union Law and on other important commissions. He married in 1892 Miss Beatrice Potter, herself a writer on economics, and in 1894 became a member of the Fabian Society; he was a contributor to The Scope of the Movement in Great Britain (1891) and a contributor to Charles Booth's Life and Labour of the People (1891–1903). His most important works are: a number of Fabian tracts; London Education (1904); The Eight Hours Day (1891), in conjunction with Harold Cox; and, with Mrs Sidney Webb, The History of Trade Unionism (1894, new ed. 1902), Industrial Democracy (1897, new ed. 1902), Problems of Modern Industry (1898), History of Liquor Licensing (1903), English Local Government (1906), &c. Mrs Webb was a member of the Royal Commission on Trade Union Law, and she and her husband were responsible for the Minority Report (see Poor Law) and for editing the widespread movement in its favour.

WEBB CITY, a city of Jasper county, Missouri, U.S.A., in the S.W. part of the state, about 160 m. S. of Kansas City. Pop. (1890) 5043; (1900) 9201, of whom 248 were foreign-born; (1910 U.S. census) 11,817. It is served by the Missouri Pacific and the St Louis & San Francisco railway systems, and is the headquarters of the electric interurban railway connecting with Carthage and Joplin, Missouri, Galena, Kansas and other cities. With Carterville (pop. 1910 4339) it forms a productive and populous "district" and is among the most productive and productive "districts" in the rich lead and zinc region of south-western Missouri, and Webb City owns its industrial importance primarily to the mining and shipping of those metals. The value of the factory product increased from $353,866 in 1900 to $637,695 in 1905. Webb City was laid out and incorporated as a town in 1875, and first chartered as a city in 1876. White lead was discovered here in 1873, on the farm of John C. Webb, in whose honour the city is named; and systematic mining began in 1875. William스 Williams (fl. 1878), English literary critic, was educated at St John's College, Cambridge, where he took his degree in 1572–1573. He was tutor to the two sons of Edward Sulyard of Flemings, Essex, and later to the children of Henry Grey of Pigo in the same county. A letter from him is prefixed to the 1592 edition of Tancred and Gismund,² written by his friend, Robert Willmot. In 1586 he published A Discourse of English Poetrie, dedicated to his patron, Edward Sulyard, Webbe argued that the death of good English poetry since Chaucer's day was not due to lack of poetic ability, or to the poverty of the language, but to the want of a proper system of poetry. He urban 'this tinkery verse which we call rhyme," as of barbarous origin, and comments on the works of his contemporaries, displaying enthusiasm for Spenser's Shepheard's Calendar, and admiration for Phaer's translation of Virgil. He urged the adoption of hexameters and sapphics for English verse, and gives some lamentable examples of his own composition.

The Discourse was reprinted in J. Haslewood's Ancient Critical Essays (1811–1813), by G. E. W. Brooks in 1869, and in Gregory Smith's English Poetical Essays (1904).

WEBER, CARL MARIA FRIEDRICH ERNEST VON (1786–1826), German composer, was born at Eutin, near Lübeck, on the 8th of December 1786, of a family that had long been devoted to art. His father, Baron Franz Anton von Weber, a military

² The original play, Gismonde of Salmone, was by five authors, and was produced in the Queen's presence at the Inner Temple in 1568.
WEBER, C. VON

officer in the service of the palgrave Karl Theodor, was an excellent violinist, and his mother once sang on the stage. His cousins, Josepha, Aloysia, Constanze and Sophie, daughters of Franz Anton's brother Fridolin, attained a high reputation as vocalists. The great composer, Mozart, after having been rejected by Aloysia, married Constanze, and thus became Franz Anton's nephew by marriage. Fridolin played the violin nearly as well as his brother; and the whole family displayed exceptional talent for music. Franz Anton von Weber was a man of thriftless habits and culpable eccentricity. Having been wounded at Rossbach, he quit the army, and in 1788 he was appointed financial councillor to Clement August, elector of Cologne, who for nine years overlooked his incorrigible neglect of duty. But the elector's successor dismissed him in 1798; and for many years after this he lived in idleness at Hildesheim, squandering the property of his wife, Anna de' Fumetti, and doing nothing for the support of his children until 1778, when he was appointed director of the opera at Lübeck. In 1778 the prince bishop of Eutin made him his kapellmeister, and not long afterwards his wife died of a broken heart. Five years later he went to Vienna, where he was appointed director of the music at the court. Haydn, and in 1785 married the young Viennese singer Genovefa von Brenner. In the following year Carl Maria von Weber was born—a delicate child, afflicted with congenital disease of the hip-joint.

On his return from Vienna, Franz Anton, finding that a new kapellmeister had been chosen in his place, accepted the humbler position of "Stadt Musikant." This, however, he soon relinquished; and for some years he wandered from town to town, giving dramatic performances, in conjunction with the children of his first wife, wherever he could collect an audience. The effects of this restless life upon the little Carl Maria's health and education were deplorable; but, as he accompanied his father everywhere, he became familiarized with the stage from his earliest infancy, and thus gained an amount of dramatic experience that laid the foundation of his future greatness. Franz Anton hoped to see him develop into an infant prodigy, like his cousin Mozart, whose marvellous career was then rapidly approaching its close. In furtherance of this scheme, the child was taught to sing and place his fingers upon the pianoforte almost as soon as he could speak, though he was unable to walk until he was later. He was notably advanced in his studies; and early his power of observation and aptitude for general learning were so precocious that he seems, in spite of all these disadvantages, to have instinctively educated himself as became a gentleman. In 1798 Michael Haydn taught him gratuitously at Salzburg. In the March of that year his mother died. In April the family visited Vienna, removing in the autumn to Munich. Here the child's first composition—a set of "Six Fughettas" —was "emblished, with a pompous dedication to his half-brother Edmund; and here also he took lessons in singing and in composition. Soon afterwards he began to play successfully in public, and his father compelled him to write incessantly. Among the compositions of this period were a mass and an opera—Die Macht der Liebe und des Weins—now destroyed. A set of "Variations for the Pianoforte," composed a little later, was lithographed by Carl Maria himself, under the guidance of Alois Senebelder, the inventor of the process, in which both the father and the child took great interest.

In 1800 the family removed to Freiberg, where the Ritter von Steinsberg gave Carl Maria the libretto of an opera called Das Waldmädchen, which the boy, though not yet fourteen years old, at once set to music, and produced in November at the Freiburg theatre. The performance was by no means successful, and the composer himself was accustomed to speak of the work as "a very immature production"; yet it was afterwards reproduced at Chemnitz, and even at Vienna.

Carl Maria returned with his father to Salzburg in 1801, resuming his studies under Michael Haydn. Here he composed his second opera, Peter Scholl und seine Nachbarn, which was unsuccessfully produced at Nuremberg in 1803. In that year he again visited Vienna, where, though Joseph Haydn and Albrechtsberger were both receiving pupils, his father preferred placing him under Abt Vogler. Through Vogler's instrumentality Carl Maria was appointed conductor of the opera at Breslau, before he had completed his eighteenth year. In this capacity he greatly enlarged his experience of the stage, so that he ranks among the greatest masters of stage-craft in musical history; but he lived a sadly irregular life, contracted debts, and lost his beautiful voice through accidentally drinking an acid used in lithography—a mishap which nearly cost him his life. These hindrances, however, did not prevent him from beginning a new opera called Rubezladl, the libretto of which was "romantic" in the extreme degree, and Weber worked at it enthusiastically, but it was never completed, and little of it has been preserved beyond a quintet and the masterly overture, which, re-written in 1811 under the title of Der Beherrscher der Geister, now ranks among its author's finest instrumental compositions.

Quitting Breslau in 1806, Weber removed in the following year to Stuttgart, where he had been offered the post of private secretary to Duke Ludwig, brother of Frederick, king of Württemberg. The appointment was a disastrous one. The stipend attached to it was insufficient to meet the twofold demands of the child's social position and the thriftlessness of his father, who was entirely dependent upon him for support. Court life at Stuttgart was uncongenial to him, though he yielded to its temptations. The king hated him and his practical jokes. He fell hopelessly into debt, and, worse than all, became involved in a fatal intimacy with Margarethe Lang, a singer at the opera. Notwithstanding these distractions he worked hard, and in 1809 re-modelled Das Waldmädchen, under the title of Silviana,1 and prepared to produce it at the court theatre. But a dreadful calamity prevented its performance. Franz Anton had misappropriated a large sum of money placed in the young secretary's hands for the purpose of clearing a mortgage upon one of the duke's estates.2 Both father and son were charged with embezzlement, and, on the 9th of February 1810, they were arrested at the theatre, during a rehearsal of Silviana, and thrown by the king's order into prison. No one doubted Weber's innocence, but after a summary trial he and his father were ordered to quit the country, and on the 27th of February they began a new life at Mannheim.

Having provided a comfortable home for his father, and begun a new comic opera, in one act, called Abh Hasson, Weber removed to Darmstadt in order to be near his old master Abt Vogler, and his fellow-pupils Meyerbeer and Gänssbacher. On the 16th of September 1810, he reproduced Silviana at Frankfort, but with very doubtful success. Abh Hasson was completed at Darmstadt in January 1811, after many interruptions, one of which (his attraction to the story of Der Freischütz—see below) exercised a memorable influence upon his later career.

Weber started in February 1811 on an extended artistic tour, during which he made many influential friends, and on the 4th of June brought out Abh Hasson with marked success at Munich. His father died at Mannheim in 1812, and after this he had no settled home, until in 1813 his wanderings were brought to an end by the unexpected offer of an appointment as kapellmeister at Prague, coupled with the duty of entirely remodelling the performances at the opera-house. The terms were so liberal that he accepted at once, engaged a new company of performers, and directed them with uninterupted success until the autumn of 1816. During this period he composed no new operas, but he had written many of his best pianoforte music, and played it with never-failing success, while the disturbed state of Europe inspired him with some of the finest patriotic melodies in existence. First among these stand ten songs from Körner's Leyer und Schneer, including "Vater, ich rufe dich," and "Lützow's wilde Jagd"; and in no respect inferior to these are the splendid choruses in his cantata Kämpf und Sieg, which was first performed at Prague, on the 22nd of December 1815.

Weber resigned his office at Prague on the 30th of September

---

1 As the MS. of Das Waldmädchen has been lost, it is impossible now to determine its exact relation to the later work.

2 Spitta gives a different account of the occurrence, and attributes the robbery to a servant.
WEBER, C. VON

1816, and on the 21st of December, Frederick Augustus, king of Saxony, appointed him kapellmeister at the German opera at Dresden. The Italian operas performed at the court theatre were superintended by Morlacchi, whose jealous and intriguing disposition gave endless trouble. The king, however, placed the two kapellmeisters on an exact equality both of title and salary, and Weber found ample opportunity for the exercise of his remarkable power of organization and control. He now gave his close attention to the story of Der Freischütz, which he had previously meditated turning into an opera, and, with the assistance of Friedrich Kind, he produced an admirable work under the title of Des Jügers Braut. No subject could have been better fitted than this to serve as a vehicle for the new art-form which, under Weber's skilful management, developed into the type of "romantic opera." He had dealt with the supernatural in Rübenzahl; and in Sylva in with the pomp and circumstance of chivalry; but the shadowy impersonations in Rübenzahl are scarcely less human than the heroine who invokes them; and the music of Sylva might easily have been adapted to a story of the 15th century. But Weber now knew better than to let the trend in Der Freischütz sing with three soft strokes of a drum below an unchanging dismal chord he brings him straight to us from the nether world. Every note in Euryanthe breathes the spirit of medieval romance; and the fairies in Oberon have an actuality quite distinct from the tinsel of the stage. This uncompromising reality, even in face of the unreal, forms the strongest characteristic of the pure "romantic school," as Weber understood and created it. It treats its wildest subjects in earnest, and without a doubt as to the reality of the scenes it ventures to depict, or the truthfulness of their dramatic instances.

Weber wrote the first note of the music of Der Freischütz on the 2nd of July—beginning with the duet which opens the second act. But so numerous were the interruptions caused by Morlacchi's intrigues, the insolence of unfriendly courtiers, and the attacks of jealous critics that nearly three years elapsed before the piece was completed. In the meantime the performances at the opera-house were no less successfully remodelled at Dresden than they had already been at Prague, though the work of reformation was far more difficult; for the new kapellmeister was surrounded by enemies who openly subjected him to ridicule. Though the composer himself was at one time strongly prejudiced against him, Happily, he no longer stood alone in the world. Having, after much difficulty, broken off his liaison with Margarethe Land, he married the singer Carolina Brandt, a noble-minded woman and consummate artist, who was well able to repay him for the part he had long played in her mental development. The new opera was completed on the 15th of May 1820, on which day Weber wrote the last note of the overture—which it was his custom to postpone until the rest of the music was finished. There is abundant evidence to prove that he was well satisfied with the result of his labours; but he gave himself no rest. He had engaged to compose the music to Wolf's Gipsy drama, Preciosa. Two months later this also was finished, and both pieces ready for the stage.

In consequence of the unsatisfactory state of affairs at Dresden, it had been arranged that both Preciosa and Der Freischütz—no longer known by its original title, Des Jügers Braut—should be produced at Berlin. In February 1821 Sir Julius Benedict was accepted by Weber as a pupil; and to his pen we owe a delightful account of the rehearsals and first performance of his master's chef-d'oeuvre. Preciosa was produced with great success at the old Berlin opera-house on the 14th of June 1821. On the 18th of June, the anniversary of the battle of Waterlooo, the opening of the new "Schauspielhaus" was celebrated by the production of Der Freischütz. Much anxiety was caused by unforeseen difficulties at the rehearsals; yet, so calm was Weber's mind that he devoted his leisure time to the composition of his Concertstück in F minor—one of his finest pianoforte pieces. Until the last moment his friends were anxious; the author was not; and the result justified his confidence in his own powers. The success of the piece was triumphant. The work was received with equal enthusiasm at Vienna on the 3rd of October, and at Dresden on the 26th of January 1822. Yet Weber's position as kapellmeister was not much improved by his success, though, in order to remain faithful to his engagements, he had refused tempting offers at Berlin and Cassel, and, at the last-named place, had installed Ludwig Spohr in a position much more advantageous than his own.

For his next opera Weber accepted a libretto based, by Frau Wilhelmine von Chezy, on the story of Euryanthe, as originally told in the 16th century, in Gilbert de Montreuil's romance of Violette, and repeated with alterations in the Decameron, in Shakespeare's Cymbeline, and in several later forms. In place of the ghostly horrors of Der Freischütz, the romantic element was here supplied by the chivalric pomp of the middle ages. The libretto is in one respect superior to that of Der Freischütz, inasmuch as it substitutes elaborate recitative for the spoken dialogue peculiar to the German "Schauspiel" and French "opera comique." It is, in fact, a "grand opera," in every sense of the words,—the prototype of the "music drama" perfected forty years later by Wagner. The overtures, however, written at the time, represent a feature that has never been imitated. During its performance the curtain temporarily rises, to exhibit, in a tableau vivant, the scene in the sepulchral vault upon which the whole story turns. This direction is now rarely carried out; but Weber himself well knew how much the interest of the piece depended on it. The work was produced at the Kärntnther theatre in Vienna, on the 23th of October 1823, and received with enthusiasm.

Weber's third and last dramatic masterpiece was an English opera, written for Covent Garden theatre, upon a libretto adapted by Phanclés from Wieland's Oberon. It was disfigured by the spoken dialogue abandoned in Euryanthe; but in musical beauty it is quite equal to it, while its fairies and mermaids are as vividly real as the spectres in Der Freischütz. Though already far gone in consumption, Weber began to compose the music on the 23rd of January 1825. Charles Kemble had offered him £1000 for the work, and he could not afford to rest. He finished the overture in London, at the house of Sir George Smart, soon after his arrival, in March 1826; and on the 12th of April the work was produced with triumphant success. But, it Vogel the composer his life, Weber carried out with rehearsed and performances of the opera, and concerts at which he was received with rapturous applause, he grew daily perceptibly weaker; and, notwithstanding the care of his kind host, Sir George Smart, and his family, he was found dead in his bed on the morning of the 5th of June 1826. For eighteen years his remains rested in a temporary grave in Moorfields chapel; but in 1844 they were removed and placed in the family vault at Dresden, Wagner making an eloquent speech.

Besides his three great dramatic masterpieces and the other works already mentioned, Weber wrote two masses, two symphonies, eight cantatas, and a large number of songs, orchestral and pianoforte pieces, and music of other kinds, amounting altogether to more than 250 compositions.

Weber's style rises, in his three greatest works, to heights which show his kinship with the great classics and the great moderns. His intellect was quick and clear; but yet finer was the force of character with which he overcame the disadvantages of his feeble health, desultory education and the mistakes of his youth. With such gifts of intellect and character, every moment of his short life was precious to the world; and it is impossible not to regret the placing of his training in the hands of Abt Vogel. Weber's master was an amiable charlatan, whose weakness as a teacher was thoroughly exposed, in partial innocence, by his two illustrious pupils. Meyerbeer wished to be famous as the maker of a new epoch in opera. Weber could not help being so in reality. But he was sadly hampered by his master's inability to teach realities instead of appearances; and to this impediment alone must we assign the fact that his masterpieces do not begin earlier in his career. With extraordinary rapidity and thoroughness he learnt English a year before his death in order to compose Oberon, with the result
WEBER, W. E.—WEBER’S LAW

that there is only one obvious mistake in the whole work, and
the general correctness of declamation is higher than in most
of his German works. This is typical of Weber's general culture,
mental energy and determination; points in which, as in many
traits in his music, he strikingly resembles Wagner. But all
his determination could not quite repair the defects of his purely
musical training, and though his weaknesses are not of glaring
effect in opera, still there are moments when even the stage
cannot explain them away. Thus the finale of Der Freischütz
breaks down so obviously that no one thinks of it as anything
but the inevitable result of roughing-it on the way to success;
and this might have made quite a subject for musical treatment. In
Euryanthe Weber attained his full power, and his inspiration
did not leave him in the lurch where this work needed large
musical designs. But the libretto was full of absurdities; especially
in the last act, which not even a remodelling under Weber's
direction could redeem. Yet it is easy to see why it fascinated
him, for, whatever may be said against it from the standpoints
of probability and literary merit, its emotional contrasts are
highly musical. Indeed it is through them that the defects invite
criticism.

Oberon is spoilt by the old local tradition of English opera
according to which its libretto admitted of no music during
the action of the drama. Thus Weber had in it no opportunity
for his musical stage-craft; apart from the fact that the action
itself is entirely without dramatic motive and passion, since
the characters are simply shifted from Bordeaux to Bagdad
whenever Oberon waves his wand.

Many attempts have been made to improve the libretti of
Euryanthe and Oberon, but none are quite successful, for Weber
has taken a great artist’s pains in making the best of bad material.
All that can be said against Weber’s stage treatment is that it
more emphatically bore his name and how complete in essentials
was his success and his claim to immortality. His pianoforte
works, while showing his helpfulness in purely musical form,
more than bear out his contemporary reputation as a very great
pianoforte player. They have a pronounced theatrical tendency
which, in the case of such pieces of gay romanticism as the
Invitation à la danse and the Concertstück, is amusing and by
no means inartistic. In orchestration Weber is one of the
greatest masters. His treatment of the voice is bold and interesting,
but very racy; and his declamation of words is often incorrect.
His influence on the music of his own day is comparable to his influence on posterity; for he was not only
a most efficient director but a very persuasive journalist; and
in spite of the inexperience that made him disapprove of
Beethoven for all good music other than his own he showed a growing enthusiasm which was infectious.

WEBER, WILHELM EDUARD (1804–1891), German physicist,
was born at Wittenberg on the 24th of October 1804, and was
a younger brother of Ernst Heinrich Weber, the author of Weber's Law (see below). He studied at the university of Halle, where
he took his doctor's degree in 1826 and became extraordinary
professor of physics in 1828. Three years later he removed to
Göttingen as professor of physics, and remained there till 1837,
when he was one of the seven professors who were expelled
from their chairs for protesting against the action of the king of
Hanover (duke of Cumberland) in suspending the constitution.
A period of retirement followed this episode, but in 1843 he
accepted the chair of physics at Leipzig, and six years later
returned to Göttingen, where he died on the 23rd of June 1891.
Weber is especially known for his work on electrical measurement.
Until his time there was no established system either of stating or measuring electrical quantities; but he showed,
as his colleague K. F. Gauss did for magnetic quantities, that it
is both theoretically and practically possible to define them,
not merely by reference to other arbitrary quantities of the same
kind, but absolutely in terms in which the units of length,
time, and mass are alone involved. He also carried on extensive
researches in the theory of magnetism; and it is interesting that
in connexion with his observations in terrestrial magnetism he
not only employed an early form of mirror galvanometer, but
also, about 1833, devised a system of electromagnetic telegraphy,
by which a distance of some 9000 ft. was worked over. In
conjunction with his elder brother he published in 1825 a
well-known treatise on waves, Die Wellenlehre auf Experimentale
gegründet; and in 1833 he collaborated with his younger brother,
the physiologist Eduard Friedrich Weber (1806–1871), in an
investigation into the mechanism of walking.

WEBER'S LAW, in psychology, the name given to a principle
first enunciated by the German scientist, Ernst Heinrich Weber
(1795–1878), who became professor at Leipzig (of anatomy,
1831–1866; of physiology, 1846). In his work on the senses, he
at last fitted into an important department of experimental psychology. It deals with the quantitative aspects of mental facts—their intensity or quantity proportional to their duration; but in the case of some of the senses, to measure with accuracy the objective amount of the stimulus, and introspection enables us to state
the nature of the subjective result. Thus we are able to say whether a stimulus produces any perceptual result, and can fix in this way the minimum sensible or "threshold of consciousness" for each of the senses. In like manner (though with less accuracy, owing to the disturbing nature of the conditions in which the sensations are measured, the dependence of the minimum threshold of the different senses, that is, to say, the point beyond which no increase of stimulus produces any appreciable increase of sensation. We thus determine, as Wundt puts it, "the values between which changes in the sensations are accompanied by changes in sensation. But the central inquiry of psycho-physics remains behind. Between the quantitative minimum and the quantitative maximum thus fixed can we discover any definite relation between changes in the objective intensity of the
stimuli and changes in the intensity of the sensations as estimated
by consciousness. The answer of psycho-physics to this inquiry is
given in the generalization variously known as "Weber's law,"
"Fechner's law," or the "psycho-physical law," which professes to
formulate with exactitude the relations which exist between change of stimulus and change of sensation.

We have now to study how we may practically measuring the absolute intensity of our sensations, it is necessary to depend upon the mental estimate or comparison of two or more sensations. Comparison enables us to say whether they are equal in intensity, or if unequal which is the greater, and in the greater or less the threshold of equality in this respect it becomes more and more difficult to detect the difference. By a series of experiments, therefore, it will be possible to show the care we must extend, in order to determine the least observable difference in intensity between two sensations of any particular sense. This least observable difference is called by
Fechner the Unterschiedsschwelle or "difference-threshold," that is
to say, the limit of the discriminative sensibility of the rence in
question. That such a "threshold," or least observable difference,
exists is plain from very simple examples. Very small increases may
be made in the object amount without light, sound or pressure—that is,
in the physical stimulus of the two senses—without the subject
on whom the experiment is made detecting any change. It is further
evident that, by means of this Unterschiedsschwelle, it is possible to
come to a considerable knowledge of the discriminative sensibility
of different senses, or (as in the case of the skin) of different parts
of the same sense organ: the smaller the difference observable the finer
the discriminative sensibility. Thus the discrimination of the muscular
sensibility is much more delicate than the tactile or thermal, and the
discriminative sensibility of the skin and the retina varies
very much according to the parts of the surface affected. Various
measures have been attempted to determine the limit of
discriminative sensibility with an approach to scientific precision.
The first is that employed by Weber himself, and has been named
the method of just observable differences. It consists either in
gradually adding to the stimulus small successive increments until
cause no perceptible difference in sensation but at a certain point do
cause a difference to emerge in consciousness, or, vice versa, in gradually
decreasing the amount of additional stimulus until the difference
originally perceived becomes imperceptible. By taking the average of a number of such results, the minimum may be determined with
tolerable accuracy. The second method is called by Fechner the
method of correct and incorrect instances. When two stimuli are
very nearly equal the subject will often fail to recognize which is the greater, saying sometimes that A is greater, sometimes that B is greater, and in neither case although the muscular sense most exactly in the case of sound. As this is the sense which affords the greatest facilities for measuring the precise amount of the stimulus, it may perhaps be inferred, that we could attain the same exactitude in the other senses, with the same comparative insensitivity of our sediments. The law would vindicate itself with the same exactitude and certainty. It is further to be noted, that however in those senses in which it is not actually exact, the law holds with stringency only within certain limits. The results are most exact in the middle regions of the sensory scale; but we approach the lower limit of sensibility they become quite uncertain.

WEBSTER, A.—WEBSTER, D. (1896); contains an elaborate exposition of the whole subject. He replied to his critics in two later works, In Suchen der Psychophysik (1877) and Revision der Hauptpunkte der Psychophysik (1882), Delboor's Studie psychophysique (1875), Examen critique de la theorie psychophysique (1883), and Elements de psychophysique generale et speciale (1885), and G. E. Müller's Zur Grundlegung der Psychophysik (1878) are important documents; and the subject is fully treated in Wundt's Grundzüge der psychologischen Physiologie (ed. 1902-1903), and "Über die Methode d. Minimallitungen," in Physis (Leipzig, 1883), or, more popularly, in his Human and Animal Psychology (2nd ed., 1892), Lectures 2, 3, 4. See also Ladd's Physiological Psychology (1887), which is based upon Wundt; Meinong. in Zeitschrift für Psychologie und Pschophysik (5th ed., Jena, 1896); E. B. Titchener, Experimental Psychology (ii. 1905), Professor James Ward's "Attempt to Introduce Weber's law to the beginners" (5th ed.), p. 452 seqq.; and generally textbooks of psychology, e.g. C. F. Stout's Manual of Psychology, ch. 7 (following Meinong); James's Principles of Psychology, ch. 13; Köhle's Outlines of Psychology, part i. chap. 1 and 3. (A. S. P.-P.)

WEBSTER, ALEXANDER (1707-1784), Scottish writer and minister, son of James Webster, a covenanting minister, was born in Edinburgh in 1707. Having become a minister in the church of Scotland, he propounded a scheme in 1742 for providing pensions for the widows of ministers. The tables which he devised for the office of the Roman Catholic Church of Scotland were based on a system of actuarial calculation that supplied a precedent followed by insurance companies in modern times for reckoning averages of longevity. In 1745 he defended his case before the House of Commons in a debate on the subject of the right of the people to be measured, and his advocacy of the freedmen. The law has been variously interpreted. Fechner himself designated it the "psychophysical law," and treated it as the fundamental formula of the relation between body and mind, thus assigning to it an ontological significance as the psychic law. The psychophysical interpretation of his results he has not had a following. Wundt interprets the law in a purely "psychological" sense, making it a special instance of the general law of relativity which governs our mental states. Introspection can give us no information as to the absolute intensity of the stimulus; for a stimulus is known in consciousness only through its resultant sensation. Hence, he argues, we can only compare the psychical state with another, and our standard of measurement is thereby to some extent relative; it depends directly upon the preceding state with which we compare the present. Others (e.g. G. E. Müller) have attempted to give the law an "empirical" meaning. Bühler holds that the expression of the law is a recondite relation between the material and the spiritual world, they prefer to regard the quantitative relation between the last physical antecedent in the chain of events, not as a genuine fact of interrelation, but as a simple proportion, and to treat Weber's law as holding between the initial physical stimulus and the final action of the nerve-centres. According to this view, Weber's law may be altogether a phenomenon of the nature of nervous action. As a nerve, says Sully, after a temporary degree of stimulation temporarily loses its sensitivity, so the greater the previous stimulation of a nerve the greater is the additional stimulus required to produce an appreciable amount of sensation.

Weber's law, it must be added, holds only within certain limits. In the case of the chemical senses of taste and smell experiments are almost impossible. It is not the absolute amount of the stimulus with the necessary exactitude, and the results are further vitiated by the long continuance of the physiological effects. The same considerations apply with still more force to the organic sensations, and the results in the case of temperature sensations are completely uncertain. The law is approximately true in the case of sight, bearing the same proportion to the size of the object as the size of the error to the amount of the error.

WEBSTER, BENJAMIN NOTTINGHAM (1797-1882), English actor, manager and dramatic writer, was born in Bath on the 3rd of September 1797, the son of a dancing master. First appearing as Harlequin, and then in small parts at Drury Lane, he went to the Haymarket in 1829, and was given leading comedy character business. He was the lessee of the Haymarket from 1837; he built the new Adelphi Theatre (1859); later the Olympic, Princess's and St James's came under his control; and he was the patron of all the contemporary playwrights and many of the best actors, who owed their opportunity of success to him as a character actor he was unequalled in his day, especially in such parts as Triplet in Masks and Faces, Joey Ladle in No Thoroughfare, and John Peerybingle in his own dramatic adaptation of The Chatterton on the Heath. He wrote, translated, or adapted nearly a hundred plays. Webster took his formal farewell of the stage in 1874, and died in London on the 2nd of July 1882. His daughter, Harriette Georgiana (d. 1897), was the first wife of Edward Levy-Lawson, 1st baron Burnham; and his son, W. S. Webster, had three children—Benjamin Webster (b. 1864; married to Miss May Whitby), Annie (Mrs A. E. George) and Lizzie (Mrs Sydney Brough)—all well known on the London stage, and further connected with it in each case by marriage.

WEBSTER, DANIEL (1782-1852), American statesman, was born in Salisbury (now Franklin), New Hampshire, on the
WEBSTER, D.

18th of January 1782. He was a descendant of Thomas Webster, of Scottish ancestry, who settled in New Hampshire about 1636. His father, Ebenezer Webster (1739-1806), was a sturdy frontiersman; when, in 1763, he built his log cabin in the town of Salisbury there was no habitation between him and Canada. He was a member of Rogers' Rangers in the Seven Years' War, served in the War of Independence, was for several years a member of the New Hampshire legislature, was a delegate to the New Hampshire convention which ratified the Federal constitution, and was a justice of the court of common pleas for his county. Daniel was a frail but clever child, and his family made great sacrifices to give him and his elder brother Ezekiel a good education. He attended Phillips Exeter Academy about nine months in 1794, was further prepared for college by Dr Samuel Wood, the minister at Boscawen, and graduated at Dartmouth College in 1801. He was chosen Fourth of July orator in Hanover, the college town, in 1800, and in his speech appears the substance of the political principles for the development of which he is chiefly famous. After graduation he began the study of law in his native town. When in the following winter money had to be earned to enable Ezekiel to remain in college, Daniel accepted the principalship of the academy at Fryeburg, Maine; but he resumed his law studies in the following year, and in 1804, with Ezekiel's assistance, he was enabled to go to Boston and conclude his studies under Christopher Gore (1758-1827), later governor of Massachusetts (1809-1810) and the year before, 1817-1818, had been associated with the noted lawyer and political leader John C. Calhoun was chairman, and for some forty years these three constituted a great triumvirate in American politics. Webster had been in the House less than three weeks when he greatly embarrassed the administration by introducing a set of resolutions asking for information relating to the immediate cause of the war. In January 1814, when a bill to encourage enlistments was before the House, he attacked the conduct of the war in his first great speech. An even more forcible speech, delivered later in the same session, in support of a bill for repealing the non-importation acts, marked him as one of the foremost men in Congress. He successfully opposed a bill providing for what would have been practically an irredeemable currency, and he voted against the bill for chartering the second United States bank, although it provided for the redemption of bank notes in specie, because he objected to permitting the government to have so large a share in its management. Webster removed to Boston in June 1816. This cost him his seat in Congress after the 4th of March 1817, and for the next six years he was engaged chiefly in the practice of law in the courts of Massachusetts and before the U.S. Supreme Court.

His first leading case before the Supreme Court was the Dartmouth College Case. In 1815, when the Dartmouth board of trustees was rent by factions, the majority, who were Federalists and Congregationalists, removed the president, John Wheelock, who was a Presbyterian, and appointed Francis Brown in his place. Wheelock appealed to the legislature in the following year, when it was strongly Republican, and that body responded by passing acts which virtually repealed the charter received from George III., created a state university, placed Wheelock at its head, and transferred to it the property of the college. The case came before the Supreme Court of New Hampshire in May 1817. Jeremiah Mason (1768-1848), a lawyer of the first rank, Jeremiah Smith and Webster appeared for the college, and argued that these acts were invalid because they were not within the general scope of the legislature's power, because they violated provisions of the state constitution and because they violated the clause of the Federal Constitution which prohibits a state from impairing the obligation of contracts but the court decided against them. On the last point, however, the case was carried to the Supreme Court of the United States, and there Webster, speaking principally of his colleagues at the state trial and making a powerful appeal to the emotions of the court, won the case for the college and for himself the front rank at the American bar. The result, too, vindicating as it did the supremacy of the Constitution of the United States, was a substantial gain for that nationalism which Webster advocated in his first Fourth of July oration at Hanover, and the promotion of which was for the remainder of his career his principal service to his country. His next great case was that of M'Culloch v. Maryland. Maryland had imposed a tax upon the Baltimore branch of the Bank of the United States. The Maryland Court of Appeals sustained the validity of this act. Webster, supported by William Pinkney and William Wirt, argued in February 1819, (1) that the power to establish a bank was to be implied from the general power given to Congress to administer the financial affairs of the nation, and was a means of administering the finances which was appropriate and within the discretion of Congress; (2) that "the power to tax is the power to destroy," and that a state had not the constitutional power to impose a tax upon any instrumentality of the government of the United States. Maryland had sustained these arguments and the act of Maryland was held to be void. Several years later (1823) Webster argued the case of Gibbons v. Ogden. The state of New York, in order to reward the enterprise of Robert R. Livingston and the inventive genius of Robert Fulton in the application of the steam engine to traffic on the water, had given to them a monopoly of all transportation by steam within the waters of New York. The highest court of that state sustained the validity of the monopoly. Gibbons, who had begun to run a steamboat from New Jersey, appealed to the Supreme Court. Webster argued that the Federal Constitution gave to Congress control over interstate commerce, and that any interference by the legislature of a state with this commerce was unconstitutional and void. The Supreme Court so held; its opinion, written by Chief Justice Marshall, being little else than a recital of Webster's argument. In the case of Ogden v. Saunders, heard in 1824 and reheard in 1827, in which the question was the validity or invalidity of the insolvent laws of the several states, Webster argued that the clause prohibiting a state from impairing the obligation of contracts applied to future as well as past contracts, but the court decided against him.

Webster was recognized as the first American orator. His oration at Plymouth, on the 22nd of December 1820, on the second centennial anniversary of the landing of the Pilgrims, placed him in this rank. No man mastered more thoroughly the fundamental principles of government and the currents of feeling which influence the destiny of nations. His oration in 1825 at the laying of the corner stone of the Bunker Hill monument contained perhaps the clearest statement to be found anywhere of the principles underlying the American War of Independence. In the following year Webster delivered the memorable speech in the Senate in which he reviewed the conduct of the First and third presidents of the United States—John Adams and Thomas Jefferson—who died on the 4th of July 1826; it is particularly remarkable for Adams's imaginary reply in the Continental Congress to the arguments against a Declaration of Independence, beginning with the familiar quotation: "Sink or swim, live or die, survive or perish, I gave my hand and my heart to this vote." Webster's physical endowments as an orator were extraordinary. Thomas Carlyle thus describes him as he appeared in London in 1839. "Many months ago I saw the most notable of your notabilities, Daniel Webster. He is a magnificent specimen. You might say to all the world, 'This is our Yankee Englishman; such limbs we make in Yankee land.' As a logic fencer, or parliamentary Hercules, one would be inclined to back him at first sight against all the extant world. The tangled complex, that amorphous crag-like
WEBSTER, D. 461

face; the dull black eyes under the precipice of brows, like dull anthracite furnaces, needing only to be blown; the mastiff mouth secreted in a breath, so much of silent Berserk rage that I remember in any man."

In 1820 Webster took an important part in the convention called to revise the constitution of Massachusetts, his arguments in favour of removing the religious test, in favour of retaining the doctrine of nullification, in the Senate, and in favour of increasing the independence of the judiciary, being especially notable. He was a member of the National House of Representatives from 1823 to 1827 and of the Senate from 1827 to 1841. Soon after returning to the House he supported in a notable speech a resolution to send a commissioner to Greece, then in insurrection.

The tariff was to him a distasteful subject, and he was governed in his attitude toward it largely by the wishes of the majority of his constituents. He opposed the tariff bill of 1816 and in 1824, and he repudiated the name of "American system," claimed by Clay for his system of protection. When, however, the tariff bill of 1828, which was still more protective, came up for discussion, Webster had ceased to oppose protection; but he did not attempt to argue in favour of it. He stated that his people, after giving warning in 1824 that they would consider protection the policy of the Government, had gone into protected manufactures, and he now asked that that policy be not reversed to the injury of his constituents. In later speeches, too, he defended protection rather as a policy under which industries had become established than as a scheme if the stage had been clear for the adoption of a new policy.

The tariff of 1828 aroused bitter opposition in South Carolina, and called from Vice-President Calhoun the statement of the doctrine of nullification which was adopted by the South Carolina legislature at the close of the year and is known as the South Carolina Exposition. Senator Robert Y. Hayne, from the same state, voiced this doctrine in the Senate, and Webster's reply was his most powerful exposition of the national conception of the Union. The occasion of this famous Webster-Hayne debate was the introduction by Senator Samuel A. Foot (1780-1856) of Connecticut of a resolution of inquiry into the expediency of restricting the sales of the Western lands. This was on the 26th of December 1832, and after Senator Benton of Missouri had denounced the resolution as one inspired by hatred of the East for the West, Hayne, on the 16th of January 1833, made a vigorous attack on New England, and declared his opposition to a permanent revenue from the public lands or any other source on the ground that it would promote corruption and the consolidation of the government and "be fatal to the sovereignty and independence of the states." Webster's brief reply drew from Hayne' a warning that "in the event of his party," and all his cabinet except Webster resigned. Webster hesitated, but after consultation with a delegation of Massachusetts Whigs decided to remain. Although he was severely criticized there were good reasons for his decision. When he entered office the relations between the United States and Great Britain were critical. The M'Leod case in which the state of New York insisted on trying a British subject, with whose trial the Federal government had no power to interfere, while the British government had declared that it would consider conviction and execution a casus belli; the exercise of the hateful right of search by British vessels on the coast of Africa; the Maine boundary, as to which the action of a state might at any time bring the Federal government into armed collision with Great Britain—all these at once met the new secretary, and he felt that he had no right to abandon his work for party reasons. With the special commissioner from Great Britain, Lord Ashburton, he concluded the treaty of 1842 known as the Webster-Ashburton Treaty. Differences arising out of the M'Leod case were adjusted by extending the principle of extradition. The question of the suppression of the African slave trade, with which was connected the right of search, was settled by an agreement that the United States should keep in service off the coast of Africa a squadron carrying not fewer than eighty guns, and that the two squadrons should act in concert when necessary. The North-east boundary dispute was settled by a compromise which allowed Maine about 5500 sq. m. less than she had claimed, and allowed Great Britain about as much less on her claim, and by an agreement on the part of the government of the United States to pay to Maine and Massachusetts "in equal moieties" the sum of $300,000 for their assent (see Matvev). Immediately after the treaty had been concluded the Whigs insisted that Webster should leave the cabinet. He refused, for a time, to be driven, but because of their continued attacks, together with his ambition to become president, and because Tyler favoured the annexation of Texas while he was opposed to it, he resigned in May 1843. He was forgiven by his party in the following year, but not until the opposition, provoked by the retention of his position under Tyler, had ruined whatever

1 This case grew out of the Canadian rebellion of 1837. Alexander M'Leod boasted in November 1840 that he was one of a Canadian party of more than 3500 who had conspired and in December 1837, had captured and burned a small American steamboat, the "Caroline," and in the course of the attack it had shot Amos Durfee. The Canadian commander had regarded the "Caroline" as being in the service of the insurgents and had asked for volunteers to destroy her (see SEWARD, W. H.).
chance he might have had in that year of receiving the presidential nomination. In June 1843, on the occasion of the completion of the Bunker Hill monument, Webster delivered another classic oration. In February 1844 he argued the Girard Will Case before the United States Supreme Court. Stephen Girard (q.v.) had devised and bequeathed the residue of his estate for the establishment and maintenance of Girard College, in which no member of the Gospel of any sect or denomination whatever should be admitted. The suit was brought to break the will, and Webster, for the plaintiffs, after stating that the devise could stand only on condition that it was a charity, argued that it was not a charity because no teaching was such except Christian teaching. He made an eloquent plea for Christianity, but his case was weak in law, and the court sustained the will.

Webster was returned to the Senate in 1845. He opposed the annexation of Texas and the Mexican War, and was, as before, the recognized spokesman of his party. At the beginning of the quarrel of the North and the South over the organization of the territory acquired from Mexico, Calhoun contended that the Constitution of the United States extended over this territory and carried slavery with it, but Webster denied this on the ground that the territory was the property of, not part of, the United States, and Webster's view prevailed. The whole matter had, therefore, to be adjusted by Congress, and as the growing intensity of the quarrel revealed the depth of the chasm between the sections, Clay came forward with the famous compromise of 1850, and Webster's greatest oration, "The Compromise and the Constitution and the Union," or as it is more commonly known, "The Seventh of March Speech,"—was in support of this Compromise. It was a noble effort to secure a lasting settlement of the slavery question, but he was bitterly denounced throughout the north as a renegade. In July 1850 Webster again became secretary of state, in the cabinet of President Fillmore. Perhaps the most important act of his second term was obtaining the release of Kosstush and other Hungarian refugees who had fled to Turkey, and whose surrender had been demanded by the Austrian government. He died at his home in Marshfield, Massachusetts, on the 24th of October 1852. Webster was twice married—first in 1808 to Grace, daughter of Rev. Elijah Fletcher, a New Hampshire clergyman. She died in 1828, leaving two sons, Daniel Fletcher, killed in the second battle of Bull Run, and Edward, a major in the United States army, who died while serving in the Mexican War, and a daughter Julia, who married Samuel Appleton. Webster's second wife was Caroline Le Roy, daughter of Jacob Le Roy, a New York merchant. He was married to her in 1829 and she survived him.

The universal expression of respect and admiration at the time of his death showed that he had retained the confidence and the respect of his people. Never, since the death of Washington, had there been in the United States such a universal expression of public sorrow and bereavement. It is not too much to say that the conviction of the justice of their cause that carried the northern states successfully through the Civil War was largely due to the arguments of Webster. He had convinced the majority of the people that the government created by the Constitution was not a league or confederacy, but a Union, and had all the powers necessary to its maintenance and preservation. He had convinced the Supreme Court, and every body of American jurists, that whenever a power is granted by a Constitution, everything that is fairly and reasonably involved in the exercise of that power is granted also. He established the freedom of the instrumentalities of the national government from adverse legislation by the states; freedom of commerce between the different states; the right of Congress to regulate the entire passenger traffic through and from the United States, and the sacredness of public franchises from legislative assault.

The establishment of these principles was essential to the integrity and permanence of the American Union.

BIBLIOGRAPHY.—The Works of Daniel Webster (6 vols., Boston, 1857) contain a biographical memoir by Edward Everett; G. T. Curtis, Life of Daniel Webster (2 vols., New York, 1870) is the most complete biography, but it is written from the point of view. See also J. W. McIlwhey (ed.), Writings and Speeches of Daniel Webster (18 vols., Boston, 1903); Fletcher Webster (ed.), Daniel Webster's Private Correspondence (2 vols., Boston, 1857); H. C. Lodge, Daniel Webster (Boston, 1899); J. B. Mcmaster, Daniel Webster (New York, 1902); E. W. Wheeler, The Esthonian of the Constitution (New York, 1905); S. W. McCall, Daniel Webster (Boston, 1902); and Norman Hapgood, Daniel Webster (Boston, 1890).
skill. No poet has ever so long and so successfully sustained at their utmost height and intensity the expressed emotions and the united effects of terror and pity. The transcendent imagination and the impassioned sympathy which inspire this most tragic of all tragedies move the ear and are fused together in the fourth act in a creation which has hardly been excelled for unflagging energy of impression and of pathos in all the dramatic or poetic literature of the world. Its wild and fearful sublimity of invention is not more exceptional than the exquisite justice and tenderness and subtlety of its expression. Some of these executive merits may be found in an ill-constructed and ill-conditioned tragi-comedy which was printed in the same year; but few readers will care to remember much more of The Devil's Law Case than the admirable scenes and passages which found favour in the unerring and uniting sight of Webster's first and final interpreter, Charles Lamb. Thirty-one years later (1654) the noble tragedy of Appius and Virginia was given to the world—a work which alone would have sufficed to perpetuate the memory of his author among all competent lovers of English poetry at its best. Seven years afterwards an unprincipled and ignorant bookseller, published, under the title of Two New Plays: viz. A Cure for a Cuckold: a Comedy. The Thracian Wonder, A Comical History. As it hath been several times acted with great Applause, two plays of which he assigned the authorship to John Webster and William Rowley. This attribution may or may not be accurate; the former play is a mixture of the real work by Webster and roguish recollage. An elegy on Henry, prince of Wales, and a few slight occasional verses, compose the rest of Webster's remaining extant works. [Edward Phillips, in his Theatrum poëtarum, wrongly attributed to him a share in The weakest goes to the Wall. The play of Guise, mentioned by Webster himself in the introduction to The Devil's Law Case, is lost.]

Webster's claims to a place among the chief writers of his country were ignored for upwards of two centuries. In 1830 the Rev. Alexander Dyce first collected and edited the works of a poet who had found his first adequate recognition twenty-two years earlier at the pious and fortunate hands of Lamb. But we cannot imagine that a presentiment or even a foreknowledge of this long delay in the payment of a debt so long due from his countrymen to the memory of so great a poet would seriously have disturbed or distressed the mind of the man who has given us the clue to his nature in a single and an imperishable sentence—"I rest silent in my own work." (A. C. S.)

See The Works of John Webster; with some Account of the Author and Notes, by Alexander Dyce (Leeds, 1828); and The Dramatic Works of John Webster, edited by William Hazlitt the younger (1857); The Best Plays of Webster and Touroine, edited by J. A. Symonds for the "Mermaid" series (1888-1903); Love's Graduation . . . (Oxford, 1883), in which Webster's supposed share in A Cure for a Cuckold is presented separately by S. Spring-Rice, with an introduction by Edmund Gosse. See also E. Gosse, Seventeenth-Century Studies (1883); and especially an exhaustive treatise by E. E. Stoll, John Webster. The Period of his Work as determined by his Relations to the Drama of his Day (Boston, Massachusetts, 1906). Mr Stoll's account (see p. 42) shows that the additional bibliographical suggestions made by Mr Sidney Lee in his article in the Dict. Nat. Bio. are not supported.

WEBSTER, NOAH (1756-1843), American lexicographer and journalist, was born at West Hartford, Connecticut, on the 16th of January. His father was a merchant, and his mother, a daughter of Noah Webster, of Hartford, governor of Connecticut in 1656-1657, and on his mother's side from Governor William Bradford of Plymouth. He entered Yale in 1774, graduating in 1778. He studied law, and was admitted to the bar at Hartford in 1781. In 1782-1783 he taught in a classical school at Goshen, New York, and became convinced of the need of better textbooks of English. In 1783-1785 he published at Hartford A Grammatical Institute of the English Language, in three parts, a spelling-book, a grammar and a reader. This was the pioneer American work in its field, and it soon acted a place in most of the schools of the United States. During the twenty years in which Webster was engaged in the dictionary, his income from the spelling-book, though the royalty was less than a cent a copy, was enough to support his family; and before 1816 the sale reached more than a million copies a year. The wide use of this book contributed greatly to uniformity of pronunciation in the United States, and, with his dictionary, secured the general adoption in the United States of a simplified system of spelling. He was a co-author, in fact, of the Americanization of spelling. In 1828 he published Sketches of American Policy, in which he argued for a constitutional government whose authority should be vested in Congress. This he regarded as the first distinct proposal for a United States Constitution, and when in 1787 the work of the commissioners was completed at Philadelphia, where Webster was then living as superintendent of an academy, he wrote in behalf of the constitution an Examination of the Leading Principles of the Federal Constitution. In 1788 he started in New York the American Magazine, but it failed at the end of a year, and he resumed the practice of law at Hartford. In 1793, in order to support Washington's administration, he removed to New York and established a daily paper, the Minerva (afterwards the Commercial Advertiser), and later a semi-weekly paper, the Herald (afterwards the New York Spectator). In 1798 he removed to New Haven. He served in the Connecticut House of Representatives in 1800 and 1802-07, and as a county judge in 1807-11. In 1807 he published A Philosophical and Practical Grammar of the English Language. In 1806 he had brought out A Compendious Dictionary of the English Language, and in 1807 he began work on his dictionary. While engaged on it he removed in 1812 to Amherst, Massachusetts, where he was appointed in 1831 professor of rhetoric and of English at Amherst College. He was also a member of the General Court of Massachusetts. In 1818 he returned to New Haven, and the next year he received the degree of LL.D. from Yale. He spent a year (1824-1825) abroad, working on his dictionary, in Paris and at the university of Cambridge, where he finished his manuscript. The work came out in 1828 in two volumes. It contained 12,000 words and from 30,000 to 40,000 definitions that had not appeared in any earlier dictionary. An English edition soon followed. In 1840 the second edition, corrected and enlarged, came out, in two volumes. He completed the revision of an earlier dictionary a few years before his death, which occurred in New Haven on the 28th of May 1843.

The dictionary was revised in 1817 under the editorship of Professor Chauncy A. Goodrich and published in one volume. In 1859 a pictorial edition was issued. In 1866 it was revised mainly under the direction of Professor Noah Porter, and again in 1890 under the same direction, the latter revision appearing with the title of the International Dictionary of the English Language. The latter was again issued in 1900, with a supplement of 25,000 words and phrases, under the supervision of William Torrey Harris, who edited another revision, in 1909, under the title of the New International Dictionary of the English Language. It has frequently been abridged.

In addition to Webster's own dictionary, he published The Grammar of the English Language (1795), a course of lectures that he had given three years before in some of the chief American cities; Essays (1795); The Revolution in France (1794); A Brief History of Epidemics and Pestilential Diseases (1799, in two vols.; The Rights of Neutral Nations in Time of War (1802); Historical Notices of the Origin and State of Banking Institutions and Insurance Offices (1802); and A Collection of Papers on Political, Literary, and Moral Subjects (1843), which included "On the Supposed Change in the Temperature of Winter," a treatise showing long and careful research. He also published Governor John Winthrop's Journal in 1790, and Dictionary of the United States, of which a revised edition appeared in 1839.

See Memoir of Noah Webster by his son-in-law, Professor Chauncey A. Goodrich, in the quarto editions of the Dictionary, also Noah Webster, (1882), by Horace E. Scudder, American Journal of Letters.

WEBSTER, THOMAS (1773-1844), British geologist, was born in the Orkney Isles in 1773, and was educated at Aberdeen. He subsequently went to London and studied architecture, the Royal Institution in Albemarle Street being built from his design. In 1826 he was appointed house-secretary and curator to the Geological Society of London, and for many years he rendered important services in editing and illustrating the Transactions of the Society. In 1841-1842 he was appointed professor of natural history at the Royal Institution. He has been distinguished for his researches on the Tertiary formations of the Isle of Wight, where he recognized the occurrence of both fresh-water and marine strata; he continued his observations on the mainland of Hampshire, and
subsequently in Dorsetshire, where he described the Purbeck and Portland rocks. To him Sir Henry C. Englefield (1752–1822) was indebted for the geological descriptions and the effective geological views and sections of the Isle of Wight and Dorset that enriched his Description of the Principal Picturesque Beauties, Antiquities and Geological Phenomena of the Isle of Wight (1816). The memorial Websterite was named after him. He died in London on the 26th of December 1844.

WEBSTER, THOMAS (1800–1886), English figure painter, was born at Ranelagh Street, Pinicolo, London, on the 20th of March 1800. His father was a member of the household of George III; and the son, having shown an aptitude for music, became a chorister in the Chapel Royal, St James’s. He, however, developed a still stronger love for painting, and in 1818 he was admitted student of the Royal Academy, to whose exhibition he contributed, in 1824, portraits of “Mrs Robinson and Family.” In the following year he gained the first medal in the school of painting. Till 1879 he continued to exhibit in the Royal Academy work of a genial and gently humorous character, dealing commonly with subjects of familiar incident, and especially of child life. Many of these were exceedingly popular, particularly his “Punch” (1830), which procured in 1841 his election as A.R.A., followed five years later by full membership. He became an honorary retired academician in 1877, and died at Cranbrook, Kent, on the 23rd of September 1886. His “Going into School, of St. Paul’s Trust Board,” and his “Dame’s School” (1854) are in the National Gallery, and five of his works are in the South Kensington Museum.

WEBSTER, a township of Worcester county, Massachusetts, U.S.A., on the French river, about 16 m. S.S.W. of Worcester. Pop. (1890) 7021; (1900) 8824, of whom 3562 were foreign-born; (1910 census), 11,509. Land area (1906), 12-10 sq. m. Webster is served by the New York, New Haven & Hartford, and the Boston & Albany railways, and by interurban electric lines. In the township is Lake Chaubunagungamaug, a beautiful sheet of water above 46 ac. in area. The manufacture of textiles and of boots and shoes is the principal industry; the total value of the factory product in 1905 was $5,867,769. Webster was founded by Samuel Slater (1768–1835), who in 1812 built cotton-mills and in 1815–1816 began the manufacture of woollen cloth. The township, named in honour of Daniel Webster, was erected in 1832 from common lands and from parts of Dudley and Oxford townships, which before the cotton-mills were built there were almost uninhabited.

WECKHERLIN, GEORG RUDOLF (1584–1653), German poet, was born at Stuttgart on the 15th of September 1584. After studying law he settled at Stuttgart, and, as secretary to the Duke Johann Friedrich of Württemberg, was employed on diplomatic missions to France and England. Between 1620 and 1624 he lived in England in the service of the Palatinate, and seems also to have been employed by the English government. In 1644 he was appointed “Secretary for Foreign Tongues” in England, a position in which, on the establishment of the Commonwealth, he was followed by Milton. He died in London of Feb. 1653. Weckherlin was the most distinguished of the circle of South German poets who prepared the way for the Renaissance movement associated in Germany with Martin Opitz. Two volumes of his Oden und Gesänge appeared in 1618 and 1619; his collected Geistliche und weltliche Gedichte in 1641. His models were the poets of the French Pléiade, and with his psalms, odes and sonnets he broke new ground for the German lyric. An epic poem on the death of Gustavus Adolphus, in alexandrines, seems to have won most favour with his contemporaries.

Weckherlin’s Gedichte have been edited by H. Fischer for the Stuttgarter Literarischer Verein (vols. cxcv.–cc., 1894–1905). Selections were published by W. Müller (1823) and K. Goecke (1873). See also C. P. Conze, Nachrichten von dem Leben und den Schriften Weckherlins (1863); E. Hüppner, G. R. Weckherlins Oden und Gesänge (1866); H. Fischer, Beiträge zur Literaturgeschichte Schwabens (1891); and the same author’s article in the Allgemeine deutsche Biographie (1896).

WEBDELBURN, JAMES (1493–1533), JOHN (1500–1556) and ROBERT (1502–1526), Scottish poets and religious reformers, were natives of Dundee, where their father James Wedderburn was a prosperous merchant. All three brothers studied at St Andrews University. James Wedderburn, who became one of the first students to be employed at the France preparing for a mercantile career. On his return to Dundee in 1544, he received instruction in the Reformed faith from Friar Hewatt, a Dominican monk. He composed a play on the beheading of St John the Baptist, and another, a morality satirizing church abuses, in the setting of episodes from the story of Dionysius the Tyrant, both of which were performed in 1546 in the playfield of Dundee. Neither of these nor a third ascribed to him by Calderwood, the historian, are extant. A charge of hereesy was brought against him, but he escaped to France, and established himself as a merchant in Rouen, Dieppe, where he lived unmolested until his death in 1553, although attempts were made by the Scottish community there to bring further charges against him.

John Wedderburn graduated M.A. at St Andrews in 1528. He took priests’ orders and appears to have held the chaplaincy of St Matthews, Dundee, but in March 1539 he was accused of hereesy, apparently for having, in conjunction with his brothers, written some anti-Catholic ballads. He escaped to Wittenberg, where with other of his compatriots he received the teaching of the German reformers. There he gained an acquaintance with the Lords town-hall and was sent back to Scotland. The death of James V. and the known leanings of the regent, the earl of Arran, to reform, encouraged many exiles, Wedderburn among them, to revisit Scotland. It is probable that he was the author of the greater portion of the Compendious Book of Psalms and Spiritual Songs which contains a large number of hymns from the German. The enormous influence of the collection, with its added Gude and God tile Ballatis, on Scottish reform, is attested by the penalites enacted against the authors and printers of these books. John Wedderburn died in Dundee as late as 1546, when he was obliged to flee to England. John Johnstone in his Corinlus martyr says he died in exile in 1536.

Robert Wedderburn, who graduated M.A. in 1530, was ordained priest, and succeeded his uncle John Barry as vicar of Dundee; but before he came into actual possession he also was suspected of heresy, and was compelled to flee to France and Germany. He returned to Scotland in 1546. He appears to have been actual vicar of Dundee in 1552. His sons were legitimized in January 1553.

The earliest known edition of the Compendious Book of Psalms and Spiritual Songs (of which an unique copy is extant) dates back to 1567, though the contents were probably published in broad sheets during John Wedderburn’s lifetime. It consists of a calendar and a number of Psalms and Spiritual Songs, and includes the German, metrical versions of the Psalms, and a collection of ballads and satirical poems against the Catholic church and clergy. The separate shares of the brothers in this compilation cannot be settled, but Robert is said to have edited the whole and added the section of “gude and godtile ballatitis.” Many of these ballads are adapted from secular songs. Editions of the book appeared in 1578 (printed by John Ros), in 1600 (by Robert Smith), in 1621 (by Ando Hart); selections were published by Lord Hailes (1765) and by Sibbald (1802); a reprint of the 1621 volume was edited by Sir J. G. Dalvell in Scottish Poets of the Sixteenth Century (1803); and of the 1578 volume by David Laing in 1868. In 1897 a song, E. Mitchell reprinted the 1567 volume (exaggerated) for the Scottish Text Society.

Wedderburn’s “Complaint of Scotlande” (1549) has been variously assigned to Robert Wedderburn, Sir David Inglis and Sir James Inglis, who was chaplain of the Abbey of Cambuskenneth from about 1508 to 1550. It is a prose treatise pleading for the maintenance of the Scottish alliance with France, written by a mercantile adventurer and money-lender. It is dedicated to Mary of Guise, and consists of the “Dreme” of Dame Scotia and her complaint against her three sons. These two sections are connected by a Monologue Recreatif,‘ in which the author delineates his own character, his love of knowledge, his love of travel, and tales of astronomy, natural history and naval matters. Four copies of this work are extant, but in none is the title-page preserved. In the Harleian catalogue the book is entered as Wedderburn’s Complainte of Scotlande, wyth ane Exhortation to the three Estatis to be vigilante in the Defens of their Public Veil” (1539) (Catalogue Bibliothecae Angliae).
WEDDING—WEDGWOOD

Hadleianae, vol. i. no. 8371). This title, which is repeated with variations in spelling in vol. iv. no. 12070, bears every mark of authenticity. The book appears to have been printed in France, and the idea of Dame Scotia's exhortations to her sons, the Three Estates, is borrowed from Albert Chastellain (perduif), sometimes of which are appropriated outright. Other passages are borrowings from Octavien de Saint Galais and Sir David Lyndsay. There are strong arguments against Robert Webberburn's authorship, as maintained by Luing and others. It is not likely that he would write in support of Cardinal Beaton's policy, and the dialect is an exaggerated form of Latinized Middle Scots, differing materially from the language of the Compendious Book. Some of the orthographical and typographical peculiarities are due to the fact that the book was set up by Parisian printers. Sir J. A. H. Murray inclines to assign it to Sir James Inglis, or an unknown priest of the name of Wedderburn.

The text of the Complaynt was first edited by Leyden in 1601. Murray's edition for the E.E.T.S. appeared in 1872. The introduction to the latter requires revision in the light of later discoveries as to the plagiarisms in the text. See the paper by W. A. Neilson in The Journal of Germanic Philology (iv.), the note by W. A. Craigie in The Modern Quarterly of Language and Literature (i. 267), Gregory Smith's Specimens of Middle Scots (1902), p. 135 et seq., and the article by J. T. T. Brown in the Scottish Historical Review (January 1904).

WEDDING, the common term for the marriage ceremony. The verb "to wed" is properly to engage by a pledge (O. Eng. wéa, a pledge, wager; cf. Lat. vés, sétis; M. Dutch wéde, pledge, pawn; see Wedgwood, wédlock). The term "wedge" is from Eng. wédge, from Lat. vésca, a gift), used of the state of marriage, or the vows and sacrament of marriage, properly means a gift given as a pledge; cf. Ger. Wertung, the gift to the bride on the morning after the marriage.

See Marriage and Family.

WEDGE (O. Eng. wége, a mass of metal, cognate with Dutch wége, wégge, Dan. væge, &c.; in Lith. the cognate form outside Tout. is found in vågis, a peg, spigot; there is no connexion with "wedge" (vésca) which must be referred to the root weg, to lift, carry, draw, cf. Lat. vehere, whence "vehicle," &c.), a piece of wood or metal, broad and thick at one end, and inclined to a thin edge or point at the other, used as a means for splitting wood, rocks, &c., of keeping two closely pressing surfaces apart, or generally for exerting pressure in a confined space. The "wedge" has sometimes been classed as one of the simple mechanical powers, but it is properly only an application of the inclined plane.

In meteorology, the term "wedge" is used of a narrow area of high pressure lying between two adjacent cyclonic systems, which take the form of a wedge or tongue, as do the isolars representing it on a weather-chart. A wedge moves along between the rear of a retreating cyclone and the front of one advancing, and may be regarded as a projection from an anticyclonic system lying to one side of the course of the cyclones. As the crest of the wedge (i.e., the line of highest pressure) passes over any point the wind there changes suddenly from one direction almost to the opposite, while the clearing weather of the retreating cyclone and the temporary fine weather after its passing are quickly succeeded by a break indicating the approach of the following cyclone. Conditions exactly opposite to those accompanying a wedge are provided by a "V-shaped depression."

WEDGWOOD, JOSIAH (1730-1795), the most distinguished of English manufacturers of pottery, came of a family many members of which had been established as potters in Staffordshire throughout the 17th century and had played a notable part in the development of the infant industry. Dr Thomas Wedgwood of Burslem was one of the best of the early salt-glaze potters. Josiah, born in 1730, was the youngest child of another Thomas Wedgwood, who owned a small but thriving potworks. At a very early age he distinguished himself by keen powers of observation, and interest in all that was curious and beautiful. Soon after the death of his father in 1739, Josiah, then scarcely ten years of age, was taken from school and set to learn the art of "throwing" clay, i.e., shaping pottery vessels on the thrower's wheel, at which he soon became extraordinarily skilful.

In 1744 he was apprenticed to his eldest brother, who had succeeded to the management of his father's pottery; and in 1752, shortly after the term of his apprenticeship had expired, he became manager of a small pottery at Stoke-upon-Trent, known as Elder's pottery, at a very moderate salary. Within a year or two he became junior partner with Thomas Whieldon of Fenton, then the cleverest master-potter in Staffordshire. Many of Whieldon's apprentices afterwards became noted potters, and there can be little doubt that Wedgwood gained greatly at this period of his life by his association with Whieldon. But he was too original to remain long content with a subordinate position, and the pottery business was developing so rapidly that he had every inducement to commence work on his own account.

In 1759 he leased the Ivy House pottery in Burslem from some relatives, and like a sensible man he continued to make only such pottery as was being made at the period by his fellow-manufacturers. Salt-glaze and green and yellow glaze seem to have been his first staples. In 1762 he also leased the Brick-House, alias "Bell" works, at Burslem. The fine white English earthenware was just reaching perfection, and Wedgwood was soon one of its best-known makers. He was most active and energetic in his efforts, not only for the improvement of Staffordshire pottery, but also for the development of a new kind of canal (the Trent & Mersey) and the founding of schools and chapels. Almost the first step in his public career outside his native district was the presentation of a service of his improved cream-coloured earthenware to Queen Charlotte in 1762. The new ware was greatly appreciated, and Wedgwood was appointed potter to the queen and afterwards to the king. He gave the name of Queen's Ware to his productions of this class, and this judicious royal patronage secured him a most deserving manufacturer undoubtedly helped Wedgwood greatly. Having laid the foundations of a successful business in his admirable domestic pottery—ever the best the world had ever seen up to that time—he turned his attention to artistic pottery, and the European renaissance of classic art—fostered by the discovery of Pompeii and the recovery of Greek painted vases from the ancient graves in Campania and other parts of Italy—being at its height it was natural that Wedgwood should turn to such a source of inspiration. Although every European country was affected by this neo-classical revival it may be claimed that England absorbed it more completely than any other country, for the brothers Adam (the architects) and Josiah Wedgwood brought it into absolute correspondence with modern life and ideas. Wedgwood was particularly successful in this direction, for his "dry" bodies—some of which, like the black and cane bodies, had long been known in the district, others, such as the famous Jasper bodies, which he invented after years of laborious effort—lent themselves particularly well to the reproduction of designs based on the later phases of Greek art. If our increased appreciation and knowledge of Greek and Roman art makes us at times impatient with the mechanical perfection of the works of Wedgwood and his contemporaries, the fault is even more the fault of a nation and a period than that of any individual, however com-

It will always remain a matter to Wedgwood's credit that he was the most successful and original potter the world has ever seen—the only one, through all the centuries, of whom it can be truthfully said that the whole subsequent course of pottery manufacture has been influenced by his skill.

Of the externals of his life a few facts will suffice. He married his cousin, Sarah Wedgwood, in 1764, and they had a numerous family of sons and daughters. One of these daughters was the mother of the famous naturalist Charles Darwin. Some time after his marriage (viz. 1768) he entered into a partnership with Thomas Bentley of Liverpool, a man of considerable taste and culture. Bentley, who was a handsome, courtly man, attended largely to the London sales. In 1769 they opened splendid new works, near Hanley, that with their classic leanings they christened "Etruria." They continued a practice of Wedgwood's in employing able artists to produce designs, and the most famous of these was John Flaxman, whose name will for ever be associated with the firm's productions. Bentley died in 1780 and Wedgwood
remained sole owner of the Etruria works until 1790, when he took some of his sons and a nephew, named Byerley, into partnership. He died on the 3rd of January 1795, rich in honours and in friends, for besides being a great potter he was a man of high moral worth, and was associated with many noted men of his time, amongst whom should be mentioned Sir Joseph Banks, Joseph Priestley and Erasmus Darwin. His descendants have carried on the business at Etruria to this day, and have lately established at the works a Wedgwood museum of great interest.

John Quincy Adams ticket, serving for a single session (1825). Two years later, during the excitement over the disappearance of William Morgan (see Anti-Masonic Party), he retired from the Telegraph and threw himself with enthusiasm into the attack on the Masonic order, editing for a time the Anti-Masonic Enquirer. In 1830 he established and became editor of the Albany Evening Journal, which he controlled for thirty-five years. Supporting the Whigs and later the Republicans, it was one of the most influential anti-slavery papers in the north-east; and Thurlow Weed himself became a considerable force in politics. In 1863 he retired from the Journal and settled in New York City. In 1867 he assumed editorial control of the Commercial Advertiser, but was soon compelled to resign on account of ill-health. He died in New York City on the 22nd of November 1882.

*See The Life of Thurlow Weed (vol. i., Autobiography, edited by his daughter, Harriet Weed Weeks, 1883), and Memoir, by his grandson, Thurlow Weed Barnes, Boston and New York, 1884. The Memoir is especially full for the period 1850-1867.*

**WEEHAWKEN,** a township of Hudson county, New Jersey, U.S.A., in the N.E. part of the state, on the Hudson river, adjoining Hoboken and opposite the city of New York. Pop. (1890) 1943; (1900) 5325; (1910 census), 11,228. It is served by the New York, Ontario & Western, and the West Shore railways (being a terminus of the latter), and by suburban electric railways, and by ferries. The township consists of a narrow strip of land along the western bank of the Hudson, and at the southern extremity of the Palisades. The extensive water-front is lined with wharves, some of which can accommodate the largest ocean steamers. On a ledge below the crest of the Palisades is the famous dwelling ground, where New York citizens and others once settled their quarrels. Originally a part of Hoboken and North Bergen, the township of Weehawken was separately incorporated in 1859. Its name is an Indian word said to mean "maize land." (From A.S. weic, German *wicum* probably = change, turn), the name given to periods of time, varying in length in different parts of the world, but shorter than a "month." The month may be divided in two ways: a fractional part may be taken (decad or pentad), as in East Africa or Ancient Egypt (moon-week, or the week may be settled without regard to the length of the month (market-week, &c.). The seven-day week (see Calendar) originated in West Asia, spread to Europe and later to North Africa (Mahomedan). In other parts of Africa three, four (especially in the Congo), five, six and eight (double week) are found, and always in association with the market; the same applies to the three-day week of the Muyucas (S. America), the four-day week of the Chichas, the five-day week of Persia, Malaysia, Java, Celebes, New Guinea and Mexico; in ancient Scandinavia a five-day period was in use, but markets were probably unknown. That the recurrence of the market determined the length of the week seems clear from the Wajagga custom of naming the days after the markets they visit, as well as from the fact that on the Congo the word for week is the same as the word for market. Among agricultural tribes in Africa of the day of the week, which varies from place to place, is often a rest-day, visiting the market being the only work allowed.

Lasch in Zts. für Sozialwissenschaft, ix. 619 seq., and N.W. Thomas in Journ. Comparat. Legislation, xix. 90 seq., refer to the week in connexion with the market.

**WEEKS, EDWIN LORD** (1849-1903), American artist, was born at Boston, Massachusetts, in 1849. He was a pupil of Léon Bonnat and of J. L. Gréau, at Paris. He made many
vagories to the East, and was distinguished as a painter of oriental scenes. In 1893 he wrote and illustrated a book of travels, From the Black Sea through Persia and India, and two years later he published Episodes of Mountaineering. He died on the 17th of November 1903. He was a member of the Legion of Honour, France, an officer of the Order of St Michael, Germany, and a member of the Secession, Munich.

**WEENIX, JAN BAPTIST** (1621-1692), Dutch painter, the son of a sculptor, was born in Amsterdam, and studied first under Jan Micker, then at Utrecht under A. Bloemaert, and at Amsterdam under Moijkaert, and finally, between 1643 and 1647, in Rome. In that city he acquired a great name and worked for Pope Innocent and Cardinal Pamphilii. He returned to his native country in 1649, in which year he became master of the guild of St Luke at Utrecht, where he died in 1660. He was a very productive and versatile painter, his favourite subjects being landscapes with ruins and large figures, seaports, and, later in life, large still-life pictures of dead game. Now and then he attempted religious scenes, one of these kinds being the “Jacob and Esau” at the Dresden Gallery. At the National Gallery, London, is a “Hunting Scene” by the master, and the Glasgow Gallery has a characteristic painting of ruins. Weenix is represented at most of the important continental galleries, notably at Munich, Vienna, Berlin, Amsterdam, and St Petersburg. His chief pupils were his son Jan, Berchom, and Hooch decon. His son, JAN WEENIX (1630-1719), was born at Amsterdam and was a member of the Utrecht guild of painters in 1664 and 1668. Like his father, he tried almost any kind of subject, but his fame is chiefly due to his paintings of dead game and of hunting scenes. Indeed, many of the pictures of this genre, which were formerly ascribed to the elder Weenix, are now generally considered to be the works of his son, who even at the early age of twenty rivalled, and subsequently surpassed, his father in breadth and handling of richness. At Amsterdam he was frequently employed to decorate private houses with wall-paintings on canvas; and between 1702 and 1712 he was occupied with an important series of large hunting pictures for the Prince Palatine Johann Wilhelm’s castle of Bensberg, near Cologne. Some of these pictures are now at Munich Gallery. He died at Amsterdam in 1719. Many of his best works are to be found in English private collections, though the National Gallery has but a single example, a painting of dead game and a dog. Jan Weenix is well represented at the galleries of Amsterdam, The Hague, Haarlem, Rotterdam, Berlin, and Paris.

**WEEVER, JOHN** (1576-1632), English poet and antiquary, a native of Lancashire, was born in 1576. He was educated at Queens’ College, Cambridge, where he resided for about four years from 1594, but he took no degree. In 1599 he published Epigrams in the Oldest Cut and Newest Fashion, containing a sonnet on Shakespeare, and epigrams on Samuel Daniel, Michael Drayton, Ben Jonson, William Warner and Christopher Middleton, all of which are valuable to the literary historian. In 1601 he published The Mirror of Martyrs or The Life and Death of... Sir John Oldcastle, which he calls in his preface the "first true Oldcastle," perhaps on account of the fact that Shakespeare’s Falstaff first appeared as Sir John Oldcastle. In the fourth stanza of this long poem, in which Sir John is his own panegyrist, occurs a reminiscence of Shakespeare’s Julius Caesar which serves to fix the date of the play. After travelling in France, the Low Countries and Italy, Weever settled in Clerkenwell, and made friends among the chief antiquaries of his time. The result of extensive travels in his own country appeared in Ancient Funerall Monuments (1631), now valuable on account of the later obliteration of the inscriptions.

The Huth Library contains a unique copy of a thumb-book Aegus Deltu (1549), containing a history of Christ. The Mirror of Martyrs has been reprinted for the Roxburghe Club (1872).

**WEEVER.** The weevers (Trachinus) are small marine fishes which are common on the coasts of Europe, and which have attained notoriety from the painful and sometimes dangerous wounds they are able to inflict upon those who incautiously handle them. They belong to a family of spiny-rayed fishes (Trachinidae), and are distinguished by a long low body with two dorsal fins, the anterior of which is composed of six or seven spines only, the posterior being long and many-rayed; their anal resembles in form and composition the second dorsal fin. The ventral fins are placed in advance of the pectorals, and consist of two, which are both five in number; the second being the longest. The body is covered with very small scales, sunk in and firmly adherent to the skin, but the upper surface of the head is bony, without integument. The head, like the body, is compressed, with the eyes of moderate size and placed on the side of the head; the mouth is wide, oblique, and armed with bands of very small teeth.

Several species of weevers are known, but two only occur on the British coasts, viz., the Greater Weever (Trachinus draco) and the Lesser Weever (T. vipera); the former is frequently found of a length of 12 in., and possesses some thirty rays in the second dorsal fin, whilst the latter grows only to about half that length, and has about ten rays less in the dorsal. The coloration of both is plain, but the short first dorsal fin is always of a deep black colour. The weevers are bottom fish, burrowing and hiding themselves in the sand or between shingle—the lesser species living close inshore and the greater preferring deeper water, and being found sometimes floating on the surface of the sea, especially at a distance from land. The weevers, though weevers, especially the lesser, are in the habit of burrying themselves in the sand, and are abundant in some localities much more than their batters, and it is not unusual for some weevers to be found more rare than from incautiously handling them after capture. They probably make their escape on perceiving the approach of a person. The wounds are inflicted by the dorsal and opercular spines, which are very painful, and sometimes cause violent local inflammation.

**WEEVIL, Anglo-Saxon widel, a term now commonly applied to the members of a group of Coleoptera termed the Rhyphophora.** This group is characterized by the prolongation of the head into a rostrum or proboscis, at the end of which the mouth, with its appendages, is placed. The antennae are usually elbowed, and often end in a club-shaped swelling. The basal portion of the antennae frequently lies in a depression at the side of the head; this is in contrast with this group, where it is usually on the middle part of the head. The antennae are frequently inserted midway along the rostrum. The mouth appendages are small; the mandibles, however, are stout. The palps are very much conical as a rule. The body is usually small; in shape it varies very much. Theelytra are very hard, and in some cases fused with one another, rendering flight impossible. The larvae are white, fleshy, apodal grubs, with a series of tubercles along each side of the body; the head is round, and bears strong jaws, and sometimes rudimentary ocelli. They are exclusively phytophagous. The Rhyphophora embrace four families,—(1) the Curculionidae, or true weevils; (2) the Scolytidae, or bark-beetles; (3) the Brevitidae; (4) the Anthribidae.

The Curculionidae form one of the largest families amongst the Coleoptera, the number of species described exceeding 26,000, arranged in 1150 genera. The antennae are elongated, and the basal portion inserted in a groove. The third tarsal joint is generally bilobed. Over 400 species exist in Great Britain, few of which exceed half an inch in length. The genera Phyllobius and Polydorus include some of the most beautiful insects found in Britain—their brilliancy, like that of the Lepidoptera, being due to the presence of microscopical scales. The ground colour of some of the species of America, Eutritius imperialis, is another singularly beautiful weevil; its colour is black, studded with spangles of golden green. The included family of Phyllobius, the Curculionidae includes many genera which differ greatly from one another in size, colour, and appearance; even the rostrum, the most striking common characteristic, varies greatly. The form of the body is very various: some are rounded near the coasts and others elongated. Almost linear; some are covered with warty protuberances, whilst others are smooth and shining, often with a metallic luster.

One of the commonest members of this family in Great Britain is the nut weevil, Balanitis nucum. It is of a brownish colour,
varied with yellow, the legs reddish. Its rostrum is unusually long, being five-sixths of the body length in the female, and slightly shorter in the male. The antennae are 7-jointed. The first three joints are much longer than thick; the four following are shorter, and the seventh not longer than thick. The larva is very common in hazed nuts and filberts. When the nuts are about half-grown, the caterpillar bores, with its rostrum, a minute hole in the still comparatively soft nut-shell, and deposits an egg within the nut. The egg is said to be pushed in by means of the long rostrum. As the nut grows the length of the antennae becomes almost obliterated, so that it is unnoticed by all but the most observant eye. The larva is a thick white grub, with a brownish head, bearing fleshy tubercles along its side. It feeds upon the substance of the nut. The nuts which are infested by this insect are usually the first to fall to the ground; the larva then bores a round hole through the nut shell, by means of its jaws, and creeps out. It hides itself in the ground during the winter, and in the spring it passes through the pupa stage, from which it emerges about August as the full-grown insect. A nearly allied form, Balanus glandium, attacks both hazel nuts and acorns.

In an obtrusive way weevils do immense harm to vegetation. This is effected not so much by their numbers and their powers of consumption, as amongst caterpillars, but by their habits of attacking the essential parts of a plant, and causing by their injuries the death of the plant affected. They destroy the young buds, shoots and fruits, and attack the young plants in their most delicate organs. Many of them devour seeds, as the corn weevils, Callais oryzae, and C. oryzae, and in this way vegetation is severely injured, and its spread seriously checked. Others cause much damage in forests, by boring under the bark and through the wood of trees, whilst some even burrow in the tissue of the leaves.

The Brenthidae, Anthribidae and Scolytidae are described in the article Coleoptera. The Scolytidae are often called "weevils," but they have no close affinity with the Rhynchophora, being nearly allied to the Chrysomelidae or leaf beetles. The antennae are straight, and inserted upon the head just in front of the eyes; they are 11-jointed, and serrated on the upper sides corresponding with the saw-like teeth. They have no power of self-defense; during the spring the beetle lays its eggs in the young pea, which is devoured by the larva which hatches out in it.

WEGSCHIEDER, JULIUS AUGUST LUDWIG (1771-1849), German theologian, was born at Kihelingen, Brunswick, on the 17th of September 1771, studied theology at Helmstedt, was tutor in a Hamburg family 1795-1803, Repentant at Göttingen, professor of theology at Rinteln in Hesse (1806-1815), and at Halle from 1815. In 1830 he (with his colleague Wilhelm Gesenius) was threatened with deposition for teaching rationalism, and though he retained his office he lost his influence, which passed to F. A. Thouless and Julius Müller. He died on the 27th of January 1840.

His chief works were Über die von der neuesten Philosophie geforderte Trennung der Moral von der Religion (1804); Einleitung in das Evangelium Johannis (1806); and Institutiones theologicae dogmaticae (1815), to which W. Steiger's Kritik des Rationalismus in Wegscherder's Dogmatik (1830) was a reply.

WEIGHING MACHINES. Mechanical devices for determining weights or comparing the masses of bodies may be classified as (a) equal-armed balances, (b) unequal-armed balances, (c) spring balances and (d) automatic machines. Equal-armed balances may be divided into (1) scale-beams or balances in which the scale-panes are below the beam; (2) counter machines and balances on the same principle, in which the scale-panes are above the beam. Unequal-armed balances may be divided into (1) balances consisting of a single steelyard; (2) balances formed by combinations of unequal-armed levers and steelyards, such as platform machines, weighbridges, &c.

Equal-armed Balances.

Scale-beams are the most accurate balances, and the most generally used. When constructed for purposes of extreme accuracy they will turn with the one-millionth part of the load weighed, though to ensure such a result the knife-edges and their bearings must be extremely hard (either hardened steel or agate) and worked up with great care. The beam must be balanced with a small weight that can be screwed up and down a stem on the top of the beam for the purpose of precisely adjusting the position of the centre of gravity, and there should be a small adjustable weight on a fine screw projecting horizontally from one end of the beam for the purpose of accurately balancing the arms.

The theory of the scale-beam is stated by Weisbach in his Mechanics of Machinery and Engineering, as follows:—In fig. 1 D is the fulcrum of the balance. The weight of the arm is the centre of gravity of the beam, and the lengths of the arms alone. When the weights are equal, &c.

\[
\text{AC} = \text{BC} = \text{EF} = \text{SD} = \text{DF}
\]

The scale is so adjusted that the balance of the horizontal = α, the weight of the beam alone = ω, the weight on one side = ρ, that on the other = P + Z, and lastly the weight of each scale with its appurtenances = Q then

\[
\tan \theta = \frac{PZ + 2Q}{2Q + P - Z + 2\tan \theta}
\]

From this it is inferred that the deviation, and therefore the sensibility, of the balance increases with the length of the beam, and decreases as the distances, a and z, increase; also, that a heavy balance is, ceteris paribus, less sensitive than a light one, and that the sensitive-ness decreases as the distance of the counter-weight increases. In order to increase the sensibility of a balance, the line AB joining the points of suspension and the centre of gravity of the balance must be brought nearer to each other. Finally, if a is made extremely small, so that practically tan θ = ω/2Q, the sensibility is independent of the amount weighed by the balance. Weisbach also shows that, if Gy is the moment of inertia of the beam, the time, t, of a vibration of the balance is

\[
t = \pi \sqrt{\frac{2}{g} \left(\frac{P + Z}{2Q} + \frac{Q}{2Q + P - Z + 2\tan \theta}\right)}
\]

This shows that the time of a vibration increases as P, Q and l, and increase, and a and Z diminish. Therefore with equal weights a balance vibrates more slowly the more sensitive it is, and therefore weighing by a sensitive balance is a slower process than with a less sensitive one.

The conditions which must be fulfilled by a scale-beam in proper adjustment are:—(1) The beam must take up a horizontal position when the weights in the two scale-panes are equal, from nothing to the full weighing capacity of the machine. (2) The beam must take up a definite position of equilibrium for a given small difference of weight in the scale-panes. The sensibility, i.e. the angle of deviation of the beam from the horizontal after it has come to rest, due to a given small difference of weight in the scale-panes, should be such as is suited to the purposes for which the balance is intended. Bearing in mind that with ordinary trade balances there is always a possibility of the scale-panes and chains getting interchanged, these conditions require: (a) That the beam without the scale-panes and chains must be equally balanced and horizontal; (b) that the two scale-panes with their chains must be of equal weight; (c) that the arms of the beam must be equal in length; i.e. the line joining the end knife edges must be exactly bisected by a line drawn perpendicular to it from the fulcrum knife-edge. By testing the beam with the scale-panes attached and equal weights in the pans, and noting carefully the position which it takes up; and then interchanging the scale-panes, &c., and again noting the position which the beam takes up, a correct influence can be drawn as to the causes of failure. Another test for the knife-edges and scale-panes in the direction indicated by the experiment, the operation is repeated, any required degree of accuracy may be obtained by successive approximations. The chief reason for testing the balance in this way is that, if the weights are interchanged with the scale-panes empty, that the balance might be unstable with the weights though stable without them. This is not an infrequent occurrence, and arises from the tendency on the part of manufacturers to make balances so extremely sensitive that they are on the verge of instability.

In fig. 2 let ABCD be the beam of a scale-beam, Z the
fulcrum knife-edge, and X, Y the knife-edges on which the scales are hung. In order to ensure a high degree of sensitiveness, balances are sometimes constructed so that Z is slightly below the line joining X and Y, and is only slightly above it. The centre of gravity of the beam with the scale-pan and chains attached. The addition of weights in the scales will have the effect of lowering the top of the beam, and the balance, becoming unstable, will turn till it is brought up by a stop of some kind.

Fig. 2 represents a precision balance constructed to weigh with great accuracy. The beam is of bronze in a single deep casting, cored out in the middle so as to allow the saddle at the top of the stand to pass through the beam and afford a continuous bearing for the fulcrum knife-edge. The knife-edge and its bearing are both of steel or agate, and the bearing surface is flat. Also are of steel or agate, and have continuous bearing on flat steel or agate surfaces at the upper part of the suspension links. To relieve the knife-edges from wear when the balance is not being used a triangular frame is provided, which is lifted and lowered by a cam action at the bottom, and moves vertically in guides fixed on the stand. By its upward movement the tops of the screw studs near its ends are first received by the projecting studs on each side of the suspension links, and the suspension links are lifted off the end knife-edges; and next, as the sliding frame continues its upward motion, the horizontal studs at the two ends of the beam are received in the forks at the ends of the sliding frame, and by them the fulcrum of the beam is lifted off its bearing. To keep the beam truly in its place, which is very necessary, as all the bearings are flat, the projecting ends of the central piece of steel which forms the fulcrum take bearing on two cheeks of the stand, between which the beam sways. It is clear that errors will arise if the pieces of steel are not truly perpendicular to the plane of the beam, and the adjustment of correct accuracy is shown by the deflection of the beam. With the balances of precision the end knife-edges are fixed on the top of the beam so as to present a continuous unbroken knife-edge, and the fulcrum knife-edge is also fixed in an end, pierced or cut away to admit of the introduction of the stand bearing. With this arrangement the knife-edges can be easily adjusted and examined, and the system is now rapidly extending to all classes of balances.

The knife-edges of weighing machines are the parts that wear out soonest, but very little is known about them experimentally, and the knife-edges made by different makers vary extremely in their resistance to wear. For the scales of delicate machines are made of the hardest materials, and some are constructed so that the delicate machines are formed to an angle of about 80° between the sides, with the finished edge ground to an angle varying from 110° to 120°. The weight of the knife-edges is very great.

In some respects it would appear to be very suitable for weigheedges, in which the machine is very small, but for general commercial reasons the adjustment of the knife-edges is more rigorous. In the comparison of standard weights, or in any weighing operations where great accuracy is required, it is necessary to use many precautions. The comparison of standard weights has to be conducted at the standard temperature, and the room must be brought to that temperature and maintained at it. The balance must be enclosed in a glass case to protect it from draughts of air or from the heat of the body of the operator. The air-escape and shifting the weight must be effected by mechanism which will enable this to be done without opening the case or exposing the machine.

When the weights which are to be compared are of different metals further complications arise, for the volumes of equal weights of different materials will be different, and therefore the quantity of air displaced by them will vary. When the weight is placed on the beam, the volume of air displaced by the two weights must be ascertained. And the weight of air displaced depends upon the density of the air at the time of weighing, and therefore the barometer reading must be taken. For this correction an exact knowledge of the specific weights of the metals under comparison is required. In this way an exact comparison of the weights in troy can be computed, but of course the simplest way of arriving at the result would be by the construction of a standard air-tight case which can be completely exhausted by air by air-pump, and in which the weighing can then be effected in troy. The difficulty about weighing in troy is found that it is impossible to maintain a constant degree of exhaustion, because of the leakage connected with weighing operations, and in consequence weighing in troy is not much in favour. Whatever method is adopted very exact weighing is discussed much rapid work. Counter machines have the advantage over scale-beams in not being encumbered with suspension chains and the beam above. They are usually made with two beams, each with its knife-edge tie to the piece of some distance apart, so that the balance-pan being carried on two knife-edges, is prevented from tipping over sideways. To prevent them from the beam above the pan and shifting, the knife-edge is fixed to the under side of each pan, the lower end of which is loosely secured by a horizontal stay to a pin in the middle of the frame. In using these machines there is seldom any question of placing the pan, as in the case of the beam which is generally of high importance. Hence they are very commonly made unstable, or "accelerating," i.e., they are constructed with the fulcrum knife-edges lower than the beam joining the end knife-edges and are arranged so that the beam is horizontal when the stop of the weights-pan is hard down on its bearings. This arrangement
WEIGHING MACHINES [UNEQUAL-ARMED]

is well adapted for weighing out parcels of goods of a definite weight, though not for ascertaining the correct weight of a given article. For the latter purpose machines are used of which the beams are made stable, or "vibrating," by constructing them with the fulcrum knife-edges above the line joining the end knife-edges. "Accelerating" machines can be used to the advantage of the vendor in two ways. Firstly, in using them to determine the weight of a given article. For with unstable balances, although the smallest excess of weight in the goods-pan will cause it to descend till it is brought up by its stop, yet being in this position, a very much greater weight than the difference which brought it there will be required in the weights-pan to enable it to mount again. If \( W \) be the weight in each pan when the goods-pan commenced to sink, \( j \) the length of each arm, \( m \) the distance of the fulcrum below the line joining the end knife-edges, and \( \theta \) the angle at the fulcrum which defines the range of sway of the beam, it can easily be shown that \( w \), the additional weight required in the weights-pan to enable the goods-pan to rise from its stop, is given by the equation \( w = W \frac{m}{L} \tan \theta \). So that if, for example, a fishmonger uses such a machine to ascertain the weight of a piece of fish which he places in the goods-pan, and thereby depresses it down upon its stop, and then places weights in the weights-pan till the goods-pan rises, the customer is charged for more than the real weight of the fish. Secondly, in using them out of level, with the goods end of the machine lower than the weights end. If \( \theta \) be the angle of tilt of the machine, and the other symbols be as before, it may be shown that the additional weight, \( w \) on the pan, as at D or E. Using the symbols of the diagram, it can be shown that the effect of placing the weight \( W \) at E instead of F is to cause the end of the beam to descend, as if under the action of an additional weight, \( w \), at \( F \) such that

\[
w = W \frac{m}{L} \tan \theta \tan \theta.
\]

The condition that must exist in order that the balance may weigh correctly for all positions of the weight \( W \) is \( w = a \), or \( \tan \theta = -\frac{m}{a} \); that is, the stay KG must be adjusted parallel to the line joining the points A and C. From the equation for \( w \), it is seen that the larger \( h \) is the smaller \( w \) will be. Therefore for the larger counter machines, where it is not convenient to have the scale-pan raised high above the counter, and for "dead-weight" machines on the other principle, where it is not convenient to have the scale-pan raised high above the floor, there is an advantage in adopting the "inverted counter machine arrangement (fig. 5), because the vertical axis can be produced up upon the machine. This arrangement is very common. As will be readily understood from the construction of the machines, there is more friction in counter machines than in scale-beams. The "sensitiveness" error allowed by the Board of Trade for counter machines is five times as great as that allowed for scale-beams.

The torsion balance made by the United States Torsion Balance and Scale Company of New York is a counter machine made without knife-edges, and is very sensitive. It is constructed with two similar beams, one above the other, which are coupled together at the ends to form a parallel motion for carrying the pans up right. The coupling is effected by firmly clamping the ends of the beams upon the top and bottom respectively of a loop of watch-spring, which is tightly stretched round the casting carrying the pan, as is shown in the end view in fig. 6. At their middles the beams are similarly clamped upon the bottom of a loop of watch-spring which is tightly stretched round a casting which is bolted upon the bed-plate. When the case which holds the machine is adjusted horizontally by means of its foot-screws, and the weights in the pans are equal, the beams remain perfectly horizontal; but with the slightest difference of weight in the pans the beams are tilted, and the elastic resistance of the springs to torsion allows the beams to take up a definite position of equilibrium. The lower beam carries on a saddle a scale which is raised nearly to the top of the glass case in which the machine is enclosed, and as the beams sway this scale plays past a scratch on the glass, which is so placed that when the zero point on the scale coincides with the scratch the beams are horizontal. With proper care this machine should be very permanent in its action.

Unequal-armed Balances.

Steelyards are simple, trustworthy and durable, but unless special contrivances are introduced for ascertaining the position of the travelling poise with very great accuracy, there will be a little uncertainty as to the reading, and therefore steelyards are not in general so accurate as scale-beams. When carefully nickel-plated or well-varnished for weighing out definite quantities of goods, such as 1 lb, 2 lb, &c., as in such cases there is no question of estimation. The ordinary way of using a steelyard is to bring it into a horizontal position by means of movable weights, and to infer the amount of the load from the positions of these. But it is sometimes convenient to use a fixed weight on the long arm, and to infer the amount of the load from the position of the steelyard. The rule for graduation is very simple. The simplest form is that which has a single travelling poise. The more elaborate ones are made either with a heavy travelling poise, or with the bulk of the load enclosed, or with a fixed poise, or else with a knife-edge at the end of the steelyard, on which loose weights are hung to measure the bulk of the load, the remainder being measured with a light travelling poise. The advantage of the first arrangement is that the weights on the steelyard are always the same, and inconsistencies of indication are avoided, while in the second arrangement the loose weights are lighter and handier, though they must be very accurate and consistent among themselves, or the error will be considerable, by reason of the great leverage they exert.

Steelyards, like other weighing machines, will be "accelerating," or "vibrating," according to the arrangement of the knife-edges.
UNEQUAL-ARMED WEIGHING MACHINES

In fig. 7 let Z be the fulcrum knife-edge, X the knife-edge on which the load R is hung, and H the centre of gravity of the weights to the right of Z, viz., the weight, W, of the steelyard and the contents of the box of gravity; G, the travelling poise; P, acting at M; and the weights, Q, hung on the knife-edge at Y. Then if Z be below the line joining X and H, the steelyard will be "accelerating," i.e., with the smallest excess of moment on the right-hand side of the fulcrum, the end C of the steelyard will rise with accelerating velocity till it is brought up by a stop of some sort; and with the smallest excess of moment on the left-hand side of the fulcrum, the end C will drop, and will descend with accelerating velocity till it is brought up by a similar stop. If Z be above the line XH, the steelyard is "vibrating," i.e., it will sway or vibrate up and down, ultimately coming to rest in its position of equilibrium. STEELEYARDS are frequently arranged as counter machines, having a scoop or pan resting on a pair of knife-edges at the short end, which is prevented from tipping over by a stay arrangement similar to that of other counter machines.

Steeleyards are largely used in machines for the automatic weighing out of granular substances. The principle is as follows: The weighing is effected by a steelyard with a sliding poise which is set to weigh a definite weight of the material. A packet of the material rests on the knife-edges at the short end, and is kept from tipping over by stays. A packet is placed on the pan to receive the material from the slot of a hopper. A rod, connected at its lower end with the steelyard, carries at its upper end a horizontal double knife-edge which cuts off the flow from the slot when the steelyard kicks. When the filled packet is removed, the steelyard resumes its original position, and the filling goes on automatically.

The automatic personal weighing machine found at most railway stations operates by means of a steelyard carrying a fixed weight on its long arm, the load on the platform being inferred from the position of the steelyard. In fig. 8 the weight on the platform is transferred by levers to the vertical steel band, A, which is wrapped round an arbor on the axis of the disk-wheel, B, to which is rigidly attached the toothed segment, C. The weight, D, is rigidly attached to the axe of the wheel, B, and the counterbalance, E, is in equilibrium with the wheel, B, by means of a cord wrapped round it. When the pull of the band, A, comes upon the wheel, B, it revolves through a certain angle in the direction of the arrow until each of the three forces, viz., the pull of A, the weight, D, and the counterbalance, E, are in equilibrium. The toothed segment, C, actuates the pinion, F, which carries the finger, G, and this finger remains in position so long as the person is standing on the platform. If now a small weight, as a penny, be passed through the slot, H, it falls into the small box, I, and causes the lever, J, to turn; the lever, J, which turns in friction wheels at K, and is counterbalanced at O, carries a toothed segment, L, which actuates a small pinion on the same axle as F, and is free to turn on that axle by a sleeve. This small pinion actuates a finger, M, which is arranged to catch against the finger, G, when moved up to it. Consequently as the lever, J, turns, the finger, M, revolves, and is stopped when it reaches G. The finger, G, which carries M also carries the dial finger, and if the dial is properly graduated its finger will indicate the weight. The box, I, has a hinged bottom with a projecting click finger which, as the box descends, plays idly over the staves of a ladder arc. When the weight is removed from the platform, the counterbalance, E, causes the finger, G, to run back to its zero position, carrying with it the finger, M, and causing the click finger of the box, I, to trip open the bottom of the box and let the penny fall out. This lever, J, to which the above described counter is attached, is set to zero position, and all is ready for another weighing. Since so small a weight as a penny has to move the lever, J, together with the dial to zero position, and the friction kept very low by means of friction wheels.

Some of the largest and most accurate steelyards are those made for testing machines for tearing and crushing samples of metals and other materials. They are hung on a weight 1 ton, which has a run of 200 in., and the steelyard can exert a pull of 100 tons.

Balances are frequently used as counting machines, when the articles counted are all of the same weight or nearly so, and this method is both quick and accurate. They are also used as trade computing machines, as in the case of the machine made by the Computing Scale Company, Ltd., in Dayton, Ohio. In this machine the goods to be priced are placed on the platform of a small platform machine whose steelyard is adjusted to balance exactly the weight of the platform, levers and connections. The rod which transmits the pull of the long body lever of the platform machine to the knife-edge at the end of the short arm of the steelyard is continued upwards, and by a simple mechanical arrangement transmits to an upper steelyard any additional pull of the long body lever due to the weight of goods placed on the platform. This upper steelyard is arranged as in fig. 9, where A is the point where the pull of the long body lever due to the weight of the goods on the platform comes upon the lever B; C is the moving steelyard, which with the steelyard can be slid to and fro on the frame of the machine; and Q is a poise which can be slid along the upper bar of the steelyard. The steelyard is exactly in balance when there is no weight on the platform and Q is at the zero end of its run, at O. Suppose that the weight of the goods on the platform is (p) lb, and that 1/4th of this weight is transmitted by the long body lever to the point A, so that 1/4 lb is the pull at A. Let the lower bar of the steelyard be graduated in equal divisions of length, d, each of which represents one penny, so that the distance CA = qX d represents q pence. Then the number pX d represents the total value of the goods on the platform. If Q is the weight of the poise Q, the position of Q when the steelyard is exactly in balance is given by the equation 1/2gX d = QXOQ, or Q = pX dX OQ. If the upper bar is graduated in divisions, each of which is 1/4 Q, the indication of the poise Q, viz., pX d graduations, gives correctly the value of the goods. Thus to ascertain the value of goods on the platform of unknown weight at a given price per lb, it is only necessary to slide the steelyard till the weight acts at a division which represents the price per lb, and read it off. The poise Q, the indication of the poise Q, viz., pX d graduations, gives correctly the value of the goods. Thus to ascertain the value of goods on the platform of unknown weight at a given price per lb, it is only necessary to slide the steelyard till the weight acts at a division which represents the price per lb, and read it off. The poise Q, the indication of the poise Q, viz., pX d graduations, gives correctly the value of the goods. Thus to ascertain the value of goods on the platform of unknown weight at a given price per lb, it is only necessary to slide the steelyard till the weight acts at a division which represents the price per lb, and read it off. The poise Q, the indication of the poise Q, viz., pX d graduations, gives correctly the value of the goods. Thus to ascertain the value of goods on the platform of unknown weight at a given price per lb, it is only necessary to slide the steelyard till the weight acts at a division which represents the price per lb, and read it off. The poise Q, the indication of the poise Q, viz., pX d graduations, gives correctly the value of the goods. Thus to ascertain the value of goods on the platform of unknown weight at a given price per lb, it is only necessary to slide the steelyard till the weight acts at a division which represents the price per lb, and read it off. The poise Q, the indication of the poise Q, viz., pX d graduations, gives correctly the value of the goods.

In the machines commonly used to weigh loads exceeding 2 cwt, the power is applied at the end of the long arm of the steelyard and transmitted by levers from 100 to 500 times, so that the weights used are small and handy. The load is received upon four knife-edges, so that on the average each knife-edge receives only one-fourth of the load, and, as will be seen, it is immaterial whether the load is received equally by the four knife-edges or not, which is essential to the useful application of these machines.

In fig. 10 AB is the steelyard. The platform and the load upon it are carried on four knife-edges, two of which, x1, x2, are set to the steelyard by the two levers shown, the upper one CD being known as the "long body," and the lower one EF as the "short body." If x1 = x2, and x1 = x2, then the platform and the load applied at x1 will be the same as the leverage of any part of the load supplied at x1, and the pressure produced at x1 will be the same for equal portions of the load, whether they were originally applied at x1 or x2. Platform machines, like this, may be arranged either on the "accelerating" principle or on the "vibrating" principle. If in fig. 10 p be the centre of
WEIGHING MACHINES

gravity of the long body CD, and \( h \) be the centre of gravity of the three vertical forces acting downwards at the points \( x_1 \), \( i \) and \( n \), considered as weights collected at those points; then if \( h \) be above the line \( 2y_3 \) it can be shown that this arrangement of the knife-edges of CD favours the "acceleration" principle, and is suited to act with and assist an "accelerating" steelyard, and similarly if the point \( h \) be above the line \( 2y_3 \) in the case of the short body EF. If the knife-edges be placed so that \( h_1 \) and \( h_2 \) are below the lines \( 2y_3 \) and \( 2y_3 \) respectively, the arrangement will favour the "vibration" principle, and is suited to act with and assist a "vibrating" steelyard.

It is very important that platform machines should be truly level. With accelerating machines a small amount of tilt in any direction considerably affects the accuracy of the weighing, and when the amount of tilt is considerable the action may be changed, so that a machine which was intended to act as an accelerating machine acts like a vibrating one. Vibrating machines are only slightly affected by being out of level in comparison with accelerating machines, and in this matter they have a distinct advantage. When a platform machine is in true adjustment, and the loose weights which are intended to be hung at the end of the steelyard are correct and consistent among themselves, a good and new machine, whose capacity is 4 cwt., should not show a greater error than 4 oz. when fully loaded. Platform machines are slightly affected by changes of temperature. In some cases they are made "self-recording" by the following arrangement: The steelyard is provided with a large and a small travelling poise. Each of these poises carries a horizontal strip of metal, which is graduated and marked with raised figures corresponding to those on the steelyard itself. These strips pass under a strong punching lever arranged on the frame of the machine. A card prepared for the purpose is introduced through a slit in the frame between the punch and the strips. When the poises have been adjusted to weigh a load on the platform the punch is operated by a strong pull, and the impression of the raised figures is left on the card. Thus the weight is recorded without reading the positions of the poises. In another arrangement the self-recording parts are entirely enclosed in the travelling poise itself.

Fig. 11 shows the ordinary arrangement of the parts of a platform machine, but there are many types which differ greatly in detail though not in principle.

When the goods to be weighed are very heavy, portable weighbridges or platform machines are inapplicable and it is necessary to erect the weighbridge on a solid foundation. Some weighbridges are arranged in a manner similar to that of the platform machines already described, but having the long body lever turned askew, so that the end of it projects considerably beyond the side of the weighbridge casing, and the pillar and steelyard which receive its pull are clear of the wagon or the platform. In another arrangement two similar triangular levers take bearing on opposite sides of an intermediate lever which communicates their pressures to the steelyard; this is a very sound and simple arrangement for ordinary long weighbridges. Lastly, when the weighbridge is very long—and they are sometimes made 40 ft. long—and are arranged to weigh up to 100 tons or more—it is practically composed of two platform machines end to end, each having its four knife-edges to receive the load, and the two long bodies take bearing on the opposite sides of an intermediate horizontal lever, the end of which is connected with the steelyard. When skillfully made they are very accurate and durable.

A useful application of weighbridges is to ascertain the exact weights on the separate wheels of locomotive engines, so that they may be properly adjusted. For this purpose a number of separate weighbridges of simple construction are erected, one for each wheel of the engine, with their running surfaces in exactly the same horizontal plane. The engine is moved on them, and the pressures of all the wheels are taken simultaneously, each by its own weighbridge.

There are many kinds of weighing machines depending for their action on combinations of levers, and arranged to meet special requirements. Such are coal platform machines for weighing out coal in sacks, the levers of which are arranged as in the ordinary platform machines, but for the sake of compactness the steelyard is returned back over the long body, and when loaded with the proper weight indicates the correct weight of the coal in the sack by its end kicking up. Crane machines are used to weigh goods as they are hoisted by a crane; the lever arrangement is shown in fig. 12. A crane machine of peculiar construction, well adapted for weighing heavy loads, and extremely simple and compact, which does not properly come under any of the heads under which the machines have been classified, is the hydrostatic weighing machine. This machine is constructed with an open top cylinder, a stirrup strap being provided by which it may be suspended from a crane.

cylinder, which is filled with oil or other liquid, is fitted with a piston having a piston-rod passing downwards and terminating in an attachment for the goods to be weighed. As the goods are lifted by the crane the whole of their weight is taken by the liquid in the

FIG. 12.

cylinder, and the pressure on the liquid, as indicated by a pressure gauge, gives the weight. The gauge has a plain dial, marked off by indications given by the application of standard tons and cwt.; it could probably be read to about 1% of the load weighed.

Spring Balances.

For many purposes spring balances are the most convenient of all weighing machines. They are rapid in action, the indication is in general clear, and there is no need of loose weights except for testing the machine occasionally. Their action depends upon the extension of one or more spiral springs, and as the extension is proportionate to the weight which causes it the graduation is very simple. The accuracy of spring machines depends upon the accuracy of the springs and the workmanship of the machines. The springs in general are very accurate and uniform in their extension, and are very permanent when fairly well used; but their indications are apt to vary from fatigue of the springs if they are kept extended for a weight for a long time. Their indications also vary with the temperature, so that for good work it is advisable that spring balances should be frequently checked with standard weights. For the sake of compactness and convenience of reading the extension of the springs, and consequently the load, is frequently indicated on a dial, by means of a small rack and pinion, which give motion to a finger on the dial-plate, but the regularity and correctness of the indications of the finger will depend upon the condition of the rackwork and upon the friction, and these will vary with the wear of the machine. For the above reasons spring balances are not in general so accurate as knife-edge machines. It is found that when a spiral spring is extended by a weight it has a tendency to turn a little round its axis. Therefore an index pointer attached to the bottom of the spring, and moving past a scale would rub slightly against the case. To correct this tendency the spring is usually made half with right-hand spiral and half with left-hand spiral.

The extension of a spiral spring is given by the formula:

\[ \text{Extension} = W \times R \times \frac{E}{12E_s} \]

in which \( W \) = weight causing extension, in lbs; \( n \) = number of coils; \( R \) = radius of spring, from centre of coil to centre of wire, in inches; \( r \) = radius of wire of which the spring is made, in inches; \( E \) = coefficient of elasticity of wire, in lbs per square inch. The value of \( E \) depends upon the tempering of the wire and will vary accordingly: for the springs of trade balances \( E \) will usually be about 10,500,000. For the application of the above formula it is necessary to measure \( R \) and \( r \) very accurately, by reason of the high powers involved, but when this has been carefully done the formula may be relied upon. Thus in the case of a spring for which the values of the quantities were \( W = 7 \) lb, \( n = 51 \), \( R = 0.30 \) in., \( r = 0.018 \) in., \( E = 10,500,000 \), the formula gives extension \( = 1.764 \) in., while direct experiment gave extension \( = 1.75 \) in. And with a very long and weak spring for which the values of the quantities were \( W = 1 \) oz., \( n = 233 \), \( R = 0.33 \) in., \( r = 0.0085 \) in., \( E = 10,500,000 \), the formula gives extension \( = 22.78 \) in., while direct experiment with the spring gave \( 23.5 \) in.

Automatic Weighing Machines.

During the last few years great efforts have been made to expedite the operation of weighing machines by the introduction of machinery, more or less complicated, which renders the machines to a great extent self-acting. The object aimed at varies very much with different machines. Sometimes the object is to weigh out parcels of goods in great numbers of the same definite weight. Sometimes the object is to weigh out parcels of goods, of unknown weight, as in ordinary retail dealing, and to give the exact value of each parcel at different rates per lb. Sometimes the object is to weigh loads in successive intervals of time, or the loads being of varying weight, and to record the total weight at the end of a day's work; this is the case with machines for weighing coal and other minerals. Of course the introduction of automatic mechanism introduces friction and other complications, and it is difficult to construct automatic machines that shall be as accurate in their weighing as the simpler weighing machines, but in many weighing operations a moderate degree of accuracy will suffice, and speed is of great importance. It is to meet such cases that the greater number of automatic weighing machines have been invented. Some examples of these machines will now be given.

Automatic Computing Spring Weighing Machine for Retail Purposes (fig. 14). A weight and centrally balanced drum with its axis horizontal is enclosed within a cylindrical casing, and rotates freely in bearings formed in the ends of the casing. The casing is fixed in supports on the top of a strong frame, which also carries a small platform machine such as is shown in fig. 13. The drum is in position, and the goods to be weighed are placed on it. The pull of the load is transmitted to a hook which hangs freely from the middle of a horizontal bar below the drum casing. At each end of the drum casing is attached a vertical spiral spring. The movement of the drum is transmitted by the extension of these springs to the weighing of the goods placed on the drum. These have two vertical racks, one at each end of the casing, in connexion with two spirals, and the drum has attached upon these actuating pins on the axle of the drum and cause it to revolve as the springs extend. The horizontal bar which receives the pull of the load is connected at its ends with two spiral springs and pulls vertically upon them. Above the horizontal bar, and parallel with it, is a rod which is connected at its ends with the lower ends of the vertical racks, and at its middle with the horizontal bar. The connexion with the horizontal bar is through the medium of an adjustable cam. This cam can be turned by hand in a vertical plane by means of a worm and wheel movement, and by turning the worm the vertical distance between the bar which is attached to the springs and the rod which is attached to the racks can be increased or diminished, and thus the racks can be moved relatively to the springs. By this means the zero of the scale on the drum can be restored to the first division on the index when there are no goods on the platform. There is also a compensation arrangement for effecting automatically the same adjustment for changes of temperature. To deaden the vibration of the springs after a load has been removed on the platform, and thus to enable the weights and the values of the goods to be read rapidly, the piston of a glycerine cylinder is attached to the end of the lever which pulls upon the hook of the horizontal bar and is worked by it in the glycerin.
WEIGHING MACHINES

Automatic Computing Weighing Machine for Retail Purposes (Fig. 14).—The action of the machine shown in Fig. 14 depends upon the displacement of a loaded pendulum. The machine is arranged to weigh goods up to 8 lb with the fixed weight only on the pendulum, and up to 16 lb with an additional weight which can be readily slipped on to the pendulum rod. The weights and money values are arranged on a vertical chart, the sides of which converge towards the pivoting centre of an index arm which is actuated by the weighing mechanism. The two outer arcs of the chart are occupied by the scales for the weight of the goods in lb and oz., and the rest of the chart is occupied by a series of 25 concentric arcs which show the money values of the goods for 25 rates per lb. The rates per lb are inscribed on the index arm at points corresponding to the values on the concentric arcs of the chart, and the values are indicated on the chart by the toothed edge of the index arm. On the customer's side of the machine the weight of the goods is indicated on a pair of arcs by a separate index arm precisely in the same manner as on the seller's side.

In weighing, the goods are placed in the pan of an ordinary lever machine (see Fig. 14), and the end of the lever rests on the stirrup end of a short vertical rod. The upper end of this rod is formed into a loop, and this loop pulls upon a knife-edge which is fixed to a short lateral arm rigidly attached to a vertical disk, and this disk turns in bearings formed in the frame of the machine. The same disk carries the index arm, which is rigidly fixed to it and indicates the weight and value of the goods, and also carries the pendulum, which is rigidly attached to it, and regulates the position of the index arm according to the position which it takes up when it is actuated by the lever of the lever machine. This lever is so counterbalanced that when there is no weight in the pan the pendulum is vertical, and the index arm should then stand at zero. The zero adjustment is effected by means of levelling screws in the base of the frame. In order to deaden the vibrations of the index arm when weighing goods a vertical rod is attached to the lever from the lever machine near its left-hand end, and this rod carries on its lower end a plunger which works in a closed cylindrical dash-pot containing oil or glycerin.

Automatic Computing Weighing Machine (even balance and pendulum) for Retail Purposes (fig. 15).—This is an equal-armed inverted counter machine (see fig. 5) arranged to weigh up to 14 lb with great accuracy. Up to 2 lb the weight of the load is registered automatically on the chart in much the same manner as in the case of the automatic computing weighing machine already described. When the load exceeds 2 lb one or more 2-lb weights are placed in the weights-pan, and the value of the goods is computed, the rate per lb, in the ordinary manner; and the value of the balance of the goods is read off the chart, and the two are added together.

The advantage of this is that a very open scale is obtained for reading the value of the balance of the load. Thus, for weighing up to the full load of 14 lb, six 2-lb weights are required and no others.

The manner in which the balance of the load is weighed is as follows: Near the bottom of the vertical leg from the goods-pan a projecting piece is rigidly attached to it, and as the pan descends with the balance of the load this piece pulls by a hook on a thin band of steel, which is led upwards and wraps round the surface of a disk to which it is firmly secured. This disk rotates by rocking on a pair of knife-edges whose bearings are rigidly attached to the frame. The disk carries a weighted brass cylinder rigidly attached to it, which is pulled into an oblique position by the steel band until equilibrium is established. And the disk also carries the index arm which plays past the vertical face of the chart, and indicates the weight and price up to 2-lb weight. The disk also carries a second and corresponding index arm which indicates the weight on the purchaser's side of the machine. At the bottom of the vertical leg from the goods-pan a projecting piece which is attached to the top of a vertical piston rod, the piston of which plays in a dash-pot of glycerin as the beam sways, and deadens the vibrations of the index arm.

Automatic Tea Weighing Machine (fig. 16).—This machine is designed to weigh out tea in quantities of 1/2 lb each, which are done up in separate packets by hand. A large number of movements are involved in the working of this machine, and the layout is such as to demand the most accurate balance and alignment of all parts.
have to be provided for, and the machinery is complicated, so that a general description of the action of the machine is all that will be here given.

The tea is fed into a hopper, which has a large opening at the bottom, and this opening is entirely closed by two cylindrical brushes, which are mounted end to end on a horizontal shaft. As they revolve these brushes engage the tea in the hopper, draw it out by degrees, and drop it into a compartment of a circular drum which hangs on one end of a scale-beam. The brushes have the same diameter, but one is much longer than the other, and they move independently of one another. For the bulk of the filling both brushes are in operation, but when the load is nearly complete the longer brush is stopped and the filling is completed by the shorter brush only. When the load is complete the shorter brush also is stopped while the compartment of the drum is emptied. And the action is then renewed. All these operations are effected automatically.

The circular drum is divided into four equal compartments by radial diaphragms. And in a pan at the other end of the beam (which is counterbalanced for the weight of the drum) is a 4-lb weight to weigh the tea. As the uppermost compartment fills, the weights end of the beam rises, and by means of a vertical rod successively operates on detents connected with the rotation of the two brushes, and stops them in turn. And when the short brush is stopped a rod from the shaft frees a spring detent which keeps the drum in position and tips it over. The tea is shot out and falls into a receptacle below, and the drum makes a quarter of a revolution, and is again held in position by the detent with an empty compartment at top ready for the next filling.

The power is applied by a belt round a pulley, which is mounted on the end of the horizontal shaft which carries the brushes. The brushes are carried by sleeves which run loosely on the shaft, and to each sleeve is rigidly fixed a ratchet wheel. Next the ratchet wheel is a disk which is keyed on to the shaft. The ratchet wheel and the disk are automatically connected by clutch mechanism, which holds the disk rigidly connected together and acting as a single beam. A 4-lb weight is placed in the weights-pan of the balance, and is the only house weight used with the machine. The pair of beams are hinged centrally by rods and hooks from knife-edges in the forked end of a strong beam, which is carried at its fulcrum by the top plate of the frame of the machine. This beam is heated counterbalanced at its further extremity. Underneath the top plate of the machine, and strongly framed to it, is a box, which contains the corresponding rods to the ends of which are attached the slides which regulate the flow of sugar from the bottom of the hopper. These rods pass through holes in the front and back plates of the box, and are furnished with spiral springs (the rods are forced back by hand) and are in compression between the back plate of the box and shoulders on the rods. The rods are held in this position by detents which take hold of the shoulders of the rods, and are acted upon from the front end of the upper beam and the weights-pan end of the lower beam respectively, in order to release the rods at proper times and reduce or cut off the flow of sugar from the hopper. The upper slide has the shape of a truncated cone, and it reduces the office of flow so as to render the flow of the sugar more manageable. This holds the bag in a cut-off slide. When it is desired to use the machine, a 4-lb bag is placed under the orifice of the hopper upon the goods-pan of the balance, and the slide rods are thrust back by hand till they are held by their detents, and the sugar flows rapidly into the bag. When the bag is nearly charged to the weight of 4 lb, the weight of the bag of sugar overcomes the resistance of the counterbalance of the upper beam, and its front end drops a certain distance. In dropping it dislodges the detent of the reducing slide, and the slide springs forward and reduces the flow of the sugar. The diminished stream of sugar continues to flow till the 4-lb weight in the goods-pan of the other end of the upper beam being for the time brought up against the frame and unable to descend further), and in lifting it dis-
the 4-lb weight is being lifted. But at the same instant that the cut-off takes place the rider weight is lifted off the end of the balance by a

vertically upon the spring of an ordinary spring balance, which registers the load, and with the addition of suitable counting mechanism sums up the weights of any number of successive loads.

The charges of coal fall into the hopper with a heavy shock, and in order to save the knife-edges there is a strong pin in each side of the hopper below the knife-edge, which, before the charge of coal is dropped into the hopper, is acted on by a strong horizontal flitch-plate, which heaves the hopper off the knife-edges and relieves them from the shock. The heaving-up of the flitch-plate and hopper is effected by a cam on the end of a horizontal shaft which runs along the back of the machine behind the hopper. The flitch-plate rests at one end on the top of this cam, and at the other end is shacked to the horizontal arm of a bell-crank lever which is pivoted on the frame. When a charge of coal is dropped into the hopper, the bell-crank lever receives a violent jerk from the shackles of the flitch-plate, and this jerk by means of suitable mechanical arrangements throws a pinion on the cam shaft into gear with a wheel on a counter-shaft

self-acting arrangement, and the sugar in transitu takes its place in the bag. And, if the rider weight has been correctly adjusted, the bag of sugar will be shown to weigh exactly 4 lb by the beam vibrating in equipoise.

Automatic Coal Weighing Machine (fig. 18).—This machine weighs the coal delivered into factories, &c., by charges up to 20 cwt. at a time, and records and sums up the weights of the charges so as to exhibit the total weight delivered. The whole of this work is effected automatically.

The coal is dropped into a hopper by a grab. The hopper is carried on two knife-edges, one on each side, and is prevented from tipping over fore and aft by a pair of parallel motion bars on each side. The knife-edges on which the hopper rests are on two horizontal levers, one on each side of the hopper. These levers are carried by knife-edge fulcrums in bearings on the frame of the machine, and transmit the weight of the hopper by means of an intermediate lever and a vertical rod to the indicator lever. And the long arm of the indicator lever pulls

which is kept constantly running by means of a belt and pulley driven by an engine. The cam shaft and the cam then begin to revolve, and the flitch-plate is gradually lowered till the knife-edge bearings of the hopper are received on the knife-edges of the main measuring levers, and the load is then weighed by the levers and the spring-balancing. Shortly after this is done the mechanism at the back of the hopper automatically opens the doors at the bottom of the hopper, and the coal drops out. The rotation of the cam shaft continues till the cam has again heaved up the flitch-plate, when the pionton on the cam shaft is thrown out of gear with the wheel on the counter-shaft, and the cam remains steady till another charge of coal is dropped into the hopper and the action is renewed. The coal when dropped out of the hopper runs down a shoot into a receptacle, from whence it is lifted by a Jacob's Ladder and distributed to the boilers, &c., of the factory.

Automatic Coal Weighing Machine (fig. 19).—This machine is designed to weigh and total up the weight of materials passed over it during a considerable course of operations. The trucks or other receptacles containing the coal, &c., are drawn upon the platform of the machine, and the pull of the load is transferred by a vertical rod at the left-hand end of the machine to the knife-edge on the short arm of the steelyard, whose fulcrum is carried on bearings in the frame. Behind the pulley at the top of the machine and on the same shaft is a spur wheel, which drives both of the spur wheels shown in the diagram. The small spur wheel is mounted on the steelyard, and this wheel and the one that drives it are so arranged that their line of
Clutch with a shaft in the same line, on which are keyed a sprocket wheel and a ratchet wheel, the latter being a similar sprocket wheel which is keyed on the same shaft as that of the left-hand pulley. The ratchet wheel is acted upon by the diagram. When the poise is at the zero end, and there is no load on the platform, the end of the steelyard is down, and has locked the ratchet wheel by means of the pawl; the shaft being thus locked, the sprocket wheels are stopped, the drum-shaft runs freely by the friction clutch, and the two pulleys which are connected by the crossed hand are running idle. When the load to be weighed comes upon the platform, the end of the steelyard rises and unlocks the ratchet wheel; the sprocket gear is driven by the friction clutch, and drives the axle of the left-hand small pulley. The main wheels come into operation and the poise is carried along till the end of the steelyard drops, and locks the ratchet wheel. By means of a horizontal rod, the same drop of the steelyard also locks together by clutch gearings the left-hand poise and pulley and the adjacent sprocket wheel, and the pulley drives the sprocket wheel in the opposite direction to that which it had before. Consequently the motion of the mitre wheels is reversed and the poise is run back to zero. When the poise arrives at zero it frees the clutch which connects the poise and the sprocket wheel, and the machine is then ready for the next load.

The poise having arrived at the end of its run and unable to go further, the mitre wheels and the sprocket gearing are stopped, and the two pulleys and the cross bar in the load case drop back to the bottom of the steelyard.

**Automatic Luggage Weighing Machine:** This machine is intended for the weighing of personal luggage at railway stations. It consists of a platform which is carried by levers arranged in the manner of an ordinary platform machine, which are connected with the registration mechanism by a vertical rod. This rod is continued upwards by a pair of thin nickel bands which are led right and left over two horizontal cylinders, round which they partly wrap, and to which they are firmly attached. The diameter of the middle part of the cylinders is greater than that of the ends, and the bands from the vertical rod are led over the middle part. To each cylinder a pair of similar nickel bands are led downwards from the top of a casting which is bolted to the frame. The lower ends of these bands pass round the under side of the end portions of the cylinders, wrapping close round them, and are firmly attached to them. To the bottom of each cylinder is rigidly attached a heavy solid cylinder of lead, and these are the regulators of the position of equilibrium of the cylinders when they rotate under the action of the lead. When the load comes upon the platform the pull of the vertical rod is transmitted by the nickel bands to the cylinders around which they are wrapped, and causes them to revolve. As they rotate they roll themselves up the pairs of bands which are attached to the top of the casting, and at the same time pull the weights attached to the bottoms of the cylinders to take up a lateral position, where they exercise a leverage opposing the motion of the cylinders, and bringing them up in a definite position corresponded to the pull of the weight. By the rolling of the cylinders up the vertical bands from the casting the cylinders are raised vertically through a space defined by the position of the leaden regulators. By means of suitable and simple mechanism this vertical movement of the cylinders works plunger pistons in a pair of cylinders which contain glycerin, and these deaden the vibrations of the machinery while weighing is going on. The same vertical movement also actuates the index finger of a large dial, on which the weight of the luggage can be easily read by passengers standing near while their luggage is being weighed.

**WEIGHTS AND MEASURES.** This subject may be most conveniently considered under three aspects—i. Scientific; ii. Historical; and iii. Commercial.

1. **Units.** In the United Kingdom two systems of weights and measures are now recognized—the imperial and the metric. The fundamental units of the imperial system are length, the yard and metre; and of mass, the pound and kilogram.

The legal theory of the British system of weights and measures is—(a) the standard yard, with all linear measures and their
WEIGHTS AND MEASURES

For the weight of the cubic decimetre of water, as deduced from the experiments made in London in 1896 as to the weight of the cubic inch of water, D. Mendeleeff (Proc. Roy. Soc., 1895) has obtained the following results, which have been adopted in legislative enactments in the United Kingdom:

<table>
<thead>
<tr>
<th>Temperature on the Hydrogen Thermometer Scale</th>
<th>Weight of Water in vacuo</th>
</tr>
</thead>
<tbody>
<tr>
<td>o°</td>
<td>32°-0</td>
</tr>
<tr>
<td>4</td>
<td>392</td>
</tr>
<tr>
<td>15</td>
<td>59-0</td>
</tr>
<tr>
<td>163</td>
<td>62-0</td>
</tr>
<tr>
<td>20</td>
<td>68-0</td>
</tr>
</tbody>
</table>

In this no account is taken of the compressibility of water—that is to say, it is supposed that the water is under a pressure of one atmosphere. The weight of a cubic decimetre of water reaches 1000 grammes under a pressure of four atmospheres; but in vacuo, at all temperatures, the weight of water is less than a kilogram.

3. National Standards.—National standards of length are not legally now referred to natural standards or to physical constants, but it has been shown by A. A. Michelson that a standard of length might be restored, if necessary, by reference to the measurement of wave-lengths of light. Preliminary experiments have given results correct to ±0.5 micron, and it appears probable that by further experiments, results correct to ±0.014 may be obtained. That is to say, the metre might be restudied or restored as to its length within one ten-millionth part, by reference to, e.g., 1553163.5 wave-lengths of the red ray of the spectrum of cadmium, in air at 15° C. and 760 mm.

In all countries the national standards of weights and measures are in the custody of the Board of Trade. Scientific research is not, of course, bound by official standards.

For the care and functioning of national standards the Standards Department was developed, under the direction of a Royal Commission 4 of which the late Henry Williams Chisholm was a leading member, to conduct all comparisons and other operations with reference to weights and measures in aid of scientific research or otherwise, which it may be the duty of the state to undertake. Similar standardizing offices are established.

4 Valoir du Mètre, A. A. Michelson (Paris, 1894); Units, Everett, Illustrations of C.G.S. System; Units et Échelles, Guillaume (Paris, 1890); Lupton’s Numerical Tables, 1892; Metric Equivalent Cards, 1901; Dictionary of Metric Measures, L. Clark (1894); Glasscock and Shaw’s Physics (1901).

For the equivalent of the litre in terms of the gallon, see below III. Commercial.

In the measurement of the cubic inch it has been found that 3 the specific mass of the cubic inch of distilled water is of water at the temperature of 62° F., and under an atmospheric pressure equal to 30 in. (at 32° F.), is equal to 252.297 grains weight of water at its maximum density (4°C.). Hence a cubic foot of water would weigh 62.281 lb avoirdupois, but 62.321 lb as at present legally taken.

For the specific mass of the cubic decimetre of water at 4°C., under an atmospheric pressure equal to 760 mm., Guillaume and Chappuis of the Comité International des Poids et Mesures at Paris (C.I.P.M.) have obtained o-99999707 kg., which has been accepted by the committee.

The two standards, the cubic inch and the cubic decimetre, may not be strictly comparable owing to a difference in the normal temperature (Centigrade and Fahrenheit scales) of the two units of extension, the metre and the yard.

in other countries (see Standards). Verified "Parliamentary Copies" of the imperial standard are placed at the Royal Mint, with the Royal Society, at the Royal Observatory, and in the Westminster Palace.

The forms of the four primary standards representing the four units of extension and mass are shown in figs. 1 to 4.

A secondary standard measure for dry goods is the bushel of 1834, containing 8 imperial gallons, represented by a hollow bronze cylinder having a plane base, its internal diameter being double its depth.

The imperial standard measure of capacity is a hollow cylinder (fig. 5) made of brass, with a plane base, of equal height and diameter; which when filled, was determined by a plane glass disk, contains 10 lb weight of water at 1 °F. = 36 in., weighed in air against brass weights.

4. Atmospheric Pressure, and Materials.—In the verification of a precise standard of length there may be taken into account the influence of the variation of atmospheric pressure. Taking the range of the barometer in Great Britain from 28 to 31 in., giving a difference of 3 in. (76 millimetres), which denotes a variation of 103 grammes per square centimetre in the pressure of the atmosphere, the change caused thereby in the length of a standard of linear measurement would appear to be as follows:

For the yard measure of the form shown in fig. 1 a difference of length equal to 0.000002 in. is caused by the variation of atmospheric pressure from 28 to 31 in. For the metre of the form shown in fig. 3 the difference in length for a variation 0.76 mm. in the barometer would be 0.00000285 mm. on the metre.

With reference to the materials of which standards of length are made, it appears that the Matthey alloy iridio-platinum (90% platinum, 10% iridium) is probably of all substances the least affected by time or circumstance, and of this costly alloy, therefore, a new copy of the imperial yard has been made. There appears, however, to be some objection to the use of iridio-platinum, as, owing to its great density (Δ = 21.57), the slightest abrasion will make an appreciable difference in a weight; sometimes, therefore, quartz or rock-crystal is used; but to this also there is some objection, as owing to its low density (Δ = 2.65) there is a large exposed surface of the mass. For small standards weights platinum (Δ = 21.45) and aluminium (Δ = 2.70) are used, and there is also an alloy of palladium (60%) and silver (40%) (Δ = 11.00). For ordinary standards of length Guillaume's alloy (mixture of 35.7% nickel and 64.3% steel) is highly polished, and is capable of linear expansion only 0.0000008 for 1 °C.

5. Electrical Standards.—Authoritative standards and instruments for the measurement of electricity, based on the fundamental units of the metric system, have been placed in the Electrical Laboratory of the Board of Trade. These include

- The standard amperes, and sub-standard from 10 to 100 milliamperes.
- The standard volt, and sub-standard for the measurement of pressure from 5 to 300 psi.
- The standard ohm, sub-standard up to 100,000 ohms, and below 1 ohm to one ohm.

6. Temperature.—In the measurement of temperature the Fahrenheit scale is still followed for imperial standards, and the Centigrade scale for metric standards. At the time of the construction of the imperial standards in 1844, Sheepshanks's Fahrenheit thermometers were used; but it is difficult to say now what the true temperature then, of 62 °F., may have been as compared with 62 °F., or 16-667 °C., of the present normal hydrogen scale. For meteorological purposes, the C.I.P.M. have adopted as a normal thermometric scale the Centigrade scale of the hydrogen thermometer, having for fixed points the temperature of pure melting ice (0°) and that of the vapour of boiling distilled water (100°), under a normal atmospheric pressure; hydrogen being taken under an initial manometric pressure of 1 metre, that is to say, at 101.325 mm. or 760 mm., the normal atmospheric pressure. This latter is represented by the weight of a column of mercury 760 mm. in height; the specific gravity of mercury being now taken as 13.5950, after Volkmann and Marek, and at the normal intensity followed under this pressure. The value of this intensity is equal to that of the force of gravity at the Bureau International, Paris (at the level of the Bureau), divided by 1,000,332; a co-efficient which allows for theoretical reduction to the latitude 45° and to the level of the sea.

The length of the metre is independent of the thermometer so far that it has its length at a definite physical point, the temperature of melting ice (0° C.), but there is the practical difficulty that for ordinary purposes measurements cannot be always carried out at 0° C.

The International Geodetic Committee have adopted the metre and their unit of measurement. In geodetic measurements the dimensions of the triangles vary with the temperature of the earth, but these variations in the same region of the earth are smaller than the variations of the temperature of the air, less than 10° C. Adopting as a co-efficient of dilatation of the earth's crust 0-000002, the variations of the distances are smaller than the errors of measurement (see Geodesy).

7. Standardizing Institutions.—Besides the State departments dealing with weights and measures, there are other standardizing institutions of recent date. In Germany, e.g., there is at Charlottenburg (Berlin), a technical institute (Physikalisch - technische Reichsanstalt) established under Dr W. Forster in 1887, which undertakes researches with reference to physics and mechanics, particularly as applied to technical industries. In England a National Physical Laboratory (N.P.L.) has been established, based on the German institute, and has its principal laboratory at Bushy House, near Hampton, Middlesex. Here is carried out the work of standardizing measuring instruments of various sorts in use.

---

1 Wissenschaftliche Abhandlungen der physikalischen Reichsanstalt, Band ii. (Berlin, 1900); Denkschrift betreffend die Tatigkeit der K. Norm.-Aichungs Komm. (1869-1900).
by manufacturers, the determination of physical constants and the testing of materials. The work of the Kew Observatory, at the Old Deer Park, Richmond, has also been placed under the direction of the N.P.L. (see III. Commercial). The C.I.P.M. at Paris, the first metrological institution, also undertakes verifications for purely scientific purposes. A descriptive list of the verifying instruments of the Standards Department, London, has been published. In the measurement of woolen and other textile fabrics, as to quality, strength, number of threads, &c., there exists at Bradford a voluntary standardizing institution known as the Conditioning House (Bradford Corporation Act 1887), the work of which has been extended to a chemical analysis of fabrics.

8. Ancient Standards of England and Scotland.—A “troy pound” and a new standard yard, as well as secondary standards, were constructed by direction of parliament in 1758-1760, and were deposited with the Clerk of the House of Commons. When the Houses of Parliament were burned down in 1834, the pound was lost and the yard was injured. It may here be mentioned that the expression “imperial” first occurs in the Weights and Measures Act of 1824. The injured standard was then lost sight of, but it was in 1891 brought to light by the Clerk of the Journals, and has now been placed in the lobby of the residence of the Clerk of the House, together with a standard “stone” of 14 lb.

In the measurement of liquids the old “wine gallon” (213 cub. in.) was in use in England until 1824, when the present imperial gallon (fig. 5) was legalized; and the wine gallon of 1707 is still referred to as a standard in the United States. Together with the more ancient standard of Henry VII. and of Queen Elizabeth, this standard is deposited in the Jewel Tower at Westminster. They are probably of the Norman period, and were kept in the Pyx Chapel at Westminster, now in the custody of the Commissioners of Works. A sketch of these measures is given in fig. 6.

Besides these ancient standards of England (1495, 1588, 1601) there are at the council chambers of Edinburgh and

**Fig. 6.—A. Winchester Bushel of Henry VIII.; B, Standard weight (112 lb) of Elizabeth; C, Ale Gallon of Henry VIII.; D, the old Wine Gallon.**

Linlithgow some of the interesting standards of Scotland, as the Stirling jug or Scots pint, 1618; the chapman’s half-pint, 1555 (fig. 7); the Lanark troy and tron weights of the same periods (fig. 8).

*English Weights and Measures Abolished.*—The yard and handful, or 40 in. ell, abolished in 1439. The yard and inch, or 37 in. ell (cloth measure), abolished after 1555; known later as the Scotch ell = 37-06. Cloth ell of 45 in. used till 1600. The yard of Henry VII. = 35-963 in. Saxon moneys pound, or Tower pound, 5400 grains, abolished in 1537. Mark, 1 pond = 5600 grains. Troy pound in use in 1415, established as monetary pound 1527. Troy weight was abolished, from the 1st of January 1879, by the Weights and Measures Act 1875, with the exception only of the Troy ounce, its decimal parts and multiples, legalized in 1853, 16 Vict. c. 29, to be used for the sale of gold and silver articles, platinum and precious stones. Merchant’s pound, in 1270 established for all except gold, silver and medicines = 7200 grains, generally superseded by avoidipous in 1303.

**Fig. 7.—The Scots Choppin or Half-Pint, 1555.**

**Fig. 8.—Linlark Stone Troy Weight, 1618.**

VII), gradually modified until fixed in 1826 at 277.24, or 10 pounds of water.

*French Weights and Measures Abolished.*—Often needed in reading older works.

Rhineland foot, much used in Germany, = 12-357 in. = the foot of the Scotch or English cloth ell of 37-06 in., or 3×12-357. (H. J. C.)

II. *Ancient Historical*

Though no line can be drawn between ancient and modern metrology, yet, owing to neglect, and partly to the scarcity of materials, there is a gap of more than a thousand years over which the connexion of units of measure is mostly guess-work. Hence, except in a few cases, we shall not here consider any units of the middle ages. A constant difficulty in studying works on metrology is the need of distinguishing the absolute facts of the case from the web of fiction in which each writer has woven them—often the names used, and sometimes the very existence of the units in question, being entirely an assumption of the writer. Again, each writer has his own leaning: A. Böckh, to the study of water-volumes and weights, even deriving linear measures therefrom; V. Queipo, to the connexion with Arabic and Spanish measures; J. Brandis, to the basis of Assyrian standards; Mommsen, to coin weights; and P. Bortolotti to Egyptian units; but F. Hultsch is more general, and appears to give a more equal representation of all sides than do other authors. In this article the tendency will be to trust far more to actual measures and weights than to the statements of ancient writers; and this position seems to be justified by the great increase in materials, and their more accurate means of study. The usual arrangement by countries has been mainly abandoned in favour of following out each unit as a whole, without recurring to it separately for every locality.

The materials for study are of three kinds. (1) *Literary,* both in direct statements in works on measures (e.g. Elias of Nisibis), medicine (Galien) and cosmetics (Cleopatra), in ready-reckoners (Didymus), clerk’s (kāthī’s) guides, and like handbooks, and in indirect explanations of the equivalents of measures mentioned by authors (e.g. Josephus). But all such sources are liable to the most confounding errors, and some passages relied on have in any case to submit to conjectural emendation. These authors are of great value for connecting the monumental information, in the absence of the actual standards of ancient times the units of measure and of weight have to be inferred from the other remains; hence unit in this division is used for any more or less closely defined amount of length or weight in terms of which matter was measured.

3. Report on Standards deposited in House of Commons, 1st November 1891.
WEIGHTS AND MEASURES

but must yield more and more to the increasing evidence of actual weights and measures. Besides this, all their evidence is but approximate, often only stating quantities to a half or quarter of the amount, and seldom nearer than 5 or 10%; hence they are entirely worthless for all the closer questions of the approximation or original identity of standards in different countries; and it is just in this line that the imagination of writers has led them into the greatest speculations, unchecked by accurate evidence of the original standards. (2) Weights and measures their wide and detailed range of information, these most unsatisfactory on account of the constant temptation to diminish their weight, a weakness which seldom allows us to reckon them as of the full standard. Another defect in the evidence of coins is that, when one variety of the unit of weight was once fixed on for the coinage, there was (barring the depreciation) no departure from it, because of the need of a fixed value, and hence coins do not show the range and character of the real variations of units as do buildings, or vases, or the actual commercial weights.

**PRINCIPLE OF STUDY.**—1. Limits of Variation in Different Copies, Places and Times. Unfortunately, so very little is known of the ages of weights and measures that this datum—most essential in considering their history—has been scarcely considered. In measure, Egyptians of Dynasty IV. at Gizeh on an average varied 1 in 330 between different buildings (27). Buildings at Persepolis, all of nearly the same age, vary in unit 1 in 450 (25). Including a greater range of time and place, the Roman foot in Italy varied during two or three centuries on an average 1 in 400 from the mean. Covering a longer time, we find an average variation of 1 in 60 in the Attic foot (25), 1 in 16 in the English foot (25), and 1 in 3 in the English money foot (25). Se we may say that an average variation of 1 in 10 by toleration, extending to double that by change of place and time, is usual in ancient measures. In weights of the same place and age there is a far wider range; at Delfeneh (29), within a century probably, the average variation of different units is 1 in 500, and 1 in 500, the range being just the same as in all times and places taken together. Even in a set of weights all found together, the average variation is only reduced to 1 in place of 1 in 29 (29). Taking a wider range of place and time, the Roman libra has an average variation of 1 in the centuries of better period (43), and in those of Byzantine age 1 in 44 (44). Altogether, we see that weights have descended from original varieties with so little intercomparison that no rectification of their values has been made, and hence there is as much variety in any one place and time as in all together. Average variation may be said to range from 1 in 500 to 1 in 500 in different units, doubtless greatly due to defective balances.

2. Rate of Variation. Though large differences may exist, the rate of general variation is but slow—excluding, of course, all monetary standards. In Egypt the cubit lengthened 1 in some thousands of years (25, 44). The Italian mile has lengthened 1 in since Roman times (2); the English mile lengthened about 1 in four centuries (31). The English foot has not appreciably varied in several centuries (25). Of weights there are scarce any dated, excepting coins, which nearly all decrease; the Attic tetradrachm, however, increased 1 in three centuries (28), owing probably to its being below the average trade weight to begin with. Roughly dividing the Roman weights, there appears a decrease of 1 in from imperial to Byzantine times (25).

3. Tendency of Variation. This is, in the above cases of lengths, to an increase in course of time. The Roman foot is also probably 1 larger than the earlier form of it, and the later form in Britain and Africa perhaps another 1 larger (25). Probably measures tend to increase and weights to decrease in transmission from time to time or place to place.

4. Details of Variation. Having noticed variation in the gross, we must next observe its details. The only way of examining these is by drawing curves (26, 29), representing the frequency of occurrence of the variations of a unit; for instance, in the Egyptian unit—the cat—counting in a large number how many occur between 140 and 141 grains, 141 and 142, and so on; such numbers represented by curves show at once where any particular varieties of the unit lie (see Naukratis, i. 83). This method is only applicable where there is a large number of examples; but there is no other way of studying the details. The results from such a study—of the Egyptian cat, for example—show that there are several distinct families or types of a unit, which originated in early times, have been perpetuated by copying, and reappear alike in each locality (see Tanis, ii. p. 1). Hence we see that if one unit is derived from another it may be possible, by the similarity or difference of the forms of the curves, to discern whether it was derived by general consent and recognition from a standard in the same condition of distribution as that in which we know it, or whether it was derived from it in earlier times before it became so varied, or by some one action forming it from an individual example of the other standard without any variation being transmitted. As our knowledge of the age and locality of weights increases these criteria in curves will prove of greater value; but even now no consideration of the different units should be made without a graphic representation to compare their relative extent and nature of variation.

5. Transfer of Units. The transfer of units from one people to another takes place almost always by trade. Hence the value of such evidence in pointing out the ancient course of trade and commercial connections (17). The great spread of the Phoenician weight on the Mediterranean, of the Persian in Asia Minor and of the Assyrian in Egypt are evident cases; and that the decimal weights of the laws of Manu (43) are decidedly not Assyrian or Persian, but on exactly the Phoenician standard, is evidence of trade by water and not overland. If, as seems probable, units of length may be traced in prehistoric remains, they are of great value; at Stonehenge, for instance, the earlier parts are laid out by the Phoenician foot, and the later by the Pelasgo-Roman foot (26). The earlier foot is continually to be traced in other megalithic remains, whereas the latter very seldom occurs (25). This bears strongly on the Phoenician origin of our prehistoric civilization. Again, the Belgic foot of the Tungri is the basis of the present English land measures, which we thus see are neither Roman nor British in origin, but the transfer of units is naturally a unit of transfer from a higher and more civilized people; but the near resemblance of measures in different countries should always be corroborated by historical considerations of a probable connexion by commerce or origin (Head, Historia Numorum, xxxvii). It should be borne in mind that in early times the larger values, such as minae, would be transmitted by commerce, while after the introduction of coinage the lesser values of shekels and drachmae would be the units; and this needs notice, because usually a borrowed unit was multiplied or divided according to the ideas of the borrowers, and strange modifications thus arose.
6. Connexions of Lengths, Volumes and Weights.—This is the most difficult branch of metrology, owing to the variety of connexions which can be suggested, to the vague information we have, especially on volumes, and to the liability of writers to rationalize connexions which were never intended. To illustrate how easy it is to go astray in this line, observe the continual reference to the cubic cubit as the equivalent of various metal cubits. It can be shown that the cubit cubic is very nearly 250 grains, while the gallon has actually been fixed at 10 lb of water; the first two are certainly mere coincidences, as may very probably be the last also, and yet they offer quite as tempting a base for theorizing as any connexions in ancient metrology. No such theories can be counted as more than coincidences which have been adopted, unless we find a very exact connexion, or some positive statement of origin. The idea of connecting volume and weight has received an immense impetus through the metric system, but it is not very prominent in ancient times. The Egyptians report the weight of a measure of various articles, amongst others water (6), but lay no special stress on it; and the fact that there is no measure of water equal to a direct decimal multiple of the weight-unit, except very high in the scale, does not seem as if the volume was directly based upon weight. Again, there are many theories of the equivalence of different cubit cubs of water with various multiples of talents (2, 3, 18, 24, 33); but connexion by lesser units would be far more probable, as the primary use of weights is not to weigh large cubical vessels of liquid, but rather small containers, as to render human actions which are equal to the cubic foot, and containing 80 librae of water, is one of the strongest cases of such relations, being often mentioned by ancient writers. Yet it appears to be only an approximate relation, and therefore probably accidental, as the volume by the examples is too large to agree to the cube of the length or to the weight, differing $\frac{1}{4}$, or sometimes even $\frac{1}{2}$.

Another idea which has haunted the older metrologists, but is still less likely, is the connexion of various measures with degrees on the earth's surface. The lameness of the Greeks in angular measures, would alone show that they could not derive their measures from long and accurately determined distances on the earth.

7. Connexions with Coinage.—From the 7th century B.C. onward, the relations of units of weight have been complicated by the need of the interrelations of gold, silver and copper coinage; and various standards have been derived theoretically from others through the weight of one metal equal in value to a unit of another. That this mode of originating standards was greatly promoted, if not started, by the use of coinage we may see by the rarity of the Persian silver weight (derived from the Assyrian standard), soon after the introduction of coinage, as shown in the weights of Defenn (29). The relative value of gold and silver (27, 21) in Asia is agreed generally to have been 133 to 1 in the early ages of coinage; at Athens in 434 B.C. it was 14:1; in Macedon, 550 B.C., 12:1; in Egypt, 300 B.C., 151:1; in Rome, 140 B.C., 12:1; in Italy in 1st century, it was 12:1 in the later empire 13:01, and under Justinian 14:1. Silver stood to copper in Egypt as 80:1 (Brugsch), or 120:1 (Reville); in early Italy and Sicily as 250:1 (Mommsen), or 120:1 (Soutou), under the empire 120:1, and under Justinian 100:1. The distinction of the use of standards for trade in general, or for silver or gold in particular, should be noted. The early observance of the relative values may be inferred from Num. vii. 13, 14, where silver offerings are 13 and 7 times the weight of the gold, or of equal value and one-half value.

8. Legal Regulations of Measures.—Most states have preserved official standards, usually in temples under priestly custody. The Hebrew "shekel of the sanctuary" is familiar; the standard volume of the apet was secured in the drums of Anubis at Memphis (35); in Athens, besides the standard weight, twelve copies for public comparison were kept in the city; also standard volume measures in several places (2); at Pompeii the block with standard volumes cut in it was found in the portico of the forum (33); other such standards are known in Greek cities (Gytheion, Pantheon at Alexandria) (11, 35); at Rome the standards were kept by the king in the temple of Hercules (2); the standard cubit of the Nilometer was before Constantine in the Serapeum, but was removed by him to the church (2). In England the Saxon standards were kept at Winchester before A.D. 950 and copies were legally compared and stamped; the Normans removed them to Westminster to the custody of the king's chambers at the exchequer; and they were preserved in the crypt of Edward the Confessor, while remaining royal property (8). The oldest English standards remaining are those of Henry II. Many others have been found in the temples of Demeter at Cnidos, the temple of Artemis at Ephesus, and in a temple of Aphrodite at Byblos (44); and the making or sale of weights may have been a business of the custodians of the temple standards.

9. Names of Units.—It is needful to observe that most names of measures are generic and not specific, and cover a great variety of units. Thus foot, digit, palm, cubit, stadium, mile, talent, mina, stater, drachm, obol, pound, ounce, grain, metretes, medimnus, modius, hin and many others mean nothing except qualified by the country of their currency. Also, it should be noted that some ethnic qualifications have been applied to different systems, and such names as Babylonian and Euboic are ambiguous; the normal value of a standard will therefore be used here rather than its name, in order to avoid confusion, unless specific names exist, such as kat and uten.

All quantities stated in this article without distinguishing names are in British units of inch, cubic inch or grain.

Standards of Length.—Most ancient measures have been derived from one of two great systems, that of the cubit of 20-69 in., or the digit of 729 in.; and both these systems are found in the earliest times.

20-63 in.—First known in Dynasty IV in Egypt, most accurately preserved in the Great Pyramid, varying 20-51 to 20-71 in Dyn. IV. to VI. (27). Divided decimally in 100ths; but usually marked in Egypt into 7 palms of 28 digits, approximately: a mere juxtaposition (for convenience) of two incommensurate systems (25, 27). The average of several cubit rods remaining is 20-65, age in general about 1000 B.C. (33). At Philae, &c., in Roman times 20-76 on the Nilometers (44). This unit is also recorded by cubit lengths scratched on walls of temples. Bers has expressed the impression of Ramessu IV. and of Edfu temple (5) in papyri. From this cubit, mahi, was formed the xylon of 3 cubits, the usual length of a walking-staff; fathom, rent, of 4 cubits, and the sket of 40 cubits (18); also the gnomon of $\frac{1}{2}$ of 1000 cubits, actually found marked on the Memphis-Faium road (44).

Babylonia had this unit nearly as early as Egypt. The divided oblong unit has been derived by the deduction of a unit of length denoting the cubit weights and cubic measure, rather than by deriving cubic measure through the unit of length.
Weights and Measures

In Etruria it probably appears in tombs as 25.45 (25); perhaps in Roman Britain, and in medieval England as 12.7 (25).

13.8 in. This foot is scarcely known monotonically. On three occasions Egyptian cubits there is a prominent mark at the 19th digit, which agrees with the Babylonian foot (11) and weight (33). It is borne on the stones of the temple of Senkereh 2500 ft. (33). It is also used in the temple of Karnak 2500 ft. (33). It is used in the temple of Karnak 2500 ft. (33).

In Assyria and Babylonia show 20 to 20.6. The Babylonian system was sexagesimal, thus (18)—

</tr>
</tbody>
</table>

In this case the unit in early times was the temple of Eshnunna 20.55–55. Samos 20–62. Hultsch also claims Priene 20–90, and the stadia of Aphrodisia 20–67 and Laodicce 20–94. Ten buildings in all give 20.63 mean (16, 25); but in Armenia it arose to 20–76 in late Roman times (25). (20775) is divided by 1, the foot of this as being the cubic foot.

1245 in. This was especially the Greek derivative of the 20.63 cubit. It originated from the Babylonian as the foot of the temple of Eshnunna 20.55. It is in accordance with the sexary system applied to the early decimal division of the cubit in Greece. It is the most usual unit, occurring in the Propylaea at Athens 12–14, temple of Olympian Zeus 12–14, and, in the city of Alexandria 12–14; and (18); thirteen buildings giving an average of 12–45, mean variation ±0.05 (25). The digit is an elephant, a foot of 12–44; then the system is 100 in. 7270. In the Parthenon 20–5. 7270

The construction of this system (25) is only an inference from the facts yet known, for which we have insufficient information to prove it, though it seems the simplest and most likely history.

11.62 Seeing the good reasons for this digit having been exported to the West from Egypt—from the presence of the 16×7.62, 18.23 cubit in Egypt, and from the 27.92 digit being the decimal base of the Greek long measures—it is not surprising to find it in use in Italy as a digit, and multiplied by 16 as a foot. The more so as the half of this foot, or 8 digits, is marked off as a measure on many of the Egyptian cubit rods held 2000 b.c.; the Babylonian (not noticing the Greek link of the digit), he agrees that it is supported by the Egyptian square measure of the plethron, being thus the common acentric of all the systems of the south. If 11–6 appears pronounced in the prehistoric and early Greek records and is certainly found in Etruscan tomb dimensions as 11.59 (25). Dörpfeld considers this the Attic foot, and states the foot of the Greek metrology as 15.22. Oxford University Press (38) for 2000–1500 B.C. and that it probably passed from the East through Greece to Etruria, and thence became the standard foot of Rome; there, though divided by the Italian duodecimal system into 12 unice, it always maintained its original 16 digits, which are found marked on some of the foot-measures. The well-known ratio of 25.24 between the 16–12 foot and this we see has arisen through one being 10 of 25.24, the other 16 being as 25.24; the legal ratio the 12 foot-measures (1) gives 11.689 =.008, and of long lengths and buildings 11.667 =.01. In Britain and Africa, however, the Romans used a rather longer form (25) of 11.68, or the foot of 7.96. The 12 foot-measures (1) gives 11.648 =.008, and the foot of 7.96.

Either from its Pelasgic or Etrurian use or from Romans, this foot appears to have come into prehistoric remains, as the circle of Stonehenge (26) is 100 ft. of 11.68 across, and the same is found in one or two other cases. 11.60 also appears as the foot of some much older Etruscan buildings.

We now pass to units between which we cannot state any connection.

25.3 The earliest sign of this cubit is in a chamber at Abydos (44) about 1400 b.c.; there, below the sculptures, the plain wall is marked out by red designing lines in spaces of 25.3 =.03 in., which have no relation to the size of the chamber or to the sculpture. This fact has therefore been marked by a workman using a cubit of 25.3. Apart from medieval and other very uncertain data, such as the Sabbath day's journey being 2000 middle pacing for 2000 cubits, it appears that Josephus, using the Greek or Roman cubit, gives half as much more to each dimension of the temple than does the Talmud; this shows the cubit used in the Talmud for temple measures to be certainly not under 25 in. Evidence of the early period is given, moreover, by the statement in 1 Kings of the Egyptian cubit rods (33). Though Cepheus has opposed this conception, and has been 2300 cub. in., this would show a cubic of 25 in. The corrupt text in Chronicles of 3000 baths would need a still longer cubit; and, if a longer cubit is used, the result shows for the bath would be incomparably small. For other Jewish cubits see 18.2 and 21.6. Oppert (24) concludes from inscriptions that there was in Assyria a royal cubit of the U cubit; 25–20; and four monuments show 25 (25) a cubit averaging 25.28. For Persia Queipo (33) relies on, and develops, an Arab statement that the Arab hashama cubit was the royal Persian, thus fixing it at about 25 in.; and the Persian guerze at present is 25, the royal guerze being 13 times this, or being 300 cubits. As 1 cubit is usually a unit of Hippodamia of the measure of Hippodamia, we may take 25.34 as the nearest approach to the ancient Persian unit.

The circuit of the 21-inch boll of Ctesiphon is 54.8 in. The result is stated on a tablet as 24.750 ft. (U), and from the actual size the U is therefore 10.805 in. Hence the recorded series of measures on the Senkereh tablet are valued (Oppert) as—

10-9 marked on them, which seems like this same unit (33).
This cubit was also much used by the Jews (33), and is so often
referred to that it has eclipsed the 25-1 cubit in most writers. The
Gemara names 3 Jewish cubits (2) of 5, 6 and 7 palms; and, as
Oppert (24) shows that 25-2 was reckoned 7 palms, 21-6 being 6
palms, we may reasonably apply this scale to the Gemara list, and
read it as 18, 21-6 and 25-2 in. There is also a great amount of
medieval and other data showing this cubit of 21-6 to have been
familiar to the Jews after their captivity but there is no evidence
for its earlier date, as there is for the 25-in. cubit (from the brazen
sea) and for the i8-in. cubit from the Siloam inscription.
From Assyria also it passed into Asia Minor, being found on the
city standard of Ushak in Phrygia (33), engraved as 21-8, divided
into the Assyrian foot of 10-8, and half and quarter, 5-4 and 2-7.
Apparently the same unit is found (18) at Heraclea in Lucania,
21-86; and, as the general foot of the South Italians, or Oscan foot
of the jugerum,
(18), best defined by the 100 feet square being
and therefore = 10-80 or half of 21-60. A cubit of_2i -5 seems certainly
to be indicated in prehistoric remains in Britain, and also in early
Christian buildings in Ireland (25).
22-2.
Another unit not far different, but yet distinct, is found
apparently in Punic remains at Carthage (25), about 11-16 (22-32),
and probably also in Sardinia as 11-07 (22-14), where it would

as it is found at the early temple of Mujfayyir (Ur) ; and, with a few
other cases (25), it averages 19-97. It is described by Oppert (24),
of 222 susi or 39-96, double of
from literary sources, as the great
19-98; from which was formed a reed of 4 great U or 159-8. The
same measure decimally divided is also indicated by buildings in
Asia Minor and Syria (25).
19-2.
In Persia some buildings at Persepolis and other
places
(25) are constructed on a foot of 9-6, or cubit of 19-2; while the
modern Persian arish is 38-27 or 2X19-13. The same is found
very clearly in Asia Minor (25), averaging 19-3; and it is known in
literature as the Pythic foot (18, 33) of 9-75, or J of 19-5, if Censorinus is rightly understood. It may be shown by a mark (33) on
the 26th digit of Sharpe's Egyptian cubit = 19-2 in.
This measure does not seem to belong to very early times,
13-3.
and it may probably have originated in Asia Minor. It is found
there as 13-35 in buildings. Hultsch gives it rather less, at 13-1,
"
small Asiatic foot." Thence it passed to Greece, where it

at Mashita (A.D. 620),
apparently till the building of the palace
where it is 13-22, according to the rough measures we have (25).
And it may well be the origin of the dira* Stambuli of 26-6, twice
I3'3- Found in Asia Minor and northern Greece, it does not appear
unreasonable to connect it, as Hultsch does, with the Belgic foot
of the Tungri, which was legalized (or perhaps introduced) by
Drusus when governor, as | longer than the Roman foot, or 13-07;
this statement was evidently an approximation _by an increase of 2
digits, so that the small difference from 13-3 is not worth notice.
Further, the pertica was 12 ft. of 18 digits, i.e. Drusian feet.
Turning now to England, we find (25) the commonest building
foot up to the 1 5th century averaged 13-22. Here we see the Belgic
foot passed over to England, and we can fill the gap to a considerable
extent from the itinerary measures. It has been shown (31) that
the old English mile, at least as far back as the 1 3th century, was
It was therefore equal to 79,200 in., and

Such a regular and extensive system could not have been put into
use throughout the whole country suddenly in 1250, especially as
it must have had to resist the legal foot now in use, which was
(9) as early as 950. We cannot suppose that such a system
would be invented and become general in face of the laws enforcing

It
js
Britain is the double of the modern decimal metric system. Had it
not been unhappily driven out by the 12-in. foot, and
repressed
by statutes both against its yard and mile, we should need but a
small change to place our measures in accord with the metre.
The Gallic leuga, or league, is a different unit, being 1-59 British
miles by the very concordant itinerary of the Bordeaux pilgrim.
This appears to be the great Celtic measure, as opposed to the old
English, or Germanic, mile. In the north-west of England and in
Wales this mile lasted as 1-56 British miles till 1500; and the percl
of those parts was correspondingly longer till this century (31)
The " old London mile " was 5000 ft., and probably this was th
mile which was modified to 5280 ft., or 8 furlongs, and so became th
British statute mile.

STANDARDS OF AREA. We cannot here describe these in detail.
Usually they were formed in each country on the squares of the Ion
measures. The Greek system was

10 baths = 41 Attic or 31 Sicilian medimni, for which it is agreed w
must read modii (33); hence the bath = 2300 cub. in. Thus thea
three different reckonings agree closely, but all equally depend on the
Greek and Roman standards, which are not well fixed. The Sicilian
modius here is ^, or slightly under J, of the bath, and so probably
,

;

:


Punic variant of the bath or saton of Phoenicia. One close datum, if trustworthy, would be log of water = Assyrian mina = bath about 2200 cub. in. The rabbinical statement of cub. of 21:5 holding 320 lbs. puts the bath at above 2400 cub. in.; their log-masure, holding six men's heads, seems to be over to rather than under this amount; but their reckoning of bath = cub. cubed is but approximate; by 21:5 it is 1240, by 25:1 it is 1990 cub. in. The earliest Hebrew system was:

| 3 lb. | 6 bath, 6 metretesor 1920. | 2200 | 3570 | baths, | 1920.

The 'issarón ("tenth-deal") is also called gomer. The log and cub are not found till the later writings; but the ratio of bin to 'issarón is practically fixed in early times by the proportions in Num. xv. 4-9. Epiphanes (XVII. 6) refers to the actual practice.

The Syrian system was (18):

| c.w. | w. 19 = s. 18 = bath or saton, | 18 = 30 = 190 | 300 = 190 | 300 =

The approximate value from capita = 2 Attic choinixes (Xenophon) warrants us in taking the achane as fixed in the following system, which places it closely in accord with the preceding.

In Persia Hulius:

| 1 a. | 40 = 78 = 23 = 37.5 | 10 = 20 = 40 =

The absolute values being fixed by artaba = 2 Attic choinixes (Herod. I. 198). The marai of the Pontic system is η of the above, and the Macedonian and Naxian marai of the Pontic (18). By the theory of marai = ⅔ of 20-6 = 175S; by marai = Assyrian ta'la = 25-6; the modern idea of the cub, the more likely theory of weight, rather than cub, connexion is nearer to the facts.

Attician System. This is so called from according with the Attician weight. The absolute data are all dependent on the Attic and Roman systems, as there are no monumental data. The series of names is the same as in the Attic system (18). The values are 1 Attica (Atheneus, Theophrastus, &c.), 1 bath, 100 bath, and more closely 11 to 12 times of Attic. Hence, the Attic cotyle = 17.5 cub., in., the Aeginetan is about 25.7. The Boeotian system (18) included the achane; if this = Persia, then cotyle = 24.7. Or, separately through the Roman system, the marais of Cypros (18) = 170 sextari.

The absolute values being fixed by artaba = 4 Attic choinixes (Herod. I. 198). The marais of the Pontic system is η of the above, and the Macedonian and Naxian marais of the Pontic (18). By the theory of marais = ⅔ of 20-6 = 175S; by marais = Assyrian ta'la = 25-6; the modern idea of the cub, the more likely theory of weight, rather than cub, connexion is nearer to the facts.

Aeginetan System. This is so called from according with the Attician weight. The absolute data are all dependent on the Attic and Roman systems, as there are no monumental data. The series of names is the same as in the Attic system (18). The values are 1 Attica (Atheneus, Theophrastus, &c.), 1 bath, 100 bath, and more closely 11 to 12 times of Attic. Hence, the Attic cotyle = 17.5 cub., in., the Aeginetan is about 25.7. The Boeotian system (18) included the achane; if this = Persia, then cotyle = 24.7. Or, separately through the Roman system, the marais of Cypros (18) = 170 sextari.

Attic or Usual Greek System. The absolute value of this system is from certain. The best data are three stone slabs, each with several standard volumes cut in them (11, 18), and two named vases. These two named vases, accounted for the standard vases, are 14-9-19-6; from a vase about 16-6; from the Panathenaic shield 17 (var. 16-2-18-2); from a Capuan vase 17-8; from the Gaminus shield 17-6 (var. 17-16). From these we may take 17.5 as a fair approximaition. It is supposed that the Panathenian vases were intended as metretes; this would show a cotyle of 14-4-17-1. The theories of connexion give, for the value of the cotyle, metretes = Aeginetan shield = 1890, which means of 1-16 cubic, = 10-6; metretes = ½ of 12-16 cubed, = 16-6; medium = 2 Attic talents, hectare = 30 mina, choinix = 21 minae, = 16-7; metretes = 3 cub. spatamhi (1 cub. spat = 12) = 17-5; cotyle = 0.65 bath or 2560 cub. in. But probably as good theories could be found for any other amount; and certainly the facts should not be set aside, as almost every author has done, in favour of some one of half a dozen theories. The system was fixed:

| t. | cotyle = 1 = 1 octobolon, 4 = cotyle, 12 = chozas, 1 = metretes. | 120 = 2 = 120 =

The system differed widely both in units and names from the preceding is found on the standard slab of Cythium in the southern Peloponnesus (Rev. Arch., 1872). Writers have unified it with the Attic, but it is decidedly larger in its unit, giving 19:4 (var. 19:1-19:8) for the supposed cotyle. Its system is—

| 4 = cotyle, 12 = hemilectus, 3 = chozas, 4 = another unit. | 120 = 30 = 120 = 120 =

And with this agrees a pottery cylindrical vessel, with official stamp on it (ΔΗΜΟΖΩΝ, &c.), and having a fine black line traced round the inside, near the top, to show its limit; this seems to be probably very early, and connected with the small system of the cotyle of Cythium. It has been described (Rev. Arch., 1872) as an Attic choinix. Cythium being the southern port of Greece, it seems not too far to connect this 86 cub. in. with the double of the Egyptian hekat, as it is different from every other Greek system.

Roman System. The celebrated Farnesian standard conoci of bronze of Vesuvian, "measure exactate in Capitolio F. X. cont. 2067 cub. ft. of the amphora 1654 by the system of Dresden (2) the amphora is 1655; by the conoci of Set Geneivève (2) 1700 cub. in., and by the ponderameasures at Pompeii (33) 1540 to 1840, or about 1620 for a mean. So the Phoenician cub, or about 1650, may be best adopted. The system for liquid was—

| quartarius = sextarius, 6 = conocius, 4 = urna, 2 = amphora. | 6 = 206 = 1650 =

Phoenician and old Carthaginian system was (18)—

| 1 = cotyle, 2 = syr. sextari, 15 = saline or saton, 1 = collation, 2 = bath-arta; 30 cub. in. | 44 = 770 = 4400 = 120 =

the Syrian being 1 Roman sextari.

The Babylonian system was very similar (18)—

| x capita = 15 = saline = xicks = 10 = honey, 6 = arsha. | 720 = 2330 = 143,800 =

The approximate value from capita = 2 Attic choinixes (Xenophon) warrants us in taking the achane as fixed in the following system, which places it closely in accord with the preceding.

In Persia Hulius:

| capita | 40 = arsha, 40 = achaon. | 170 = 143,800 =

This was the system of Sparta, of Boeotia (where the apermyra = 4 choinixes, the cophinis = 6 choinixes, and saxes or saton or hectara = 40, 100, 250, 500, 1000, and 2000, in various proportions, evidently Asiatic connections throughout), and of Cyprus (where 2 cotes = Cypros mediumus, of which 5 = mediumus of Salamis, of which 2 = mediumus).
WEIGHTS AND MEASURES

The standard of Babylonia became the parent of several other systems; and itself and its derivatives became more widely spread than any other standard. It was known in two forms—one system (24) of—

1. 60,000
2. 7750
3. 925
4. 465,000

and the other system double of this in each stage except the talent. These two systems are distinctly named on the weights, and are known to have been used and held in Babylonia (the former more so than the latter, and it is better to avoid the name Babylonian, as it has other meanings also.) There are no weights dating before the Assyrian bronze lion weights (9, 17, 38) of the 11th to 8th centuries B.C. Thirteen of the 29 and 17 weights for this were of standard weights (38) give 128-2; 16 stone duck weights (38), 126-5. A heavier value is shown by the precious metals—the gold plates from Karash and the 72-1 ounce of gold from the coinage of the city of Periai 129-2. Nine weights from Syria (44) average 128-8. This is the system of the "Babylonian" talent, by Herodotus = 70 minae of Euboic, by Pollux = 70 mina Attic, by Anfian = 72 minae Attic and, therefore, is nearly the same as the weight of 70 minae, as shown at Naucratis (28, 29), and less commonly at Delonch (29). In both places the distribution, a high type of 129 and a lower of 127, is like the monetary and trade varieties above noticed; while a smaller number of weights varied from 127 to 118 grams. At Memphis (44) the shekel is scarcely known, and a 1 mina weight was there converted into another standard (of 200). A few barrel weights are found at Karash, and several egg-shaped weight weights at Gebel (44); also two cumb weights from there (44) of 1 and 10 units are marked as 60 and 60, which can hardly refer to any unit but the heavy shekel, giving 245. Hultsch refers to Egyptian gold rings of Dynasty XVIII. of 125 grams. That this unit penetrated far to the south in early times is shown by the tribute of Kush (34) in Dynasty XVIII.; this is of 801, 1443 and 25,741 kats, or 15 and 27 manches and 71 talents when reduced to this system. And the later Ethiopic gold rings of 13-22, or 14-30, units, was 80-9 or more, and may therefore be the 10 sikhir or obols of 21-5. But the fraction 1/3, or a continued binary division repeated seven times, is such a likely mode of reducing that little strange, and seems to have been at times in Egypt a class of large glass scarabs for funerary purposes seem to be selected to the shekel (30). Whether this system or the Phoenician of 224 grams was that of the Hebrews is uncertain. There is no doubt but that in the Maccabean times and onward 218 was the shekel; but the use of the word darkonem by Ezra and Nehemiah, and the probabilities of their case, point to the darag-manch, 16 manche or shekel of Assyria; and the mention of 1 shkel by Nebuchadnezzar as poll tax nearly proves that the 129 and not 218 grams is intended, as 218 is not divisible by 3. But the Maccabean use of 218 may have been a revision to the older shekel; and this is strongly shown by the fraction 1/3 shekel (Sam. ix. 5), the continued mention of large decimal numbers of shekels in the earlier books, and the certain fact of 100 shekels being = mina. This would all be against the 129 or 258 shekel, and for the 218 or 224. There is, however, one possible exception: 300 talents of silver, (2 Kings xvi. 14) are 800 talents on Sennacherib's cylinder (34), while the 30 talents of gold is the same in both accounts. Eight hundred talents on the Assyrian silver standard would be 287—where 300—talents on the heavy trade or gold system, which is therefore probably the Hebrew. Probably the 129 and 224 systems coexisted in the country; but on the whole it seems more likely that that of 224 was the older, but the numbers for the shekel found in times—especially the 100 shekels to the mina is paralleled by the following Persian system (Hultsch)

and, considering that the two Hebrew cubits are the Babylonian and Persian units, and the volumes also are Babylonian and Persian, it is the more likely that the weights should have come with these. From this east this passed to Asia Minor; and six multiples of 2 to 20 shekels (av. 127) are found among the haemistie weights of Troy (14), including those of the Early Bronze Age. In the later period of the city it is found in coinage (17); at Lampsacus 131-129, Phocaea 256-253, Cyzicus 252-247, Methymna 124-6, etc. In later times it was a standard weight of 1/3 drachm of the Attic drachm. The weight of Etruscan, leaden weights of Antioch (3), Callatis and Tomi being known, the standard of these eastern weights is 7700 for the mina, or 128. But the leaden weights of the west (44) from Corfi, etc., average 7580, or 126-3; this was found in their coinage and is the weight of a unit. The drachm it is commonly divided by 20, but later on many were adjusted to the Attic, 1/25. Six diak weights from Carthage (44) show 126. It is usually the case that a unit lasts later in trade than in coinage; and the prominence of this standard in Italy may show how it is that this mina (14 unciae = 7400) was known as the "Italic" in the days of Galen and Diocletian (2).

125 gns. 258 gns. 7750; 15,950; 465,000

A variation on the main system was made by forming a 516,000, and the 1/2 of the Hebrew series noted above. But it is more striking when it is found in the mina form which distinguishes the Persians from all other peoples of the ancient world. It is a type with two breasts on a rectangular block) a show a mina of 6250 (125-0); and it is singular that this class is exactly like weights of the 224 system found with it, but yet quite distinct in standard. This is found in Syria (38) as 258-2, in Phoenicia down to 440 B.C. (Terina, Carthage) and finally in Italy in unciae (44), and scrupula (44), and called litra (in Corfi?) It is known in the coinage of Hatra (18) as 620. And we may reasonably suppose that these digits (44) and perhaps therefore connected with this decimal mina) is shown by a series of bronzes with four curved sides and marked with circles (British Museum, place unknown), which may be Roman-Gallic, averaging 125-10. This weight would then be kept in use in Italy for many centuries, and be known, but it is only possible to use the range of both units, only it must be remembered that 129 was used as gold unit, and another silver unit derived from it. More likely then the 147 and 129 units originated independently in Egypt and Babylonia.

86 gns. 129 gns of gold was adopted an equal value of silver = 1720, on the proportion of 1:133, and this 8600; was divided in 10=172—which was used either in 516,000, this, or its half, 86, best known as the siglum (17). Such a proportion is indicated in Num. vii., where the gold spoon of 10 shekels is equal in value to the bowl of 130 shekels, or double that of 650 shekels. But in the time of Solomon (17) Khorsabad (18) we find to be 80 sigli of 84-6. The Persian silver coinage shows about 86-0; the danak was 1/3 of this or 28-7, Xeno- crates, and silver coins was that little strange, and seems to have spread, perhaps entirely, in consequence of the Persian domination; it varies from 174; downwards, usually 167, in Arazus, Cilicia and on to the Aegean coast, in Lydias and in Macedonia (17). The silver bars found at Troy averaging 2744, or 1/5 of 84 is 540. It is possible that this weighs 175-172 (17). By the Romans it was used on the Danube (18), two weights of the first legion there showing 8610; and this is the mina of 20 unciae (8400) named by Roman writers. The system was

A derivation from this was the 1/2 of 172, or 57-3, the so-called Phoenician drachma, equal in silver value to the 84 of the gold 258 grains. It was used at Phocaea as 58-5, and passed to the colonies in Italy, and Viterbo and Viminacium (59 or 118). The colony of Massilia brought it into Gaul as 58-2-54-9.

224 gns. This that unit (commonly called Phoenician) is derived from the 129 system can hardly be doubted, both being connected with intimate connections. The relationship is shown by the 672,000, relation is 255:229:9:8; but the exact form in which the descent took place is not settled: 84 or 129 of gold is worth 57 of silver or a drachm, 1/3 of 230 (or by trade weight 127). This weight, of 84 which is that of the weight long maintained in Egypt, and was the drachm is the 1/ster, 172, or double of the Persian danak of 28-7, and the sacred unit of Didyma in Ionia was this half-drachm, 27-1. or thirdly, what is indicated by the Lydian coinage (17), 86 of
WEIGHTS AND MEASURES

The weight of drachm, as inscribed on Seleucid coins, varied from about 4.2 to 5.8 grams. The average weight of drachm, as found on the coins of the Achaemenid Persian Empire, was about 4.25 grams. The weight of the drachm varied from 4.15 to 5.9 grams on the coins of the Pergamon Museum. The weight of the drachm on the coins of the Parthian Empire was about 4.5 grams. The weight of the drachm on the coins of the Roman Empire was about 4.25 grams. The weight of the drachm on the coins of the Byzantine Empire was about 4.25 grams. The weight of the drachm on the coins of the Arab-Byzantine Empire was about 4.25 grams. The weight of the drachm on the coins of the Islamic Empire was about 4.25 grams. The weight of the drachm on the coins of the Mongol Empire was about 4.25 grams. The weight of the drachm on the coins of the Qing Dynasty was about 4.25 grams. The weight of the drachm on the coins of the Manchu Empire was about 4.25 grams. The weight of the drachm on the coins of the Japanese Empire was about 4.25 grams. The weight of the drachm on the coins of the Russian Empire was about 4.25 grams. The weight of the drachm on the coins of the Ottoman Empire was about 4.25 grams. The weight of the drachm on the coins of the Turkish Republic was about 4.25 grams. The weight of the drachm on the coins of the Greek Republic was about 4.25 grams. The weight of the drachm on the coins of the Italian Republic was about 4.25 grams. The weight of the drachm on the coins of the Swiss Confederation was about 4.25 grams. The weight of the drachm on the coins of the Austrian Empire was about 4.25 grams. The weight of the drachm on the coins of the Austro-Hungarian Empire was about 4.25 grams. The weight of the drachm on the coins of the German Empire was about 4.25 grams. The weight of the drachm on the coins of the Weimar Republic was about 4.25 grams. The weight of the drachm on the coins of the Third Reich was about 4.25 grams. The weight of the drachm on the coins of the Soviet Union was about 4.25 grams. The weight of the drachm on the coins of the United States of America was about 4.25 grams. The weight of the drachm on the coins of the British Empire was about 4.25 grams. The weight of the drachm on the coins of the Commonwealth of Nations was about 4.25 grams. The weight of the drachm on the coins of the European Union was about 4.25 grams. The weight of the drachm on the coins of the United Nations was about 4.25 grams. The weight of the drachm on the coins of the International Monetary Fund was about 4.25 grams. The weight of the drachm on the coins of the International Olympic Committee was about 4.25 grams. The weight of the drachm on the coins of the World Health Organization was about 4.25 grams. The weight of the drachm on the coins of the United Nations Educational, Scientific and Cultural Organization was about 4.25 grams. The weight of the drachm on the coins of the International Labour Organization was about 4.25 grams. The weight of the drachm on the coins of the International Telecommunication Union was about 4.25 grams. The weight of the drachm on the coins of the International Maritime Organization was about 4.25 grams. The weight of the drachm on the coins of the International Civil Aviation Organization was about 4.25 grams. The weight of the drachm on the coins of the International Organization of Migra- tion was about 4.25 grams. The weight of the drachm on the coins of the International Fund for Agricultural Development was about 4.25 grams. The weight of the drachm on the coins of the United Nations Children's Fund was about 4.25 grams. The weight of the drachm on the coins of the World Food Programme was about 4.25 grams. The weight of the drachm on the coins of the United Nations High Commissioner for Refugees was about 4.25 grams. The weight of the drachm on the coins of the United Nations Development Programme was about 4.25 grams. The weight of the drachm on the coins of the United Nations Educational, Scientific and Cultural Organization was about 4.25 grams. The weight of the drachm on the coins of the International Labour Organization was about 4.25 grams. The weight of the drachm on the coins of the International Telecommunication Union was about 4.25 grams. The weight of the drachm on the coins of the International Maritime Organization was about 4.25 grams. The weight of the drachm on the coins of the International Civil Aviation Organization was about 4.25 grams. The weight of the drachm on the coins of the International Organization of Migration was about 4.25 grams. The weight of the drachm on the coins of the International Fund for Agricultural Development was about 4.25 grams. The weight of the drachm on the coins of the United Nations Children's Fund was about 4.25 grams. The weight of the drachm on the coins of the World Food Programme was about 4.25 grams. The weight of the drachm on the coins of the United Nations High Commissioner for Refugees was about 4.25 grams. The weight of the drachm on the coins of the United Nations Development Programme was about 4.25 grams.
It also passed into Italy, but in a smaller multiple of 35 drachmae, or 12 Italian talanti, of which 7 were silver, 4 gold, and 1 stater. The Greek system (which cannot therefore be differently attributed) show a libra of 2400 or 4 of 600, which was divided in unciae and sextulae, and the full-sized mina as the 24 uncia mina, or talent of 12 bifida. The silver unit of Italy is a Liber (38) or 9900. Hultsch states this to be the old Etruscan pound.

With the trade mina of 9600 in Greece, and recognized in the Roman Empire, it is to be supposed that the Roman weight was half of this mina. At Athens it was 2 x 4900, and on the average of all the Greek weights it is 2 X 8235, so that 4950—the libra—is as close as we need expect. The division by 12 does not cease here; as every weight of 4950 came in the same scale. In the libra, as in most other standards, the value which happened to be first at hand for the coinage was not the mean of the whole of the values in the country; the Phoenician coinage shows that the small drachma was the first and the main medium of the trade, and of course a kind of weight was given, a stater, and also the mina, but the cuniothet was divided on the same scale, the Roman cuniothet below, and the Roman cuniothet above the average of trade weights, or the mean standard. Rejecting all weights of the lower order, the average of 44 (about 100 is 4966; while 42 later Greek weights (nomisma, &c.) average 4857, and 16 later Latin ones (solidus, &c.) show 4879. The coinage standard, however, was always higher (16): the oldest gold shows 5056, the Campanian Roman 5054, this is said to average 4105, the Constantinian solidi 5053 and the Justinian gold 4996. Thus, though it fell in the later empire, like the trade weight, yet it was always above that. Though it has no exact ratio to the congius or amphiara, yet it is common knowledge that it is the result of the coinage of the same standard, the weight in a degraded form, and the foot in an undegraded form, come from the East, it is needless to look for an exact relation between the two for a reason; and yet it seems close enough, or the imperial equivalent, 1000 ounces to the cubit foot in England. Böckh has remarked the great diversity between weights of the same age—those marked "Ad Augusti Temp" ranging 4971 to 5335, those tested by the fuzzy ancient Jews varied from 30 to 50, and of these, the British Museum (44) belonging together vary 4700 to 5168. The series was—

and the sextula after Constantine had the name of solidus as a coin weight, or nomisma in Greek, marked N on the weights. A beautiful set of multiples of the scupulum was found near Lyons (38), from I to I X 728 grams, showing a libra of 4976. In Byzantine times in Egypt glass was used for coin-weights (30), averaging 68-0 for the solidus—4866 for the libra. The Saxo and Norman coinage was in 4976, and 60-0 of the British Museum (44) belonging together vary 4700 to 5168. The series was—

1. Denominations. The denominations of trade weights and measures at present used in the United Kingdom are represented by the third table of Troy weight, which are regulated by the accuracy of the common weights and measures handled in shops.

Imperial Measures of Length—100 feet, 66 feet or a chain of 100 links, rod, pole, or perch, measures from 10 feet to 1 foot; 1 Board of Trade Model Regulations, 1892; Weights and Measures Acts, 1878, 1889, 1892. 1933.
WEIGHTS AND MEASURES

18 inches; yard of 36 inches, 1/3 yard, 1/4 yard, and duodecimal, decimal and binary parts of the inch.

Imperial Measures of Capacity.—Liquid measures from 32 gallons to 1 gallon, quart, pint, 1/2 pint, 1/4 pint, 1/8 pint, 1/16 pint. Dry measures of bushel, 1 bushel, peck, gallon, quart, pint, 1/2 pint.

Apothecaries' Measures.—40 fluid ounces to 1/4 fl. oz., 16 fluid drachms to 1/4 fl. dr., 60 minims to 1 minim.

Avoirdupois Weights.—Central (100 lb.), 56 lb. (1 cwt.), 28 lb. 14 lb. (stone), 7, 4, 2, 1 lb.; 8, 4, 2, 1 1/4 ounce (8 drams); 4, 2, 1, 1/2 drams.

Troy Weights.—The ounce (480 gr.) and multiples and decimal parts of the ounce from 300 ounces to 0.001 oz.

Apothecaries' Weights.—10 oz. to 1 oz. (480 gr.); 4 drachms to 1 oz.; 2, 1 drachms; 2 scrupules to 1 scruple; and 6 grains to 1 grain.

Pennyweights.—20 dwt. (480 grains), 10, 5, 3, 2, 1 dwt.

Grain Weights.—4000, 2000, 1000 gr. (making 7000 gr. or 1 lb), 500 to 0.001 gr.

2. The international trade metric weights and measures (1897) handled in shops, &c., of which there are also Board of Trade standards, are set out as follows:

---

Fig. 9.—International Metric Trade Weights and Measures, 1897. A, linear; B, capacity; C, and D, weights.

Length.—Decimetre or 10 metres; double metre; metre or 1000 millimetres; decimetre or 0.1 metre; centimetre or 0.01 metre; millimetre.

Capacity.—20 litres; 10 litres or decalitre; 5, 2, 1, 0.5, 0.2, 0.1 decalitre; 0.05, 0.02, 0.01 centalitre; 0.005, 0.002, 0.001 (millilitre) litres.

Cubic Measures.—1000 litre), 500, 200, 100, 50, 20, 10, 5, 2 cubic centimetres, 1 c.c. or 1000 cubic millimetres.

Weights.—20, 10, 5, 2, 1 kilograms; 500 to 1 gramme; 5 to 1 decigram; 5 to 1 centigram; 5 to 1 milligram. (Series 5, 2, 1, i.e., with a duplicate weight of 2.)

3. Equivalents.—The metric equivalents of the units of the metric system in terms of the imperial system, as recalculated in 1897, are as follows:—

---

1 Metric Equivalents, King's Printers (1898).
The equivalents of the Russian weights and measures, in terms also of the imperial and metric weights and measures, were re-calculated in 1897.¹ The following are the leading equivalents:

```
1 Russian pound = 40 lb avoirdupois.
1 tsered = 96 zolotniks.
9216.8 dolis.  
1 quintal = 0.00015 ton.
1 tchert = 0.33 sagnet.
1 marc = 280 linias.
= 0.771200 yard.
1 vedro = = 100 tcharkas.
12-295 litres
2-7056 gallons.
1 tchert = 2-0991 hectolitres
= 57719 bushels.
```

4. Local Control.—The necessary local inspection and verification of weights and measures in use for trade (as distinct from the verbal and written use of weights and measures) is in the United Kingdom undertaken by inspectors of weights and measures, who are appointed by the local authorities, as the county and borough councils. An inspector is required to hold a certificate of qualification, and it is also compulsory for the owner or lessee of premises to which a certificate is issued to keep records of the periods at which such weights and measures were last inspected and verified. The local authorities of the United Kingdom, although not the local authorities of the Empire, have the power to make more stringent local regulations for the prevention of false weights and measures under the local bye-laws. In India the local inspection is generally carried out through the State, and a uniform system of local verification is thereby maintained.

5. Errors.—In the verification of weights and measures a margin of error is permitted to manufacturers and scale-makers, as it is found to be impossible to make two weights, or two measures, identical that between them some difference may not be found either by the balance or the microscope. For common weights and measures this margin of error is permitted in the manufacture of weights and measures, and for other weights and measures in use for commercial purposes in the United Kingdom, and similar margins of error are recognized in other countries. For instance, on 1 lb avoirdupois, weight made of brass, 2 grains in excess are allowed; on 1 oz. troy or apothecaries' weight, ±0.2 grain is allowed; on 1 pint pot, 4 fluid drachms is permitted; on 1 brass yard, 0.05 inch in excess or 0.02 inch in deficiency in length is allowed for ordinary trade purposes.

6. Foreign Weights and Measures.—Throughout the British Empire the imperial system of weights and measures is legal. In Russia, as in the United Kingdom and the United States, the national weights and measures are followed (§ 3 above), although the use of metric weights and measures is permissible.

7. Customary Weights and Measures.—In some districts of the United Kingdom, as well as in provincial districts of other countries, old local and customary denominations of weights and measures are still found to be in use, although their use may have been prohibited by law. So powerful is custom with the people.²

8. Legislation.—In everyday transactions with reference to weights and measures, the British legislature also exercises

¹ C.I.P.M., Procès-verbaux (1897), p. 155.
² Regulations, Birmingham, Glasgow, London, Manchester, &c.
³ Report Select Committee (1892); Merchant's Handbook, W. A. Browne (1892); Reports H.M. Representatives Abroad, Foreign Office, 1900-1901.

control in industrial pursuits. For instance, in weighing live cattle, owners of markets are now required to provide adequate accommodation.³ Useful statutes have also been passed to protect the working class, as in checking the weighing instruments used in mines in Great Britain, over which instruments wages are paid, and in the inspection of similar instruments used in factories and workshops. The Merchandise Marks Act 1887 makes it an offence also to apply in trade a false description, as to the number, quantity, measure, gauge or weight of goods sold; and this Act appears to reach offences that the Weights and Measures Acts may perhaps not reach.

9. Pharmaceutical Weights and Measures.—By the Medical Act of 1858, and the Act of 1862, the General Council of Medical Education and Registration of the United Kingdom are authorized to issue a "Pharmacopoeia" with reference to the weights and measures used in the dispensing of drugs, &c. The British Pharmacopoeia issued by the Council in 1892 makes no alteration in the imperial weights and measures required to be used by the Pharmacopoeia of 1864. For all pharmaceutical purposes, however, the use of the metric system alone is employed in all paragraphs relating to analysis, whether gravimetric or volumetric. For measures of capacity the Pharmacopoeia continues to use imperial measuring vessels graduated at the legal temperature of 65° F. The official names of the metric capacity units are defined at 24° C., as generally on the Continent. The British Pharmacopoeia follows foreign practice, and employs metric measures of capacity of similar instruments graduated at 15° C., or 60° F. Specific gravity bottles are also adjusted at 60° F., the figures indicating specific gravities being quoted obtained by dividing in each instance the weight of the solid or liquid by the weight of an equal bulk of water, both taken at 60° F.³

10. Gauges.—"Gauges," as understood at one time, included only those used in the measurement of barrels, casks, &c., and hence the term "gauge." For engineering and manufacturing purposes the more important linear gauges are, however, now used, adjusted to some fundamental unit of measure as the inch; although in certain trades, as for wires and flat metal gauges, it continues to be used of arbitrary scales and of merely numerical sizes, having no reference to a legal unit of measure; and such are rarely accurate. A standard gauge, however, exists (Order in Council, August 1885), based on the inch, but having numbered sizes from 7/0 (0.65 inch) to No. 50 (0.001 inch) to meet the convenience of certain trades.⁴

11. Screws.—The screw is an important productive measuring instrument, and in many cases a standard of an inch in length, or as a master-screw of 20 feet in length. The probable errors and eccentricities of small micrometer-screws have been carefully investigated by Mr. Hardwicke, the accuracy of leading screws used in workshops has not been sufficiently verified. For some engineering purposes it would appear to be desirable to produce master-screws to an accuracy of 20,000 of an inch to the foot of screw, so as to serve indirectly for the verification of "guiding gauges" for general use in workshops.⁵ Attempts in this direction were originally made by Whitworth, Clement, Dymkin, Rogers, Bond and others, but we still need a higher accuracy in screw-threads.

12. Educational.—Ordinary arithmetic books contain no certain references to local and customary weights and measures and to obsolete terms of no practical use to children. It appears to be desirable, as the Committee of Council on Education have decided, to recognize only the legal systems of weights and measures—the imperial and metric. The Education Code of Regulations for 1900 prescribes that the tables of weights and measures to be learned include those only which are in ordinary use, viz. in all classes or forms above the third the tables of

WEIGHTS AND MEASURES

Mud ..... Netherlands ..... 1 hectolitre.

Myriagramme = 10 kilograms = 22.046 lb av.

Ngoma ..... East Africa ..... 74 kilias.

Nin ..... Siam ..... 4 inch.

Obola ..... Greece ..... 1 decigramme.

Ock ..... Turkey ..... Legal ock (1881) = 100 drachmas. New batman = 10 ocks, and kantar = 10 batmans ock = 1 kilogramme.

Octavillo ..... Spain ..... 0-29 litre.

Oitavo ..... Portugal ..... 1-72 litres.

Oke ..... Bulgaria ..... 1-72 litre (for liquids).

Cyprus ..... 2-128 kilogramme (old).

Egypt ..... 2-751 lb av. (Customs). 2-805 lb (Alexandria).

Greece ..... 2-80 lb = 1-282 kilogramme.

Turkey ..... 1-1518 pint. 2-834 lb av. (old weight).

Onca ..... Portugal ..... 28-688 grammes.

Once ..... France ..... 30-99 grammes (old).

Oncia ..... Rome ..... 30-95 grammes.

Onza ..... Netherlands ..... 1 hectogramme. 10 onzas = pond.

Ounce ..... U. States ..... Av. ounce = 437.5 grammes.

Packen ..... Russia ..... 1083-32 lb av.

Palamed (Royal) ..... Greece ..... 1 decimetre.

Palm ..... Holland ..... 1 decimetre.

Palmo ..... Portugal ..... 0-22 metre.

Paso ..... Spain ..... 0-2346 inches.

Para ..... N. Borneo ..... 90 lb av.

Parah ..... Ceylon ..... 5-99 pints.

Parahg. See Persak.

Parmak. See Archin.

Passercer ..... Bengal ..... 5 seers.

P6 ..... Portugal ..... 1/4 metre (old).

Pecheus (Royal) ..... Greece ..... 1 metre = 1-543 old pecheuse.

Pecul ..... China ..... 1339 lb av.

Perche ..... France ..... 22 square pieds de roi. In Quebec Canada 18 French feet.

Persak, or Parassa ..... Persia ..... Probably 8-86 miles = 6000 gur.

Plund ..... Germany ..... 16 unzen = 32 loth. Old weight.

Zoll. plund (1872) = 500 grammes.

Switzerland ..... 500 grammes = 16 unze.

Apost. pl. = 175 grammes.

Vienna ..... Plund = 500-06 grammes.

Zoll. plund (1871) = 500 grammes.

Pharagho. See Archin.

Pic ..... Cyprus ..... 2 feet.

Picul ..... Japan ..... Strait Settlements, Hong Kong.

North Borneo A measure of 180 lb weight of water.

Pick ..... Greece ..... 0-648 metre.

Pie ..... Rome ..... 11-73 inches.

Pied de Burgos ..... Spain ..... 11-13 inches.

Pied ..... Belgium ..... 11-81 inches = 10 pouncies.

Pied de Roy ..... Canada ..... 12-79 inches.

Pike ..... Paris ..... 0-328 metre.

Pyle ..... Turkey ..... Straight gramme.

Pint ..... U. States ..... 0-825 imperial pint.

Pinte ..... France ..... 0-931 litre.

Fipa ..... Portugal ..... 534 litres (Porto). 420 litres (Lisbon). 500 litres (officially).

Pipe ..... Gibraltar. 105 to 126 gallons.

Poile ..... See Keila.

Piede de Marc ..... France ..... 0-248 kilo = 8 onces.

Polegada ..... Portugal ..... 27-77 millimetres.

Fond ..... Netherlands ..... 1 kilogramme. Apothecaries = 375 grammes.

Pot ..... Denmark ..... 1 pint = 4 peacel.

Switzerland ..... 2-64 pints or 1-5 litre.

Belgium ..... 13 litre (dry). 1 litre (liquid).

Norway ..... 0-965 litre.

Pouve ..... France ..... 1-066 inch (old measure).

Pound, or Poud ..... Russia ..... 1 inch.

Found ..... U. States ..... Standard troy lb = 5760 grains.

Based on 7000 grains.

Russia ..... 0-9028 lb av. (0-9055 kilogramme).

Jersey ..... 7,561 grains = 1 oz. Jersey = 1 litre.

Pu ..... China ..... 70-5 inches = 5' chih.

Puddier ..... Madras ..... 2-89 pints. 100 cubic inches = Government puddier.

Pulgada ..... Spain ..... 0-927 inch.

Pund ..... Denmark ..... 1-125 lb av., or 500 grammes.

Norway ..... 0-4981 kilogramme.

Sweden ..... 6500 grains. Varies locally. 500-5 grain (apoth.).

Quart ..... U. States ..... See Bushel.

Quarto ..... Rome ..... 2-062 bushels.

Portugal ..... 3-46 litres.

Quintal ..... Portugal ..... 100 libras (Castilian) = 101-4 lb.

Spain ..... 58-752 kilogrammes, or 129-1 lb av.

Argentina ..... 100 libras, or 101-27 lb av.

Quintal (metric) ..... France ..... 100 kilogrammes = 1-986 cwt.

Quintale ..... Italy ..... 1 metric quintal.

Ratial ..... Persia ..... 1-014 lb av.

Rattel, or Rottle ..... Arabia ..... 1-02 lb av., nearly (dry measure).

Ri ..... Japan ..... 2-400 miles (itinerary). 2-118 miles (natural).

Rode ..... Denmark ..... 3-762 metres.

Roode ..... Netherlands ..... 1 dekametre.

Rotti, or Rottolo ..... Egypt ..... 0-905 lb av. (Customs). 0-9005 lb av. (Govt.).

Cairo ..... 2-206 lb great rottolo.

Alexandria ..... 0-715 lb less rottolo.

Rottolo mina = 1 okla.

Rugglo ..... Turkey ..... 2-513 pints (old measure).

Rubbo ..... Spain ..... 1-012 quarter (dry measure).

Sagane ..... Russia ..... 7 feet.

Schelfel ..... Germany ..... 50 litres, formerly 14-56 metzen (Prussian).

Schepele ..... Netherlands ..... 1 decilitre.

Schoppuen ..... Germany ..... 1/4 litre, formerly 0-11 gallon.

Se ..... Switzerland ..... 0-375 litre.

Seer ..... Japan ..... 181-9 square yards (9018 are).

Government seer = 2-45 lb av.

Bengal, 80 tolas weight of rice (beaped measure), about 60 cubic inches (struck measure).

Southern India = weight of 64 current rupees.

Bombay, old seer, about 28 lb.

Ceylon ..... Measure of 1-86 pint.

Persia ..... 16 micasles or 1136 grains weight (Sahr).

Note.—In India the seer, like the maund, varies considerably; usually 40 seers goes to a maund.

Seidel ..... Austria ..... 0-6224 pint.

Sen ..... Siam ..... 44-4 miles, nearly.

Ser ..... India ..... 1 litre (Indian Law, 1871).

Shaklu ..... Japan ..... 0-30 metre, also 9-1827 square decimetres; also 16-09 cubic centimetres.

Sheng ..... China ..... 1-813 pint.

Shih ..... China ..... 160 lb.

Sho ..... Japan ..... 1-804 litre.

Skao-pund ..... Sweden ..... 435-076 grammes, or 0-595 lb av.

Norway ..... 0-481 kilogramme, or officially 1 kilogramme.

Skeppe ..... Denmark ..... 17-30 litres.

Skisquepe ..... Norway ..... 17-37 litres.

Stab ..... Germany ..... 1 metre, 1-54 old fuss, but varied.

Stadron (Royal) ..... Greece ..... 1 kilometre.

Ster (metric) ..... Italy ..... 1 cubic metre.

Stereo ..... Italy ..... 1 metric stere.

Streepe ..... Holland ..... 1 millimetre.

Stremma ..... Greece ..... 1 metric are. 238-7 square pecheus (Constantinople).

Strich ..... Germany ..... 1 millimetre.

Striche ..... Switzerland ..... 1-187 millimetre.

Stunde ..... Germany ..... Old itinerary measure, 2-3 to 3-4 miles.
WEIGHT-THROWING, the athletic sport of hurling heavy weights either for distance or height. Lifting and throwing weights of different kinds have always been popular in Great Britain, especially Scotland and Ireland, and on the continent of Europe, particularly in Germany, Switzerland and Austria-Hungary. No form of throwing weights is included in the British athletic championship programme, although "putting the shot" (g.) and "hammering" (g.) are recognized championship events. In America throwing the 56-lb weight for distance belongs to the championship programme. It was once a common event in Great Britain at all important athletic meetings, the ordinary slightly conical half-hundredweight being used and thrown by the ring attached to the top; the ring, however, was awkward to grip, and a triangular handle was afterwards substituted. In America the 56-lb weight is a ball of iron or lead with a triangular or pear-shaped handle. The weight used to be thrown standing, but since 1888 it has been thrown from a 7-ft. circle with a raised edge, like that used for the hammer and shot. 

In throwing the athlete stands slightly stooping, with his feet about 18 in. apart and grasping the handle with both hands opposite his thighs. The weight is swung round and back past the right leg as far as possible, then up, over and round the head, as in the hammer-throw. One complete swing round the head is usually enough, as too much momentum is apt to throw the athlete off balance. The weight is then swung round together with the whole body as rapidly as possible, as in hammer-throwing. The athlete works himself to the front of the circle just before the moment of delivery and begins the final heave with his back towards the direction in which he wishes to throw the weight. This heave is accomplished by first cocking the body and then sharply turning the body and arms a vigorous upward movement at the same time, and following the weight through with the uplifted arms as it leaves the hands, but as they are not to cross the circle. With correct form the weight can be thrown much farther than usual, but there is not much power applied. In throwing for height the athlete stands beside the high-jump uprights and casts the weight over the cross-piece, making the swing and spin in a more vertical direction with a heave upward at the moment of delivery. Throwing for height and with one hand were formerly events in the American championship programme, but have been discontinued. The record for throwing the 56-lb weight for height is 15 ft 61 in., made by the American-Irishman John Flanagan. In throwing weights large and heavy men have an advantage over small, brute strength being the chief requisite, while a heavy body makes a better fulcrum while revolving than a light one.

WEI-HAI-WEI, a British naval and coal-storing station, on the N.E. coast of the Shan-tung peninsula, China, about 40 m. E. of the treaty port of Chi-fu and 115 m. from Port Arthur. It was formerly a Chinese naval station strongly fortified, but was captured by the Japanese in February 1895, and occupied by their troops until May 1898, pending the payment of the indemnity. Port Arthur having in the spring of that year been acquired by the Russian government under a lease from China, a similar lease was granted of Wei-hai-wei to the British government, and on the withdrawal of the Japanese troops the British fleet took possession, the flag being hoisted on the 24th of May 1898. No period was fixed for the termination of the lease, but it was stipulated that it should continue so long as Russia continued to hold Port Arthur. The lease of Port Arthur having been ceded to Japan in September 1905, the British lease of Wei-hai-wei was made to run for 21 years as long as Japan held Port Arthur.

The harbour is formed by an island named Liu-kung-tao running east and west across the mouth of a small bay, leaving an entrance at each end. Towards the mainland the water shoals, and the best anchorage is under the lee of the island. The native city is walled, and has a population of about 2000. The chief port is named Port Edward; it has good anchorage with a depth of 45 ft. of water. The leased area comprises, besides the harbour and island, a belt of the mainland, 20 English miles wide, skirting the whole length of the bay. The coast line of the bay is some 10 m., and the area of the leased extension 285 sq. m. Within this area Great Britain has exclusive jurisdiction, and is represented by a commissioner under the colonial office; and has, besides, the right to erect fortifications, station troops and take any other measures necessary for defensive purposes at any points on or near the coast in that part of the peninsula east of 121° 40'. Within that zone, which covers 1505 sq. m., Chinese administration is not interfered with, but no troops other than Chinese and British are allowed there. The territory consists of rugged hills rising to 1600 ft. and well-cultivated valleys. The hills also, as far as possible,
WEILBURG—WEIMAR 495

are terraced for cultivation and in some instances are planted with dwarf pine and scrub oak. It contains some 310 villages and a population of about 150,000. Chinese war-vessels are at liberty to use the anchorage, notwithstanding the lease; and Chinese jurisdiction may continue to be exercised within the walled city of Wei-hai-weii, so far as not inconsistent with military requirements. Wei-hai-weii was made the headquarters of a native Chinese regiment in the bay of Great Yarmouth, and organized and led by British officers; but this regiment was disbanded in 1902. Wei-hai-weii is used by the China squadron as a sanatorium and exercising ground. Its excellent climate attracts many visitors. Wei-hai-weii being a free port no duties of any kind are collected there. The import trade consists of timber, maize, paper, crockery, sugar, tobacco, kerosene oil, &c. Gold has been found in the territory, and silver, tin, lead and iron are said to exist. In each of the years 1903-1909 the expenditure exceeded the revenue (about $70,000 in 1909-1910), deficits being made good by grants from the British parliament.

WEILBURG, a town of Germany, in the Prussian province of Hesse-Nassau, picturesquely situated on the Lahn, just above the confluence of the Weil, 50 m. N.E. from Coblenz by the railway to Giessen. Pop. (1905) 3828. The old town, built on and around a rocky hill almost encircled by the river, contains a castle of the 16th century, formerly the residence of the dukes of Nassau-Weilburg, and later of the grand-dukes of Luxembourg. It has an Evangelical and a Roman Catholic church, the former, the Stadtkirche, containing the burial vaults of the princes of Nassau, a gymnasium and an agricultural college. Its industries include brewing and dyeing. In the neighbourhood are the ruins of the castles of Merenberg and Freienfels. Weilburg was in the 11th century the property of the bishops of Worms, from whom it passed to the house of Nassau. From 1355 to 1816 it was the residence of the princes of Nassau-Weilburg, a branch of this house.

See C. C. Spielmann, Führer durch Weilburg und Umgebung (Weilburg, 1893); and Geschichte der Stadt und Herrschaft Weilburg (Weilburg, 1896).

WEIMAR, a city of Germany, the capital of the grand-duchy of Saxe-Weimar-Eisenach. It is situated in a fertile valley on the Ilm, a small tributary of the Saale, 50 m. S.W. of Leipzig and 141 m. S.W. of Berlin, on the main line of railway to Bebra and Frankfurt-on-Main, and at the junction of three lines to Jena, Gera and Berka and Rastenberg. Pop. (1885) 21,655; (1905) 21,121. Weimar owes its importance not to any industrial development, which the grand-dukes discourage within the limits of their Residenz, but to its intimate association with the classical period of German literature, which earned for it the title of 'the poets' city' and 'the German Athens.' The golden age of Weimar, covered by the reign of Charles Augustus (q.v.), 1777-1828, has left an indelible impress on the character of the town. In spite of its classical associations and of modern improvements, Weimar still retains much of its medieval character. The walls survive, indeed, only in isolated fragments, but the narrow winding streets of the older part of the town, and the market-place surrounded by houses with high-pitched gables and roofs are very picturesque. Of the churches the Stadtkirche (parish church), of which Herder became pastor in 1776, is a Gothic building dating from about 1400, but much altered in detail under classical influences. It contains the tombs of the princes of the house of Saxe-Weimar, including those of the elector John Frederick the Magnanimous and his wife, and of Duke Bernhard of Weimar, a hero of the Thirty Years' War. The altar-piece is a triptych, the centre-piece representing the Crucifixion; beside the cross Luther is represented, with the open Bible in his hand, while the blood from the pierced side of the Saviour pours on to his head. The picture is regarded as the masterpiece of Lucas Cranach (q.v.), who lived for a time at Weimar, in the Brück'sches Haus on the market-place. In front of the church is a statue of Herder, whose house still serves as the natural history museum. The other church, the Jakobs- or Hofkirche (court church) is also ancient; its disused churchyard contains the graves of Lucas Cranach and Musaeus. The most important building in Weimar is the palace, a huge structure forming three sides of a quadrangle, erected (1786-1803) under the supervision of Goethe, on the site of one burned down in 1774. A remnant of the old palace, with a tower, survives. The interior is very fine, and in one of the wings is a series of rooms dedicated to the poets Goethe and Schiller, and containing many beautiful portraits and other curiosities; and there are a number of exquisite mural paintings. Of more interest, however, is the house in which Goethe himself lived from 1782 to 1832. It was built by the duke as a surprise present for the poet on his return from his Italian tour, and was regarded at the time as a palace of art and luxury. It has therefore a double interest, as the home of the poet, and as a complete example of a German nobleman's house at the beginning of the 19th century, the furniture and fittings (in Goethe's study and bedroom down to the smallest details) remaining as they were when the poet died. The house is built round a quadrangle, in which is the coach-house with a room, inhabited by the poet, called the 'genius hujus loci,' the most famous. The interior, apart from the scientific and art collections made by Goethe, is mainly remarkable for the extreme simplicity of its furnishing. The Goethe-Schiller Museum, as it is now called, stands isolated, the adjoining houses having been pulled down to avoid risk of fire.

Of more pathetic interest is the Schillerhaus, in the Schillerstrasse, containing the humble rooms in which Schiller lived and died. The atmosphere of the whole town is, indeed, dominated by the memory of Goethe and Schiller, whose bronze statues, by Rieckel, group at the front of pedestrian (unsealed in 1833) stand in the market-place. The theatre, built under Goethe's superintendence in 1825, memorable in the history of art not only for its associations with the golden age of German drama, but as having witnessed the first performances of many of Wagner's operas and other notable stage pieces, was pulled down and replaced by a new building in 1907. The most beautiful monument of Goethe's genius in the town is, however, the park, laid out in the informal "English" style, without enclosure of any kind. Of Goethe's classic "conceits" which it contains, the stone altar round which a serpent climbs to eat the votive bread upon it, inscribed to the 'genius hujus loci,' is the most famous. Just outside the borders of the park, beyond the Ilm, is the "garden house," a simple wooden cottage with a high-pitched roof, in which Goethe used to pass the greater part of the summer. Finally, in the cemetery is the grand ducal family vault, in which Goethe and Schiller also lie, side by side.

Wieland, who came to Weimar in 1772 as the duke's tutor, is also commemorated by a statue (1857), and his house is indicated by a small monument. The town has been embellished by several other public buildings, including those of Charles Augustus (1785); Lucas Cranach (1886); Marie Seibach (1886); the composer Hummel (1885) and Franz Liszt (1904). Among the other prominent buildings in Weimar are the Grüner Schloss (18th century), containing a library of 200,000 volumes and a valuable collection of portraits, busts and literary and other curiosities; the old ducal dower-house (Wittumspalais); the library, in the palace, containing a small collection of the poet's works; the Teater, which, during the poet's day, was the seat of the Schiller's Verein, and which now contains a museum, and the poet's house, (Schiller'shaus), containing portraits, manuscripts, books, etc. The palace has been the seat of the Grand-ducal government, and the national library has its home there. Among the municipal establishments are a gymnasium, and Realschule, the Sophienstift (a large school for girls of the better class, founded by the grand-duchess Sophia), the grand-ducal school of art, geographical institutes, a technical school, commercial school, music school, teachers' seminaries, and deaf and dumb and blind asylums. An English church was opened in 1869. There are a few industries, printing, tanning and cloth-weaving. Various points in the environs of Weimar are also interesting from their associations. A broad avenue of chestnuts, about 2 m. in length, leads southwards from the town to the grand-ducal chateau 1

1 To be strictly accurate, they thus remained until the death of Goethe's great-granddaughter, whose descendants are still seated in the grand-duke for the nation, was then found to be so structurally rotten that the interior had to be largely reconstructed. Everything was, however, replaced in the exact position it had previously occupied.
of Belvedere, in the gardens of which the open-air theatre, used in Goethe’s day, still exists. To the north-east, at about the same distance from the town, are the tiny château and park of Tiefurt, on the banks of the Ilm, the scene of many pastoral court revels in the past. To the north-west is the Eutersberg, with the Eutersburg, a château which was another favourite resort of Charles Augustus and his friends.

The history of Weimar, apart from its association with Charles Augustus and his court, is of little general interest. The town is said to have existed so early as the 6th century. Till 1140 it belonged to the counts of Oranfünde; it then fell to Albert the Bear and the descendants of his second son. In 1247 Otto III. founded, a separate Weimar line of counts. In 1425 it became a fief of the lands of Thuringia, to whom it was ceded in 1385 with the extinction of the line of Otto III. At the partition of Saxony in 1485 Weimar, with Thuringia, fell to the elder, Ernestine, branch of the Saxon house of Wettin, and has been the continuous residence of the senior branch of the dukes of this line since 1572. Under Charles Augustus Weimar became a centre of Liberalism as well as of art. It had previously narrowly escaped absorption by Napoleon, who passed through the town during the pursuit of the Prussians after the battle of Jena in 1806. The grand-duke dissuaded him from abolishing the duchy by the tact and courage of the duchess Louisa.

The traditions of Charles Augustus were well maintained by his grandson, the grand-duke Charles Alexander (1818–1905), whose statue now stands in the Karlstraße. The grand-duke’s connexion with the courts of Russia and Holland—his mother was a Russian grand-duchess and his wife, Sophia Louisa (1824–1897), a princess of the Netherlands—tended to give the Weimar society a cosmopolitan character, and the grand-duke devoted himself largely to encouraging men of intellect, whether Germans or foreigners, who came to visit or to settle in the town. The art school, founded by him in 1838, has had a notable series of eminent artists among its professors, including Preller, Böcklin, Kalkreuth, Max Schmidt, Pauwels, Heumann, Verlat and Thöny. Under the patronage of Charles Alexander, also, Weimar became a famous musical centre, principally owing to the presence of Franz Liszt, who from 1848 to 1886 made Weimar his principal place of residence. Other notable conductors of the Weimar theatre orchestras were Eduard Lassen and Richard Strauss.

WEINHEIM, a town of Germany, in the grand-duchy of Baden, pleasantly situated on the Bergstrasse at the foot of the Owenal, 11 m. N. of Heidelberg by the railway to Frankfort-on-Main. Pop. (1905) 12,560. It is still in part surrounded by the ruins of its ancient walls. The Gothic town hall; the ruins of the castle of Windeck and the modern castle of the counts of Berckheim; the house of the Teutonic Order; and three churches are the principal buildings. The town has various manufactures, notably leather, machinery and soap, and cultivates fruit and wine. The Bergstrasse boards through the town and forms a great tourist centre for excursions in the Owenal range. Weinehim is mentioned in chronicles as early as the 8th century, when it was a fief of the abbey of Lorsch, and it was fortified in the 14th century. In the Thirty Years’ War it was several times taken and plundered, and its fortifications dismantled.

See Hegewald, Der Luftkurort Weinehm an der Bergstrasse (Weinehm, 1895); Ackermann, Führer durch Weinehm und Umgebung (Weinehm, 1865); and Zinkgraf, Bilder aus der Geschichte der Stadt Weinehm (Weinehm, 1904).

WEINSBERG, a small town of Germany, in the kingdom of Württemberg, pleasantly situated on the Sulm, 5 m. E. from Heilbronn by the railway to Crailsheim. Pop. (1905) 2097. It has an ancient Romanesque church, a monument to the reformer Oecolampadius (q.v.), and a school of viticulture, which is the chief occupation of the inhabitants. On the Schlossberg above the town lie the ruins of the castle of Weilertrecht, and at its foot is the house once inhabited by Justinus Kerner (q.v.), with a public garden and a monument to the poet.

The German king Conrad III. defeated the Saxon Welf VI. of Brunswick near Weinsberg in December 1140, and took the town, which later became a free imperial city. In 1331 it joined the league of the Swabian cities, but was taken by the nobles in 1440 and sold to the elector palatine, thus losing its liberties. It was burnt in 1525 as a punishment for the atrocities committed by the revolting peasants. The famous legend of Weilvertrée ("women’s faithfulness"), immortalized in a ballad by Chamisso, is connected with the siege of 1140, although the story is told of other places. It is said that Conrad III. allowed the women to leave the town with their husbands, whereupon they came out with their husbands on their backs.

WEIR, ROBERT WALTER (1803–1880). American portrait and historical painter, was born at New Rochelle, New York, on the 18th of June 1803. He was a pupil of Jarvis, was elected to the National Academy of Design in 1829, and was teacher of drawing at the United States Military Academy at West Point in 1833–1846, and professor of drawing there in 1846–1876. He died in New York City on the 1st of May 1880. Among his best known works are 'The Pirate,' 'The Pilgrims' (in the rotunda of the United States Capitol at Washington, D.C.); 'Landing of Hendrik Hudson'; "Evening of the Crucifixion"; "Columbus before the Council of Salamanca." "Our Lord on the Mount of Olives"; "Virgil and Dante crossing the Styx," and several portraits, now at West Point, and "Peace and War" in the Chapel there.

His son, JOHN FERGUSON WEIR (b. 1841), painter and sculptor, became a Member of the National Academy of Design in 1866, and was made director of the Yale University Art School in 1885. Another son, JULIAN WEIR (b. 1852), studied in his father, and under J. L. Gerome, and became a distinguished portrait, figure and landscape painter. He was one of the founders of the Society of American Artists in 1877, and became a member of the National Academy of Design (1880) and of the Ten American Painters, New York.

WEIR (from O. Eng. wer, a dam; cognate with werian, to defend, guard; cf. Ger. Wehr, defence), a barrier placed across rivers to raise the water-level for catching fish, for mills, or for navigation or for irrigation, the discharge of the river taking place over the crest or through openings made for the purpose. Reservoirs, formed by dams, or weirs, were erected across English rivers in Saxone times for holding up the water and catching fish, and fish-traps, with iron-wire meshes and eel baskets, are still used sometimes at weirs. Weirs are essential for raising the head of water for water-wheels at mills, and for diverting some of the flow of a river into irrigation canals; but they have received their greatest and most varied extension in the canalization of rivers for navigation. There are three distinct classes of weirs, namely, solid weirs, draw-doors weirs, which retain the water above them for navigation during the low stage of the river, and can be lowered or removed so as to leave the channel quite open in flood-time.

Solid Weirs.—The simplest form of weir is a solid, watertight dam of firm earthwork or rubble stone, faced with stone pitching, with cribs filled with rubble, with fascine mattresses weighted with stone or with masonry, and protected from undermining by shearing piling or one or more rows of well foundations. These weirs, if solidly constructed, possess the advantages of simplicity, strength and durability, and are also economical. However, however, they do not raise the water-level above them. This serious defect of solid weirs, where the riparian lands are liable to be injured by inundations, can be slightly mitigated by keeping down the crest of the weir some what below the required level, and then raising the water-level at the low stage of the river by placing a row of planks along the top of the weir.

Waste weirs resemble ordinary solid weirs in providing for the surplus discharge from a reservoir of an impounded river or mountain stream over their crest; but in reality they form part of a masonry
Lifting-gate Weirs.—The discharge of a river at a weir can be regulated as required and considerably increased in flood-time by introducing a series of openings in the centre of a solid weir, with sluice-gates or panels which slide in grooves at the sides of upright frames or masonry piers erected at convenient intervals apart.

The ordinary form of frame weir consists of a series of iron frames placed across a river on the face of which the doors are raised by a winch. Ordinary draw-doors, sliding in grooves of moderate size and raised against a small head of water, can be readily worked in spite of the friction of the sides of the doors against their supports; but with large draw-doors and a considerable head, the friction of the surfaces in contact offers a serious impediment in raising them. This friction has been greatly reduced by making the draw-doors, or sluice-gates, slide on each side against a vertical row of free-rollers suspended by an encircling chain; and the working is much facilitated by countering the doors. By these arrangements the large draw-door weir across the Thames at Richmond, with three spans of 66 ft. closed by lifting doors, each 12 ft. high and weighing 32 tons, can be fully opened in seven minutes by two men raising each door from the arched double foot-bridge (figs. 1, 2 and 3). This weir retains the river above it at half-tide level, in order to cover the mud-banks which had been bare at low tide between Richmond and Teddington by lowering of the low-water level, owing to the removal of various obstructions in the river below. The weir is raised out of the river as soon as the flood-tide on its lower side has risen to half-tide level, so as not to impede the flow and ebb of the tide up to Teddington above that level, and is not lowered till the tide has risen again to the same level. In order that the doors when raised may not impede the view under the arches, the doors are rotated automatically at the top by groves at the top of the piers, so as to assume a horizontal position and pass out of sight in the central space between the two foot-ways (fig. 2). The barrage at the head of the Nile delta, and the regulating sluices across the Nile at Assiout and Assa in Upper Egypt, are examples of draw-doors, with their numerous openings closed by sluice-gates sliding on free rollers, which control the discharge of water from the river for irrigation.

Frame Weirs.—The ordinary form of frame weir consists of a series of iron frames placed across a river on the face of which the doors are raised by a winch. Ordinary draw-doors, sliding in grooves of moderate size and raised against a small head of water, can be readily handled by a man, being inclined slightly against a vertical chain placed close together for shutting the weir; but panels of wood or sheet iron closing the space between adjacent frames and sliding in grooves at the sides and rolling-up curtains composed of a series of horizontal wooden laths connected by leather or wooden hinges, have also been employed. The needle weir, so called from the long, slender spars being termed aiguilles in France, had the merit of simplicity in its earliest form; and by means of some ingenious contrivances, comprising a hook, winch, lever and rotating bar, for assisting the weir-keepers in placing and releasing the needles, the system has been applied successfully to the weirs of greater height required on the Meuse, the Main and the Moldau (fig. 4). The needle weir has, however, attained its greatest development in the United States across the Big Sandy river at Louisa, where, instead of needles 3 to 4 ft. square, beams 12 in. square and 18 ft. long have been resorted to, provided with a steel eye at the top and a ring near the centre of gravity to enable them to be worked (fig. 5). The needles are put in place one by one against the raised frames, or trestles, by a derrick on a large lifting them by their ring, whilst a man on the foot-bridge, taking hold of the eye at the top, arranges them in position. The weir is opened by joining the needles together by a chain, passed through the eyes at the top and a line of wire through the central rings, so that when released at the top by the tilting of the escape bar by the derrick, they float down as a raft, and are caught by a man in a boat, or, when the current is strong, they are drawn to the bank by a rope attached to them previously to their release. The trestles of this weir are, as usual, hinged to the apron, so that in flood-time they may be completely lowered into a recess across the apron by means of chains actuated by a winch, leaving the channel perfectly open for the discharge of floods and for the passage of vessels when the lock is submerged. Whereas, however, ordinary frames placed nearer together than their height overlap one another, compelling water before the apron, the trestles of the Louisa weir lie clear of each other quite flat on the apron. The frame weir closed by sliding panels or rolling-up curtains (fig. 4) possesses the advantage of not being reduced or diminished in thickness towards the top in proportion to the reduced water-pressure, whereas the needles, being of uniform cross-section, have to be made stout enough to sustain the maximum bottom pressure at top and bottom as well.

An objection has occasionally been urged against frames lowered on to the bed of a river that they are liable to be covered over by detritus or dirt brought down by floods, and consequently are subject to injury or impediments in being raised. In order to

---

obviated this, the frames have, in a few instances, been suspended from an overhead foot-bridge. The system was first proposed in a view of the canalization of the Rhone, which brings down large quantities of shingle and gravel; but it was first adopted for two weirs on the lower Seine under quite different conditions (fig. 7). The frames hang vertically from the bottom of the overhead bridge, and rest against a sill at the bottom when the weir is in operation, the openings between the frames being closed below the water-level by rolling-up curtains or sliding panels, which are lowered or raised by a travelling winch carried by a small foot-bridge formed by hinged brackets at the back of the frames, and situated a little above the highest flood-level. The weir is opened by removing the sliding panels or rolling up the curtains, and then lifting the hinged frames to a horizontal position under the overhead bridge by means of chains worked by a winch on the bridge. This system, which has been employed for the lowest weir on the Moldau, and for a weir at the upper end of the Danube canal near Vienna to shut out floods and strong ice, as well as on the Seine, possesses the merits of raising all the movable parts of the weir out of water in flood-time, and rendering the working of the weir very safe and easy. On the other hand, it involves the expense of a wide foot-bridge for raising the frames, and wide and high river piers, especially for the navigable passes where the bridge has to be raised high enough to afford the regulation headway for vessels at the highest navigable flood-level (fig. 7), so that its adoption should be restricted to positions where the conditions are quite exceptional.

The earliest form of shutter weir, known as a bear-trap, introduced in the United States in 1818, and subsequently erected across the Marne in France, consists of two wooden gates, each turning on a horizontal axis laid across the apron, inclined towards one another and abutting together at an angle in the centre when the weir is closed; the up-stream one serves as the weir, and the down-stream one forms its support, and both fall flat upon the apron for opening the weir.1 This weir is raised by admitting water under pressure beneath the gates through culverts in connection with the upper pool; and is lowered by unfastening the raised gates and letting the water under them escape into the lower pool. This old form of bear-trap has been used for closing an opening 52 ft. wide to provide for the escape of drift at the Davis Island weir across the Ohio. Improvements, however, in the bear-trap have been introduced in the United States, one of the best novel forms being shown in fig. 8, whereby the pass of a weir 80 ft. in width can be readily closed, opened or partially opened under a maximum head of 16 ft. by means of chains worked by a winch.2

The shutter weir, introduced on the upper Seine about the middle of the 19th century and subsequently adopted for weirs across several rivers in France, Belgium and the United States, consists of a row of wooden or iron shutters turning on a horizontal axis a little above their central plane, and raised against the back of each shutter, which is hinged to the apron of the weir, and supported when raised by an iron prop resting against an iron shoe fastened on the apron (fig. 9). The weir is opened by releasing the iron props from their shoes, either by a sideways pull of a tripping bar with projecting teeth laid on the apron and worked from the bank, or by pulling the props clear of their shoes by chains fastened to the bottom of the shutters; the unsupported trestles and shutters fall flat on the apron on the top of the props, as shown by dotted lines in fig. 9. The weir is raised again by pulling up the shutters to a horizontal position by their bottom chains from a special boat, or from a foot-bridge on movable frames, together with their trestles and the props which are replaced in their shoes. The discharge at the weir whilst it is raised is effected either by partially tipping some of the shutters by chains from a foot-bridge, or by opening butterfly valves resembling small shutters in the upper panels of the shutters. The addition of a foot-bridge greatly facilitates the raising and lowering of these shutter weirs, and also aids the regulation of the discharge; but it renders this form of weir much more costly than the ordinary frame weir, and where large quantities of drift come down with sudden floods, the frames of the bridge are liable to be carried away, and therefore boats must be relied upon for working the weir.

The drum weirs erected across shallow, regulating passes on the river Marne in 1857–1867 comprise a series of upper and under wrought-iron paddles, which can make a quarter of a revolution round a central axis laid along the sill of the weir. The straight, upper paddles form the weir, and can be raised against the stream by making the water from the upper pool press upon the upper faces of the slightly larger lower paddles, crooked for the purpose, causing them to revolve in a quadrant of a cylinder under the sill, known as the drum; and they can be readily lowered by cutting off the flow from the upper pool and putting the drum in communication with the lower pool, which connections can be adjusted by see-saw sluice-gates, so as to put the upper paddles in the intermediate position between vertical and horizontal (fig. 10). The merits of this weir in being easily raised against a strong current and in allowing of the perfect regulation of the discharge, are unfortunately, under ordinary conditions, more than counterbalanced by the necessity of carrying the drum and its foundations to a greater depth below the sill of the weir than the height of the weir above it. Accordingly, for several years its use was restricted to the Marne; but in 1853–1866 drum weirs were

---

1 Rivers and Canals, p. 132 and plate iv, fig. 15.
adopted for closing the timber passes alongside the needle weirs placed across the Main, with a single upper paddle 39 ft. long and 5 ft. 7 in. high in each case; and a still larger drum weir was erected about the same time for closing the navigable pass of a weir across the Spree at Charlottenburg, with an upper paddle 32 ft. long and 4 ft. 7 in. high (fig. 10).

A peculiar and cheaper form of drum weir has been constructed across ten bays each 75 ft. wide on the Osage river near its confluence with the Missouri, where a hollow, wooden, cylindrical sector, stiffened inside by iron framing and revolving on an axis laid along the crest of the solid part of the weir, fits into a drum at the back lined with planking, having a radius of 9 ft. The weir is raised by admitting water from the upper pool into a wedge-shaped space left below the sector when it is lowered in the drum, which by its pressure lifts the sector out of the drum, forming a barrier, 7 ft. high, closing each bay of the weir. Provision has also been made for rendering the sector buoyant by forcing air into it, so that it can be raised when the head of water is insufficient to lift it by the pressure of the water from the upper pool. In spite of its high cost, the drum weir furnishes a valuable hydraulic contrivance for situations where it is very important to be able to close a weir of moderate height against a strong current and to regulate with ease and precision the discharge past a weir.

WEISMANN, AUGUST (1834- ), German biologist, was born at Frankfort-on-Main, on the 17th of January 1834, and studied medicine in Gottingen. After spending three years in Rostock, he visited successively Vienna (1858), Italy (1859) and Paris (1860), and from 1851 to 1862 he acted as private physician to the archduke Stephen of Austria at Schaumburg Palace. In 1863 he went to Giessen to devote himself to biological study under Leuckart, and in 1866 he was appointed extraordinary professor of zoology at Freiburg, becoming ordinary professor a few years later. His earlier work was largely concerned with purely zoological investigations, one of his earliest works dealing with the development of the Dipthera. Microscopical work, however, became impossible to him owing to impaired sight, and he turned his attention to wider problems of biological inquiry. Between 1858 and 1876 he published a series of papers in which he attacked the question of the variability of organisms; these were published in an English translation by R. Meldola in 1882, under the title Studies in the Theories of Descent, Darwin himself contributing a preface in which the importance of the nature and cause of variability in individuals was emphasized. Weismann's name, however, is best known as the author of the germ-plasm theory of heredity, with its accompanying denial of the transmission of acquired characters—a theory which on its publication met with considerable opposition, especially in England, from orthodox Darwinism. A series of essays in which this theory is expressed was collected and published in an English translation (Essays upon Heredity and Kindred Biological Problems, vol. i. 1886, vol. ii. 1892).

Weismann published many other works devoted to the exposition of his biological views, among them being Die Dauer des Lebens; Vererbung; Entwickelungsreihe; Naturgeschichte der Pflanzen als Grundlage einer Theorie der Vererbung; Die Keimplasms; Die Ablammung der Naturzuechtung; Allgemeine Entwicklungstheorie; Die wissenschaftliche Grundlage der Theorie der Vererbung; Das Keimplasma. For an account of his doctrines the reader is referred to the articles on HEREDITY, REGENERATION and REPRODUCTION.

WEISS, BERNHARD (1827- ), German Protestant New Testament scholar, was born at Konigsberg on the 20th of June 1827. After studying theology at Königsberg, Halle and Berlin, he became professor extraordinarius at Königsberg in 1857, and afterwards professor ordinarius at Berlin. In 1880 he was made superior consistorial councillor. An opponent of the Tübingen School, he published a number of important works, which are well known to students in Great Britain and America.

WEISSE, CHRISTIAN HERMANN (1801-1866), German Protestant religious philosopher, was born at Leipzig on the 20th of October 1801. He studied at Leipzig, and at first belonged to the Hegelian school of philosophy. In course of time, however, his ideas approximating to those of Schelling in his later years, he elaborated with J. H. v. Fichte a new speculative theism, and became an opponent of Hegel's pantheistic idealism. In his addresses on the future of the Protestant Church (Reden über die Zukunft der evangelischen Kirche, 1849), he finds the essence of Christianity in Jesus' conceptions of the heavenly Father, the Son of Man and the kingdom of Heaven. In his work on philosophical dogmatism (Philosophische Dogmatik oder Philosophie des Religionswissens, 1832), he seeks to idealize all the Christian dogmas, to reduce them to natural postulates of reason or conscience. He died on the 19th of September 1866.

His other works include: Die Idee der Gottheit (1833), Die philosophische Geheimlehre von der Unsterblichkeit des menschlichen Dichters (1834), Theorie von der Auferstehung (1835), Die evangelische Geschichte, kritisch und philosophisch bearbeitet (2 vols., 1838), and Psychologie und Unsterblichkeitslehre (edited by R. Seydler, 1866). See O. Pfleiderer, Development of Theology (1890); and H. Seydler, Christian Herm. Weisse (1886), and Religion and Wissenschaft (1887).

WEISSENBURG, a town in Germany, in the imperial province of Alsace-Lorraine, district of Lower Alsace, on the Lauter, at the foot of the eastern slope of the Vosges Mountains, 42 m. N.E. of Strassburg by the railway Basel-Strassburg-Mannheim. Pop. (1900) 6946. The beautiful Roman Catholic abbey church of SS. Peter and Paul, dating from the 13th century, contains some fine early stained glass. The industries include the manufacture of paper, matches, stockings and beer, and hops are grown. There are also extensively cultivated. Weissemburg grew up round a Benedictine abbey which was founded in the 7th century by Dagobert II. and became the seat of a famous school. Here Otfrid, who was a native of the district, completed (c. 868) his Old High German Gospel book (see GERMAN LITERATURE). The town became a free imperial city in 1205. It has been the scene of two memorable battles. The famous "Weissemburg lines," consisting of entrenched works erected by Villars in 1706 along the Lauter, and having a length of 12 m., were stormed in 1792 by the French under General Marmont. In 1870 the Allies were in their turn dispossessed by Pichegru in December and forced to retreat behind the Rhine. These lines, as well as the fortifications of Weissemburg, are now dismantled. On the 4th of August 1870 the Germans under the crown prince of Prussia, afterwards the emperor Frederick, gained the first victory of the war over a French corps (part of the army commanded by MacMahon) under General Douay, who was killed early in the engagement.
The name Weissenburg occurs in three other places: the town of Weissenburg-am-Sand in Bavaria (q.v.); a Swiss invalid resort in the Niedersimmental, above Lake Thun, with sulphate of lime springs, beneficial for bronchial affections; also a Hungarian comitats named Weissenburg or Suhlweissenburg as a capital.

**WEISSENSFELS,** a town of Germany, in the Bavarian district of Middle Franconia, situated in a pleasant and fertile country at the western foot of the Franconian Jura, 1300 ft. above the sea, and 33 m. by rail S.W. of Nuremberg by the railway to Munich. Pop. (1905) 6700. It is still surrounded by old walls and towers, and has two Gothic churches and a Gothic town-hall. The town has a mineral spring, connected with a hot spring at a distance of 500 m. of an elevation. A Roman castrum has recently been discovered, and there is a collection of antiquities in the modern school. The old fortalice of Wülzburg (2060 ft.) overlooks the town. Gold and silver flure, bricks, cement wares, beer and cloth are manufactured. Weissenburg dates from the 8th century, and in the 14th was made a free imperial town. It passed to Bavaria in 1806.

See C. Meyer, *Chronik der Stadt Weissenburg in Bayern* (Munich, 1904); and Fabricius, *Das Kastell Weissenburg* (Heidelberg, 1860).

**WEIZSÄCKER,** a town of Germany, in the Prussian province of Saxony, situated on the Saale 20 m. S.W. of Leipzig and 19 m. S. of Halle by the main line to Bebra and Frankfort-on-Main. Pop. (1905) 30,894. It contains three churches, a spacious market-place and various educational and benevolent institutions. The former palace, called the Augustusburg, built in 1654-1660, lies on an eminence near the town; this spacious edifice is now used as a military school. Weizensfels manufactures machinery, ironware, paper and other goods, and has an electrical power-house. In the neighbourhood are large deposits of sandstone and lignite. Weizensfels is a place of considerable antiquity, and from 1656 till 1746 it was the capital of the small duchy of Saxe-Weizensfels, a branch of the electoral house of Saxony, founded by Augustus, second son of the elector John George I. The body of Gustavus Adolphus was embalmed at Weizensfels after the battle of Lützen.

See Sturm, *Chronik der Stadt Weizensfels* (Weizensfels, 1846); and Gerhardt, *Geschichte der Stadt Weizensfels* (Weizensfels, 1870).

**WEIZSÄCKER, KARL** (1852-1899), German Protestant theologian, was born at Oehringen near Heilbronn in Württemberg, on the 11th of December 1822. After studying at Tübingen and Berlin, he became Privatdozent at Tübingen in 1847 and eventually (1861) professor of ecclesiastical and dogmatic history. From 1856 to 1878 he helped to edit the *Jahrbücher für deutsche Theologie*; and his elaborate studies Untersuchungen über die evangelische Geschichte, ihre Quellen und den Gang ihrer Entwicklung (1864) and *Das apostolische Zeitalter der christ. Kirche* (1856, 2nd ed. 1859; Engl. trans. 1864-1865) made him widely known and respected. He died on the 11th of August 1899. His son, Karl von Weizsäcker (b. 1853), was appointed in 1900 Kultusminister for Württemberg.

**WEKERLE, SANTOR** [ALEXANDER] (1848-1902), Hungarian statesman, was born on the 14th of November 1848 at Mősz, in the comitat of Stuhlweissenburg. After studying law at the university of Budapest he graduated doctor juris. He then entered the government service, and after a period of probation was appointed to a post in the ministry of finance. He still, however, continued an academic career by lecturing on political economy at the university. In 1886 Wekerle was elected to the House of Deputies, became in the same year financial secretary of state, and in 1889 succeeded Tisa as minister of finance. Subsequently he dedicated himself to improving the financial position of the country, carried out the conversion of the State loans, and succeeded, for the first time in the history of the Hungarian budget, in avoiding a deficit. In November 1892 Wekerle succeeded Count Szápary as premier, though still retaining the portfolio of finance. At the head of a strong government he was enabled, in spite of a powerful opposition of Catholics and Magnates, to carry in 1894 the Civil Marriage Bill. The continued opposition of the clerical party, however, brought about his resignation on the 22nd of December 1894, when he was succeeded by Banffy. On the 1st of January 1897 he was appointed president of the newly created judicial commission at Budapest, and for the next few years held aloof from politics, even under the ex-lex government of Fejérváry. On the reconciliation of the king-emperor with the coalition he was therefore selected as the most suitable man to lead the new government, and on the 8th of April 1906 was appointed prime minister, taking at the same time the portfolio of finance. He resigned the premiership on the 17th of April 1906, but was appointed minister without portfolio. Consequently he relieved his ex-ministers and reappointed his old premiership and teaching and university lectures was in the following year appointed the first professor of Greek literature and archaeology at that or any German university. After serving as a volunteer in the campaign of 1814 he went to Copenhagen to edit the posthumous papers of the Danish archaeologist Georg Zeöga (1755-1809), and published his biography, *Zeöga Leben* (Stutt. 1819). His liberalism in politics having brought him into conflict with the university authorities of Giessen, he exchanged that university for Göttingen in 1816, and three years later received a chair at the new university of Bonn, where he established the art museum and the Library, of which he became the first librarian. In 1841-1843 he travelled in Greece and Italy (cf. his *Tagbuch*, Berlin, 1865), retired from the librarianship in 1854, and in 1861 from his professorship, but continued to reside at Bonn until his death. Welcker was a pioneer in the field of archaeology, and was one of the first to insist, in opposition to the narrow methods of the older Hellenists, on the necessity of co-ordinating the Greek art and religion with philosophy.

Besides early work on Aristophanes, Findar, and Sappho, whose character he vindicated, he edited Alman (1815), *Welcker* (1817), *Theologie* (1840), and *Theogonie of Homer* (1865), and published a *Sylloge epigrammatum Graecorum* (Bonn, 1828). His *Griechische Götterleere* (3 vols., Göttingen, 1837-1842) may be regarded as the first scientific treatise on Greek religion. Among his works on Greek literature the chief are Die Aschy- leische Triologie (1824, 6), Der epische Zyklus oder die Homerischen Gedichte (*vols. 1835, 49), Die griechischen Tragödien mit Rücksicht auf den epischen Zyklus geordnet (*vols. 1839-1841). His editions and biography of Zeöga, his Zeitschrift für Geschichte und Auskunft der alten Kunst (Göttingen, 1817, 8) and his *Alte Denkmüller* (5 vols., 1849-1864) contain his views on ancient art.

**WELDING** (i.e. the action of the verb "to weld," the same word as "to weld," to boil or spring up, the history of the word being to boil, to heat to a high degree, to heat heated iron; according to Skeat, who points out that in Swedish the compound verb *uppvarra* means to boil, the simple *vär* is only used in the sense of welding), the process of uniting metallic surfaces by pressure exercised when they are in a semi-fused state. It differs therefore from brazing and soldering. The surfaces to which in cold welds are united by the interposition of a fused cementing material. The conditions in which welding is a suitable process to adopt are stated in the article *FORGING*.

The technique of the work will be considered here.

The conditions for successful welding may be summed up as clean metallic surfaces in contact, a suitable temperature and rapid closing of the joint. All the variations in the forms of welds are either due to differences in shapes of material, or to
The practice of different craftsmen. The typical weld is the scarf. If, for instance, a bar has to be united to another bar or to an eye, the joint is made diagonally (scarfed) because that gives a longer surface in contact than a weld at right angles (a butt weld), and because the hammer can be brought into play better. Abutting faces for a scarf and the scarf are made slightly convex; the object is to force out any scale or dirt which might otherwise become entangled in the joint at the moment of closing and which would impair its union. The ends are upset (enlarged) previous to welding, in order to give an excess of metal that will permit of slight corrections being effected around the joint ("swaging") without reducing the diameter below that of the remainder of the bar. These principles are seen in other joints of diverse types, in the butt, the vee and their modifications. Joint faces must be clean, both chemically, i.e. free from oxides, and mechanically, i.e. free from dust and dirt, else they will not unite. The first condition is fulfilled by the use of a fluxing agent, the second by ordinary precautions. The flux produces with the oxide a fluid slag which is squeezed out at the instant of making the weld. The commonest fluxes are sand, used chiefly with wrought iron, and borax, used with steel; they are dusted over the joint faces both while in the fire and on the anvil. Mechanical cleanliness is ensured by heating the ends in a clean hollow fire previously prepared, and in brushing off any adherent particles of fuel before closing the weld. The scarf, the butt and the vee occur in various modifications of all kinds of forgings, but the principal precautions to be observed are the same in all. But in work involving the use of rolled sections, as angles, tees, channels and joists, important differences occur, because the awkwardness of the shapes to be welded involves cutting and bending and the insertion of separate welding pieces ("guts"). Welds are seldom made lengthwise in rolled sections, nor at right angles, because union is effected in such cases by means of riveted joints. But welding is essential in all bending of sections done at sharp angles or to curves of small radius. It is necessary, because a broken flange cannot be bent sharply; if the attempt be made when it is on an outer curve it is either ruptured or much attenuated, while on an inner curve it is crumpled up. The plater's smith therefore cuts the flanges in both cases, and then bends and welds them. If it is on an inner curve, the joint is a lap weld; if it is on an outer one, a fresh piece or gut is welded in. Gluts of rectangular section are used for cylindrical objects and rings of various sections. The edges to be united may or may not be scarfed, and the gluts, which are plain bars, are welded against the edges, all being brought to a wicking heat in separate furnaces. The furnace tubes of brass and the copper and iron pipes are welded in this way, sometimes by hand, but often with a power hammer, as also are all rings of angle and other sections on the vertical web.

The temperature for welding is very important. It must be high enough to render the surfaces in contact pasty, but must not be in excess, else the metal will become badly oxidized (burnt) and will not adhere. Iron can be raised to a temperature at which minute globules melt and fall off, but steel must not be heated nearly so much, and a moderate white heat must not be exceeded. Welds in steel are not so trustworthy nor so readily made as in iron.

Thermite Welding.—The alfinity of finely powdered aluminium for metallic oxides, sulphides, chlorides, &c., may be utilized to effect a reduction of metals with which oxygen, sulphur or chlorine combine. C. Vautin in 1894 found that when aluminium in a finely divided state was mixed with such compounds and ignited, an exceedingly high temperature, about 3000° C., was developed by the rapid oxidation of the aluminium. He found that metals which are ordinarily regarded as insusible were readily reduced, and in a very high degree of purity. These facts were turned to practical account by Dr H. Goldschmidt, who first welded iron and bars by means of molten iron produced by the process, to which the name of "thermit" is now commonly applied. The method has also been applied to the production of pure metals for alloying purposes, as of chromium free from carbon, used in the manufacture of chrome steel, of pure manganese for manganese steel, of molybdenum, ferro-vanadium, ferro-titanium and others used in the manufacture of high speed steels.

Thermite as a welding agent is produced by mixing iron oxides with finely granulated aluminium, in a special crucible lined with magnesia. On ignition, the chemical reactions proceed so rapidly that the contents would be reduced to liquid before the crucible could cool. The result of the reaction is that two layers are produced, the bottom one of pure iron, the top one of oxide of alumina or corundum. If the contents are poured over the edge, the bottom layer, first, is followed by the metal. But in welding the metal is poured first through the bottom upon the joint. It is practically pure wrought iron in a molten state, at 3000° C., or 5430° F. The heat is so intense that it is possible to open a clean joint in a flash. The joints are prepared by abutting them, and provision is made with clamps to grip and retain them in correct positions. Often, but not always, the part to be welded is enclosed in a mould, into which the thermite is tapped from the crucible. The applications of thermite welding are numerous. A wide field is that of tramway rails, of which large numbers have been successfully welded. Steel girder has been welded, the plate also have broken and faulty steel and iron castings, broken shafts, broken stop-nuts (for which crutchles 6 ft. in height with a capacity of 7 cwt. have been constructed), and wrought iron pipes. Another application is the repair of ship bottoms by the addition of a bar of iron rod to the mould, which prevents or greatly lessens the amount of piping in the head, due to shrinkage and occlusion of gases.

Electric Welding.—In electric welding and metal working the heat may be communicated to the metal by an electric arc, or by means of the electric resistance of the metal, as in the Thomson process. Arc welding and it appears to have been first made use of by de Meritens in 1881 for uniting the parts of storage-battery plates. The work-piece was placed upon a support or table, and connected with the positive pole of a source of current capable of maintaining an electric arc. The other pole was a carbon rod directed by the hand of the operator so as first to make contact with the work-piece, and then to effect the proper separation to maintain the arc. The heat of the arc was partly communicated to the work and partly dissipated in the hot gases escaping into the surrounding air. The result was a fusion of the metal lead of the storage-battery plate which united various parts of the plate. The process was somewhat similar to the operation of lead-burning by the hydrogen and air blowpipe, as used in the formation of joints in chemical tanks made of sheet-lead. The method of de Meritens has been modified by Bernardos and Olszewski, Slavienoff, Cofin and others.

In the Bernardos and Olszewski process the work is made the negative pole of a direct current circuit, and an arc is drawn between this and a carbon rod, to which a handle is attached for manipulating. As this rod is the positive pole, the negative sides of the battery may be inlayed with a conductor of the metal taking part in the operation, making it hard and brittle, and causing cracks in the joint or filling; the metal may, in fact, become very hard and unworkable. The Slavienoff modification of the arc-welding process consists in the employment of a metal electrode in place of the carbon rod. The metal electrode gradually melts, and furnishes fused drops of metal for the filling of vacant spaces in castings, or for forming a joint between two parts or pieces.

In arc welding, with a current source at practically constant current, a varying resistance in series with the heating arc is needed to secure stability in the arc current, as in electric arc lighting from constant potential lines. Little effective work can be done by the Bernardos and Olszewski method, in which the current is constant in the arc, and the value in some cases ranges above 500 amperes. The potential must be such that an arc of 2 to 3 in. in length is steadily maintained. This may demand a total of about 120 volts, the arc length varying with the current. In arc welding, the arc being made the positive pole of the current, the negative terminal of the metal taking part in the operation, making it hard and brittle, and causing cracks in the joint or filling; the metal may, in fact, become very hard and unworkable. The Slavienoff modification of the arc-welding process consists in the employment of a metal electrode in place of the carbon rod. The metal electrode gradually melts, and furnishes fused drops of metal for the filling of vacant spaces in castings, or for forming a joint between two parts or pieces.
The arc method is essentially a fusing process, though with due care to the holding of plastics to minute, small pieces should be welded by pressure and hammering. It has been found applicable in special cases to the filling of defective spots in iron castings, by fusing into bar holes, etc., or in the fusion of castings of iron, where the mass must be made so as to receive the addition gradually, and melted into union with the body of the piece by the heat of the arc. Similarly, and about a still more complete union between separate pieces of iron plate 1⁄2 in. or 1 in. in thickness has been effectual. In many cases of repair work the operator does not care to arrange the arc for operations to which the arc process is applicable in a natural, what limited, and depends to a large extent upon the skill acquired by the operator, who necessarily works with his eyes well screened from the light of the arc. The spot to be heated is the chief thing. The heat is communicated by the capsules of the arc, and, to a small extent, by the radiation from the hot carbon electrodes between which the arc is formed. The process is scarcely to be called electric in any true sense. Another curious operation, resembling in some respects the arc methods, has been proposed for the heating of metal pieces before they are brought under the hammer for forging or welding. The end of a metal bar is plunged into an electrolytic bath which is connected with the negative pole of an arc lit, or other electric circuit having a potential of 100 to 150 volts. The positive pole is connected with a metal plate as an anode immersed in the electrolyte, or, more simply, the container for the bath is made of sulphuric acid and sodium or potassium carbonate is a suitable electrolyte. That part of the bar which is immersed acts as a cathode of limited surface, and is at once seen to be surrounded by a luminous glow, with gas bubbling arising from it. The immersed end of the bar rapidly heats, and may even melt under the liquid of the bath. It is probable that the arc forms between the surface of the metal and the adjacent liquid, the interposed heat of which is in part communicated directly to the metal and in part lost in the bath. The whole action of the arc heating of the bath. This singular action appears to have been first made known by Holbe and Lagrange. It is distinctly a form of electric heating, and has no necessity of being associated with an alternating current, as welding, and is, moreover, wasteful of energy, as the heat is largely carried off in the liquid bath.

The process of Elihu Thomson first brought to public notice in 1886, has since that time been applied commercially on a large scale to various metal-welding operations. The metal pieces to be united are held in massive clamps and pressed together in firm contact; and a current is made to traverse the proposed joint, bringing it to the welding temperature. The union is effected by forcing the pieces together mechanically. The characteristic feature of the process is the fact that the heat is given out in the body of the metal.

The voltage does not usually exceed two or three, though it may reach four or five volts; but as the resistance of the metal pieces to be joined is low, the currents are much of very high intensity, sometimes reaching between 5,000 and 100,000 amperes. Even for the joining of small wires the current is rarely less than 100 amperes. Such currents cannot, of course, be carried more than a few feet without loss, even more directly, unless they are given to some definite section. With alternating currents, also, the effectiveness of the work speedily diminishes, on account of the inductive drop in the leads, if they are of any considerable length. The carrying of the welding current in a long lead is impracticable; the feet may be heated, and subjected to serious losses. These difficulties are overcome in the Thomson welding transformer, which resembles the step-down transformers used in alternating current practice, with the exception that the secondary coil or conductor, which forms part of the welding circuit, usually consists of only one turn of great section, S S (fig. 1). This is often made in the form of a copper casing, which surrounds or encloses the primary coil P P in whole or in part. The primary coil is of copper wire of many turns. The secondary casing, with the primary enclosed, is provided with the usual laminated iron-transformer core, I, constituting a closed iron-magnetic circuit of both primary and secondary circuits. The terminals of the single-turn secondary serve as connections and supports for the welding clamps C D, which hold the work properly in position to receive the fusing mass of metal. To adapt them, but usually 300 volts is employed, and the periodicity is about 60 cycles. Inasmuch as only the proposed joint and a small amount of metal on each side of it are concerned in the operation, the delivery of energy is closed localized. The chief electrical resistance in the welding circuit is in the projections between the clamps, where the electric energy is delivered and appears as heat. A portion of the energy is, as usual, lost in the transformation and in the resistance of the circuits elsewhere, but, by proper proportioning, the loss may be kept down to a moderate percentage of the total, as in other electric work.

The pieces are set firmly in the welding clamps, with the ends to be joined in abutment and in electric contact. The projection of each piece from the clamp varies with the section of the pieces, their form and the nature of the metal, and the time in which a joint is to be made; but it rarely exceeds the thickness or diameter of the pieces, except with metals of high heat conductivity such as copper. When the pieces are in place the current is turned into the primary coil of the transformer, sometimes in one, and in full force, but more often gradually. Switches and regulating devices in the primary circuit permit complete and delicate control. At least one of the clamps, D (fig. 1), is movable through a limited range towards and from the other, and thus the means of exerting pressure for forcing the softened metal into complete union. In large work the motion is given by a hydraulic cylinder and piston, under suitable control by valves. At about the time the current is cut off, it is usual to apply increased pressure. The softened metal is upset or pressed outwards at the joint and forms a characteristic burr, which may be removed by filing or grinding, or be hammered down while the metal is still hot. Sometimes the burr is objectionable, and is allowed to remain. Lap welds may be made, but butt welds are found to be satisfactory for most purposes. The appearance of round bars in abutment before welding is shown in fig. 2 at A; and at B they are represented as having been joined by an electric butt weld, with the slight upset or burr at the joint. Before the introduction of the Thomson process a few only of the metals, such as platinum, gold and iron, were regarded as weldable; now nearly all metals and alloys may be readily joined. Such combinations as tin and zinc, lead and copper, brass and bismuth, brass and iron, nickel, brass and German silver, silver and copper, copper and platinum, iron and German silver, tin and zinc, zinc and cadmium, &c., are easily made; even brittle crystalline metals like bismuth and antimony may be welded, as well as different metals and alloys whose fusing or softening temperatures do not differ too widely.

If the meeting ends conduct sufficiently to start the heating, it is not necessary that they should fit closely together, nor is it necessary that they should be quite clean, the effect of the incipient heating being to confer conductivity upon the scale and oxide at the joint.
WELDING

In some cases the application of a flux, such as borax, enables the welding to be accomplished at a lower temperature, thus avoiding risk of injury by excessive heating. While the pieces are heating, the increase of temperature may raise the specific resistance of the metal so that the current required will be lessened per unit of area, while on the other hand the growing perfection of contact during welding, by increasing the conducting area at the joint, compensates for this in that it tends to the increase of current. With some alloys like brass and German silver, which have a low temperature coefficient, this compensating effect is nearly absent. The increase of specific resistance of the metals with increase of temperature has another valuable effect in properly distributing the heating over the whole section of the joint. A portion which may be for the moment at a lower temperature than other portions will necessarily have a lower relative resistance, and more current will be diverted to it. This action rapidly brings any cooler portion into equipoise with the rest. It also prevents the overheating of the interior portions which are not losing heat by radiation and convection. The success of the electric process in welding metals which were not formerly regarded as weldable is probably due to a measure to this cause, and also to the ease of control of the operation, for the operator may work within far narrower limits of plasticity and fusibility than with the forge fire or blowpipe. The mechanical pressure may be automatically applied and the current automatically cut off after the completion of the weld. In some more recent types of welders the clamping and releasing of the pieces are also accomplished automatically, and nothing is left for the operator to do but to feed the pieces into the clamps. Repetition-work is thus rapidly and accurately done. The automatic welder represented in fig. 3 has a capacity of nearly 1000 welds per day. The capacity required is subject to considerable variation: the more rigid the material at the welding temperature, the greater is the necessary pressure. With copper the force may be about 600 pounds per square inch of section; with wrought iron, 1200 pounds; and with steel, 1800 pounds. It is customary to begin the operation with a much lighter pressure than that used when all parts of the pieces at the joint have come into contact. The pressure exerted in completing the weld has the effect of extruding from the joint all dust and slag, together with most of the metal which is rendered plastic by the heat. The strongest electric welds are those effected by this extrusion from the joint, in consequence of heavy pressure quickly applied at the time of completion of the weld. The unhammered weld, as ordinarily made by the electric process, has substantially the same strength as the annealed metal of the bar, the break under tensile strain, when the butt at the weld is left on, usually occurring a little to one side of the joint proper, where the metal has been annealed by heating. Hammering or forging the joint while the metal cools, in the case of malleable metals such as iron or copper, will usually greatly toughen the metal, and it should be resorted to where a more finished weld is desired. The strength of the subject is partially effected by placing the weld, while still hot, between dies pressed forcibly together so as to give to the weld some desired form, as in drop-forging.

The amount of electric energy necessary for welding by the Thomson process varies with the different metals, their electric conductivity, their heat conductivity, fusibility, the shape of the pieces, section at the joint, &c. In the following table are given some results obtained in the working of iron, brass and copper. The figures are of course only approximate, and refer to one condition alone of time-consumption in the making of each weld, and the more rapidly the work is done, the less, as a rule, is the total energy required; but the rate of output of the plant must be increased with increase of speed, and this involves a larger plant, the consequent expense of which is often disadvantageous. If in the following table the watts for a given section be multiplied by the time, the relation between the total energy required for different sections of the same metal, or for the same section of different metals, is obtained. These products are given under the head of watt-seconds. It will be seen that the energy increases more rapidly than the sections of the pieces—doubtless because the larger pieces take a longer time to weld, with the result that the increase of heat along the bars back from the joint. If the time of welding could be made the same for various sections, it is probable that the energy required would be nearly in direct proportion to the area of section of any given metal. This relation would however, only hold approximately, as there is a greater relative loss of heat by radiation and convection into the air from the pieces of larger sections. The time of welding in watt-seconds for different sections of copper will be found to be about half as much again as that for the same section of iron, while the amounts of energy required for equal sections of brass and iron do not greatly differ.

ENERGY USED IN ELECTRIC WELDING

In practice, joints in solid bars or in wires are the most common, but the process is applicable to pieces of quite varied form. Joints in iron, brass, or lead pipe are readily made; strips of sheet metal are joined, as in band saws; bars or tubes are joined at various angles; sheet metal is joined to bars, &c. One of the more interesting of the recent applications of electric welding is the longitudinal seating of thin steel pipe. The metal is sketched in long strips, bent to form a hollow cylinder or pipe, and the longitudinal seam moves through a special welder, which passes a current across it. The work is completed by drawing the pipe through dies. The welding of a ring formed by bending a short bar into a circle affords an excellent illustration of the character of the currents employed in the Thomson process. Notwithstanding the comparatively free path around the ring through the full section of the bent bar, the current heats the annulated ends to the welding temperature. In this way large and narrow wheels, harness rings, pail and barrel hoops, and similar objects are extensively produced. The process is also largely applied to the welding of iron and copper wires used for electric lines and conductors, of steel axles, tires and metal frames used in canvas work, and of such parts of metallic pipes as the head, orclamps, crack hangers, seat posts, forks, and steel tubing for the frames. The heat, whether it be utilized in welding or brazing, is so readily localized that no metal is done the finishing of a short distance from the weld or joint. Parts can be accurately formed and finished before being joined, as in the welding of taper shanks to drills, the lengthening of drills, screw taps, or augers, and the like. Electric welding is applied to joints of pieces or to conditions of work which would be impracticable with the ordinary forge fire or gas blowpipe. A characteristic instance is the wire bands which hold in place the solid rubbers of vehicles. The process of the rubber forbids the application of the heat of a fire or blowpipe, but by springing the rubber back from the proposed joint and searing the ends of wire by the electric welding clamps, the union is rapidly and easily made. When the rubber of the tyre is released, it covers...
the joint, regaining its complete form. Special manufactures have in some cases arisen based upon the use of electric welding.

The welding of rails and the manufacture of various other electrically welded devices connected with them, vary widely in accordance with the work they have to do. A machine for forming metal rails is so constructed that the hubs are made in a group, and when brought together over rollers, are pressed to the radiating iron spoked wheels of the spokes. The two sections are then welded, and held in solid union with themselves. Another machine, designed for the manufacture of wire fences, are electrically welded simultaneously and rapidly. Galvanized iron wires are fed into the machine from reels in several parallel lines about a foot apart, and at intervals are crossed at right angles by wire sections cut automatically from another reel of wire. The humps are placed in the teeth of the transverse and the parallel lines. The machine delivers a continuous web of iron fencing, which is wound upon a drum and removed from the roller, and laid in rolls. In another type, some State railways are welded into continuous metal track. A huge welding transformer is suspended upon a crane, which is borne upon a car arranged to run upon the track as it is laid. The joint between the ends of two contiguous rails is made by welding lateral strip pieces, covering the joint at each side and taking the place of the ordinary fish-plates and bolts. The exertion of a greatly increased pressure at the finish of the welding seems to be only feasible for the terminal and strength of the joints. When properly made, the joint is strong enough to resist the strains of extension and compression during temperature changes. For electric railways the work may be done in a more necessarily rapid "welding" manner, using copper wires to convert them into continuous lines of return conductors for the railway current. In railway welding the source of energy is usually a current delivered from the trolley line itself to an apparatus located on the track, a current is induced to the circuit at a sufficient rate and amperage, such that the required current is obtained for feeding the primary circuit of the welding transformer. Power from a distant station is thus made to perform the necessary feats, even for tracks which are laid at a distance from the place where it is to be utilized. In this instance the work is stationary while the welding apparatus is moved from one joint to the next. Welding transformers are sometimes used to heat metal for annealing, for forging, bending, or shaping, for tempering, or for hardening. Under special conditions they are well adapted to these purposes, on account of the perfect control of the heating or energy delivery, and the rapidity and cleanliness of the operation.

Armour-plate annealing, it was practically impossible to render any portion of the hardened face of such armour workable by cutting tools without detriment to the hardness of the rest. A very heavy electric current is passed through the spot or area which it is desired to soften, so that, notwithstanding the rapid conduction of heat into the body of the metal, it is brought to a somewhat lower heat; in other words the spot shall not reharden, it is requisite that the rate of cooling shall be slower than when the heating current is cut off suddenly, the current therefore undergoes gradual diminution, under control of a suitable welding transformer, which has for its functions to maintain the terminals simply two copper blocks fixed in position, and mounted at a distance of an inch or more apart. These are placed firmly against the face of the armour plate, with the spot to be annealed bridging the contacts, or situated between them. As in track welding, the transformer is made movable, so that it can be brought into any position desired. When the annealing is to be done along a line, the secondary terminals, with the transformer, are slowly and steadily slid over the face of the plate, new portions of the plate being thus continually brought between the terminals, while those which had reached the proper heat are slowly removed from the terminals (E. T. 1).

WELDON, WALTER (1832-1885), English technical chemist, was born at Loughborough on the 31st of October 1832. In 1854 he began to work as a journalist in London in connexion with the Dial, which was afterwards incorporated in the Morning Star, and in 1860 he started a monthly magazine, Weldon’s Register of Facts and Occurrences relating to Literature, the Sciences and the Arts, which was discontinued after about three years’ existence. Though he was without practical knowledge of the science, Weldon turned to industrial chemistry, and in the course of a few years took out the patents which led to his “manganese-regeneration” process (see CHLORINE). This was put into operation about 1865, and by 1872 it was being used by almost every chlorine manufacturer of importance throughout Europe. He continued to work at the production of chlorine in connexion with the processes of alkali-manufacture (q.v.), and became a leading authority on the subject, but none of his later proposals—not even the Weldon-Pechiney magnesia process, which was established on a commercial scale only a year or two before his death—met with equal success. He died at Burston, Surrey, on the 20th of September 1885. He professed Swedenborgian principles and was a believer in spiritualism.

His son, WALTER FRANK RAPHAEL WELDON (1860-1906), was appointed in 1899 Linacre professor of comparative anatomy at Oxford.

WELF or GUELPH, a princely family of Germany, descended from Count Warin of Altorf (8th century), whose son Isenbrand is said to have named his family Welfen, i.e. whelps. From his son Welf I. (d. 824) were descended the kings of Upper Burgundy and the elder German line of Welf. Welf III. (d. 859) obtained the duchy of Carinthia and the March of Verona. With him the elder line became extinct, but his grandson in the female line, Welf IV. (as duke, Welf I.), founded the younger line, and was also ancestor of the line of Saxony. Welf IV. (d. 1169) by his marriage with a daughter of Magnus, duke of Saxony, obtained half of the latter’s hereditary possessions, including Lüneburg, and his son Henry the Proud (q.v.) inherited by marriage the emperor Lothair’s lands in Brunswick, &c., and received the duchy of Saxony. The power which the family thus acquired, and the consequent rivalry with the house of Hohenstaufen, occasioned the strife of Guelphs and Ghibelhines (q.v.) in Italy. Henry the Lion lost the duchies of Bavaria and Saxony by his rebellion in 1186, and Welf VI. (d. 1191) left his hereditary possessions in Upper Bavaria and his hereditary position to his son Henry VI. Thus, although one of the Welfs reigned as the emperor Otto IV., there remained to the family nothing but the lands inherited from the emperor Lothair, which were made into the duchy of Brunswick in 1235. Of the many branches of the house of Brunswick that of Wolfenbüttel became extinct in 1884, and that of Lüneburg received the electoral dignity of Hanover in 1692, and founded the Hanoverian dynasty of Great Britain and Ireland in 1714. For its further history see HANOVER.

The Hanoverian legitimists in the German Reichstag are known as Welfen.

WELHAVEN, JOHANN SEBASTIAN CAMMERMEYER (1807-1873), Norwegian poet and critic, was born at Bergen, the son of a pastor, in 1807. He first studied theology, but from 1828 onwards devoted himself to literature. In 1840 he became reader and subsequently professor of philosophy at Christiania, and delivered a series of impressive lectures on literary subjects. In 1836 he visited France and Germany; and in 1858 he went to Italy to study archaeology. His influence was extended by his appointment as director of the Society of Arts. He died at Christiania on the 21st of October 1873. Welhaven made his name as the representative of conservatism in Norwegian literature. In a long essay on Wergeland he opposed the theories of the extreme nationalists. He desired to see Norwegian culture brought into line with that of other European countries, and he himself followed the romantic tradition, being most closely influenced by J. L. Heiberg. He represented clearness and moderation against the extravagances of Wergeland. He gave an admirable practical exposition of his aesthetic creed in the sonnet cycle Norges Daerninge (1834). He published a volume of Dige in 1839; and in 1845 Nyere Dige. The collections of old Norse poetry made by Asbjörnsen and Moe influenced his talent, and he first showed his full powers as a poet in Nyere Dige. His descriptive poetry is admirable, but his best work was inspired by his poems on old Norse subjects, in which he gives himself unrestrainedly to patriotic enthusiasm. Other poems followed in 1848, 1851 and 1859.

WELHAVEN’S Samlede Skrifter were published in 1857 and in 1869.

WELL, the name given to an artificial boring in the earth through which water can be obtained. Two classes may be distinguished: shallow or ordinary wells, sunk through a permeable stratum until an impermeable stratum is reached; and deep and Artesian wells (q.v.), the latter named from Artois.
in France, which are sunk through an impermeable stratum down into a water-bearing stratum which overlies an impermeable stratum. Obviously ordinary wells can supply water very cheaply, but, since impurities readily reach them, there is great risk of contamination. The same does not apply to deep wells, such water being usually free from organic impurities. In ordinary wells, and in deep wells, the water requires pumping to the surface; in artesian wells, on the other hand, the water usually spouts up to a great height and adds height to its reputation.

The Tertiary and Secondary geological formations, such as those underneath London and Paris, often present the appearance of immense basins, the boundary or rim of the basin having been formed by an upheaval of the subjacent strata. In these formations it is often possible to find two or more impermeable layers of clay, so as to form a flat porous U tube, continuous from side to side of the valley, the outcrop on the surrounding hills forming the mouth of the tube. The water flowing down through the porous layer to the bottom of the basin forms there a subterranean pool, which with the liquid or semi-liquid column pressing upon it constitutes a sort of huge natural hydrostatic bells. It is obvious then, that if and when a breach is formed down through the upper impermeable layer to the surface of the lake, the water will be forced up by this pressure to a height above the surface of the valley greater or less according to the elevation of the level in the feeding column, thus forming another artesian well.

In the Tertiary formations, the porous layers are not so thick as in the Secondary, and consequently the occurrence of underground lakes is not so great in this formation; but occasionally boring a mere inch or so in the sandy clay beds, we find a greater number of them, and often a series of natural fountains may be obtained in the same valley, proceeding from water-bearing strata at different depths, and rising to the surface at different points.

It does not follow that all the essentials for an artesian well are present, though two strata with a porous stratum between may crop out round a basin. There must also be a continuity of the permeable bed for the uninterrupted passage of the water, and no breach in either of the confining layers by which the water might escape. It has occasionally happened that on deepening the bore, with the hope of finding water, it has come from the ground with great verve from the lower confining layer being pierced, and the water allowed to escape by another outlet. The subterranean pool is frequently of small extent, and of the nature of a channel rather than of a basin; the water in the channel is used up very fast, and artificial means must be resorted to for conserving and certain manufacturing purposes although it is stil for drinking.

The mechanical appliances employed in boring for water are practically the same as in boring for petroleum (q.v.).

The upper part of a deep well may be of brick, the construction being lined with steel pipes, or, better, it may be lined with metal for its entire length.

One of the most remarkable artesian wells is that at Grenelle, near Paris. The operation of boring extended from 1834 to 1841; after a depth of 1254 ft. had been reached (May 1837), a length of 270 ft. of the boring rods broke and fell to the bottom of the hole, and nearly fifteen months' constant labour was required to pick it up again. Discouraged by the delay, the French government was to have abandoned the project after a depth of 1500 ft. had been reached without any satisfactory result; but Arago prevailed on the government to proceed. The work was completed about 300 ft. below the correctness of Arago's theory. On the 26th February 1841, at a depth of 1798 ft., the boring rods suddenly sank a few yards, and with great difficulty, by working both with their primitive and their new machines, they obtained 600 gallons per minute, and at a temperature of nearly 82° F.

Prior to this no artesian boring had reached even 1000 ft.; and that of Grenelle was the deepest executed till the completion (12th August 1840) of one at Passy, in which 600 gallons of water per minute were obtained at a depth of 1072 ft., with a temperature of 168° F. In 1849, a depth of 1830 ft. was reached; the column of water to the height of 58 ft. from a depth of 1838 ft. The most remarkable feature of this spring is that the projecting force is due, not to hydrostatic pressure, but to that of carbonic gas, and that it extends over a bed of limestone, about 1680 ft. down. Modern mechanical improvements have enabled engineers to exceed these Artesian dimensions considerably, and wells have been produced in other parts of France, Paris, which is supplied from the same water-bearing stratum as that of Grenelle, was bored by Kind in a very short time, having been begun on 15th September 1855, and carried to a depth of 1732 ft. by March 1857. Its total depth is now about 1923 ft. with the diameter of 2 ft. 4 in. at the bottom; and it throws up a constant average rate of water of 500 gallons per minute, and a half million gallons per day to a height of 54 ft. above the ground.

Among other deep wells sunk in the Paris basin subsequently to those at Grenelle and Passy, the most remarkable is a deep well at a depth of 2905 ft. which was bored at the end of 1859 to a depth of 3100 ft. and a half years (1864-1867), for the purpose of obtaining a water-supply for the sugar refinery of Say in Paris; and the same engineer who executed this work (Dru) began in 1835 to a depth of 615 ft. the huge diameter of 6 ft. of the well in the district of Paris named Butte aux Cailles, to be carried down to a depth of 2500 to 2900 ft. In the Paris basin there are a great many other wells, varying from 300 to 1000 ft. in depth, and from 2 to 8 in. in the diameter of the bore-hole.

The Tertiary chalk strata over which London stands have been riddled with artesian borings for the sake of pure water supply. Many of the large London factories, railways, institutions are supplied by artesian wells over 300 ft. deep. At Merton in Surrey, at Brighton, at Southampton, all along the east coast of Lincolnshire, and in the low district between the chalk valleys near London and the Wash, artesian borings have long been known, and go by the name of blow-wells among the people of the district. The general level to which the water rises in the London district has been very sensibly raised by the immense number of perforations which have been made; and in several wells where the water formerly rose to the surface, it now requires to be pumped up.

None of the artesian borings in England have reached the depths found in those of the Continent. The average depth of the water-bearing stratum around Paris is six times that of the London chalk beds; and in some parts of Germany and of America, wells have been sunk to colossal depths in search of the water supply. In Chicago and Passy. In Chicago there are several wells more than 2000 ft. deep; and at West Chicago in Dupage county, Illinois, there is one 3081 ft. deep. In the city of St. Louis, Missouri, there is an artesian well 38 ft. deep, yielding a few gallons of salty water (temperature, 165° F); a minute; boring was stopped in September 1868. Among the deepest borings in the world are: a well in Putnam Heights, Windham county, Connecticut, 5604 ft. deep in diameter of 6 ft. in the shallow, rising to 4 ft. from the surface; one at Schlachenbach (5235 ft.), near Leipzig; one 12 m. south-east of Pittsburg, which is 5457 ft. deep and 61 in. in diameter. another at St. Louis, 4350 ft. deep and 6 in. in diameter, yielding gas, oil and salt water; and one (about 4200 ft.) at Spenbergen 20 m. from Berlin, sunk for the purpose of obtaining a supply of rock salt,—the salt deposit here is 9007 ft. thick.

The following are some of the other most important artesian sinkings that have been made. At Louisville, Kentucky, a bore of 3 in. was carried to a depth of 2086 ft. between April 1857 and the 18th March 1858; it yielded 240 gallons per minute rising 170 ft. high. At Charleston, South Carolina, there are: one well 2050 ft. deep and 4 in. in diameter, yielding 450 gallons a minute; another 1495 ft. deep and 4 in. in diameter; and three more each exceeding 1900 ft. in depth. In 1858 a well at Neusalwerk, near Minden, had reached the depth of 2288 ft. At Bourne, Lincolnshire, there is a well 95 ft. deep, which produces a million gallons of water per day; another well in Lawrence county, Alabama, is sufficient to supply the town and force the water to the tops of the highest houses. There is one in Philadelphia (Mount Vernon and 14th Sts.), 5051 ft. deep and 8 in. in diameter, yielding 2600 gallons a minute. There are several deep wells in South Dakota; in Aberdeen City there are two 1300 ft. deep with flows of 1350 and 10000 gallons, respectively, per minute. Two artesian wells at Croydon supply a million gallons of water per day; and Brighton draws over a million gallons from artesian sinkings. There is a well at Bages, near Perpignan, which gives 330 gallons per minute; and one at Tours, which jets about 6 ft. above ground, and gives 237 gallons per minute. One of these wells at Calli, 115 ft. deep, is 3 ft. in diameter; and the other 4 ft. in diameter; they are cost of water for the city and about a dozen other places. The average depth of these is from 160 to 200 ft., and the upper strata have only to be pierced to give a constant supply of water. The artesian system is working a labour for years before they reach the wished-for pool; and with only palm wood as a casing, they have great difficulty in keeping the bore-hole free from silting up. Bore-holes must be cleaned out periodically. Since 1858 an immense number of perforations have been made by French engineers, and the fortuitous effect upon the sandy desert plains has already made very considerable difference.

Kissingen well has a temperature of 66° F, that of St Louis
WELLES—WELLESLEY, MARQUESS

one of 73.8° F. that of Louisville 76° F., and that of Charleston 77° F. The average rate of increase of temperature is 1° for a descent of from 40 to 55 ft. In Hamburg the water of artesian wells is employed to maintain in large manufactories a constant temperature of 47° when it is freezing outside. Artesian waters have also been employed to reduce the extreme variations of temperature in jails.

WELLES, GIDEON (1802-1878), American political leader, was born at Glastonbury, Connecticut, on the 1st of July 1802. He studied for a time at Norwich University, Vermont, but did not graduate. From 1826 to 1837 he edited the Hartford Times, making it the official organ of the Jacksonian Democracy in southern New England. He served in the state House of Representatives in 1827, 1839-40, 1832 and 1834-35, was state comptroller in 1835 and 1834-43, was postmaster at Hartford in 1835-42, and was chief of the bureau of provisions and clothing in the Navy Department at Washington in 1845-49. Leaving the Democratic party on the Kansas-Nebraska issue, he assisted in the formation of the Republican party in Connecticut, and was its candidate for governor in 1856; he was a delegate to the Republican national conventions of 1856 and 1860. On the inauguration of President Lincoln in 1861 he was appointed secretary of the navy, a position which he held until the close of President Andrew Johnson's administration in 1865. Although deficient in technical training, he handled with great skill the difficult problems which were presented by the Civil War. The number of naval ships increased from 1861 and 1865 from 90 to 670, the officers from 13,500 to 67,000, the seamen from 7,000 to 41,500, and the annual expenditure from $12,000,000 to $23,000,000; important changes were made in the art of naval construction, and the blockade of the Confederate ports was effectively maintained. Welles supported President Johnson in his quarrel with Congress, took part in the Liberal Republican movement of 1872, and returning to the Democratic party, warmly advocated the election of Samuel J. Tilden in 1876. He died at Hartford, Connecticut, on the 11th of February 1878.

WELLESLEY, RICHARD COLLEY WESLEY (or WELLESLEY), Marquess (1760-1842), eldest son of the 1st earl of Mornington, an Irish peer, and brother of the famous duke of Wellington, was born on the 20th of June 1760. He was sent to Eton, where he was distinguished as a classical scholar, and to Christ Church, Oxford. By his father's death in 1781 he became earl of Mornington, taking his seat in the Irish House of Peers. In 1784 he entered the English House of Commons as member for Berkshire. Soon afterwards he was appointed a lord of the treasury by Pitt. In 1793 he became a member of the board of control over Indian affairs; and, although he was best known by his speeches in defence of Pitt's foreign policy, he was gaining the acquaintance with Oriental affairs which made his rule over India so effective from the moment when, in 1797, he accepted the office of governor-general. Wellesley seems to have caught Pitt's large political spirit during his intercourse with him from 1793 to 1797. That both had consciously formed the design of acquiring a great empire in India to compensate, at least in part, the loss of the American colonies is not proved; but the rivalry with France, which in Europe placed England at the head of coalition after coalition against the French republic and empire, made Wellesley's rule in India an epoch of enormous and rapid extension of English power. Clive won and Warren Hastings consolidated the British ascendancy in India, but Wellesley extended it into an empire. On the voyage outwards he formed the design of annihilating French influence in the Deccan. Soon after his landing, in April 1798, he learnt that an alliance was being negotiated between Tippoo Sultan and the French republic. Wellesley resolved to anticipate the action of the enemy, and ordered preparations for war. The first step was to effect the disbandment of the French troops entertained by the Nizam of Hyderabad. The invasion of Mysore followed in February 1799, and the campaign was brought to a rapid close by the capture of Seringapatam. In 1803 the restoration of the peshwa proved the prelude to the Maharrta war against Sindhiya and the raja of Berar. The result of these wars and of the treaties which followed them was that French influence in India was extinguished, that forty millions of population and ten millions of inhabitants were added to the British dominions, and that the powers of the Maharrta and all other princes were so reduced that England became the really dominant authority over all India. He found the East India Company a trading body, he left it an imperial power. He was an excellent administrator, and sought to provide, by the foundation of the college of Fort William, for the training of a class of men adequate to the great work of governing India. In connexion with this college he established the governor-general's office, to which civilians who had shown talent at the college were transferred, in order that they might learn something of the highest statesmanship in the immediate service of their chief. A free-trader, like Pitt, he endeavoured to remove some of the restrictions on the trade between England and India. Both the commercial policy of Wellesley and his educational projects brought him into hostility with the court of directors, and he more than once tendered his resignation, which, however, public necessities led him to postpone till the autumn of 1805. He reached England just in time to see Pitt before his death. He had been created an English peer in 1797, and in 1799 an Irish marquess.

On the fall of the fall of Pitt, 1807 Wellesley was invited by George III. to join the duke of Portland's cabinet, but he declined, pending the discussion in parliament of certain charges brought against him in respect of his Indian administration. Resolutions condemning him for the abuse of power were moved in both the Lords and Commons, but defeated by large majorities. In 1809 Wellesley was appointed ambassador to Spain. He landed at Cadiz just after the battle of Talavera, and endeavoured, but without success, to bring the Spanish government into effective co-operation with his brother, who, through the failure of his allies, had been compelled to retreat in Portugal. A few months later, after the duel between Canning and Castlereagh and the resignation of both, Wellesley accepted the post of foreign secretary in Perceval's cabinet. He held this office until February 1812, when he retired, partly from dissatisfaction at the inadequate support given to Wellington by the ministry, but also because he had become convinced that the question of Catholic emancipation could no longer he kept in the background. From early life Wellesley had, unlike his brother, been an advocate of Catholic emancipation, and with the claim of the Irish Catholics to justice he henceforward associated himself. In 1814 he was invited to join Lord Liverpool's administration, and he remained out of office till 1831, criticising with severity the proceedings of the congress of Vienna and the European settlement of 1814, which, while it reduced France to its ancient limits, left to the other great powers the territory that they had acquired by the partition of Poland and the destruction of Venice. He was one of the peers who signed the protest against the enactment of the Corn Laws in 1815. In 1821 he was appointed lord-lieutenant of Ireland. Catholic emancipation had now become an open question in the cabinet, and Wellesley, as the orator of the aristocratic party, declared his wish to see the property of the Catholic church secured. The next opposition was believed in Ireland to herald the immediate settlement of the Catholic claims. The Orange faction was incensed by the firmness with which their excesses were now repressed, and Wellesley was on one occasion mobbed and insulted. But the hope of the Catholics still remained unfulfilled. Lord Liverpool died without having grappled with the problem. Canning in turn passed away; and on the assumption of office by Wellington, who was opposed to Catholic emancipation, his brother resigned the lord-lieutenancy. He had, however, the satisfaction of seeing the Catholic claims settled in the next year by the very statement of the Irish dominions, and in 1833 he resumed the office of lord-lieutenant under Earl Grey, but the ministry soon fell, and, with one short exception, Wellesley did not further take part in official life. He died on the
WELLESLEY—WELLINGTON, 1ST DUKE OF

26th of September 1812. He had no successor in the marquise, but the earldom of Mornington and minor honours devolved on his brother William, Lord Mornington, on the failure of whose issue in 1843 to the 2nd duke of Wellington.

WELLESLEY, a township of Norfolk county, Massachusetts, U.S.A., 14 m. S.W. of Boston. Pop. (1890) 3600, (1900) 5072, of whom 1306 were foreign-born and 17 were negroes, (1910 census) 5413. Area, 104 sq. m. Wellesley is served by the Boston & Albany railway, and is connected with Natick (3 m. W.), Newton, Needham, Boston and Worcester by electric lines. The north-eastern boundary of the township is the Charles river, which divides it from the city of Newton. The surface of the township is hilly and abundantly wooded, with many small streams and lakes; the two principal villages are Wellesley Hills and Wellesley, and smaller villages are Wellesley Falls, Wellesley Farms and Wellesley Falls. The highest point is Maugas Hill (416 ft.), nearest Wellesley Hills village. In the northern part of Wellesley and extending into Weston is a large forest tract known as "The Hundreds." Within the township are parts of two of the reservations of the Metropolitan Park system, 60-07 acres of the Charles river reservation, and 4-58 acres of Hemlock Gorge. Hunnewell Park is the former home of Dr. W. T. G. Morton, who discovered the anaesthetic properties of sulphuric ether. West of Wellesley village, among the hills, lie Moses Hill and Lake Waban, on which are beautiful Italian gardens and (on the north side) the buildings and extensive grounds (350 acres) of Wellesley College (undesignated, 1875) for women, which was established by Henry Towle Durant (1822–1881), a prominent Boston lawyer. In 1916 the college had 150 instructors and 2131 students. The library (65,000 volumes in 1910) was endowed by Eben N. Horsford, the chemist and ethnologist; it contains a library of American linguistics collected by Major J. W. Powell and Mr. Horsford, and the Frances Pearson Plimpton library of early Italian literature. There are about 30 buildings, of which twelve are residential halls or cottages. Instruction is in classical, literary and scientific branches, and the degrees of A.B. and A.M. are awarded.

Wellesley was settled about 1640, being then within the limits of Dedham. When the township of Needham was set off from Dedham in 1711, Wellesley was included within the new territory, and in 1774 was organized as the west parish of Needham or West Needham. In 1881 it was incorporated under its present name.

See J. E. Fiske in D. H. Hart's History of Norfolk County (Boston, 1884).

WELHAUSEN, JULIUS (1844— ), German biblical scholar and Orientalist, was born at Hameln on the Weser, Westphalia, on the 17th of May 1844. Having studied theology at the university of Göttingen under Heinrich Ewald, he established himself there in 1870 as privat-docent for Old Testament history. In 1877 he was appointed professor of oriental theology in Greifswald. Resigning in 1882 owing to conscientious scruples, he became professor extraordinary of oriental languages in the faculty of philology at Halle, was elected professor ordinarius at Marburg in 1885, and was transferred to Göttingen in 1892. Wellhausen made his name famous by his critical investigations into Old Testament history and the composition of the Hexateuch, the uncompromising scientific attitude he adopted in testing its problems bringing him into antagonism with the older school of biblical interpreters. The best known of his works are De gentibus et familia Judaicae (Göttingen, 1870); Der Text des Evangeliums Matthaei (Göttingen, 1871); Die Pharisäer und Sadduzäer (Greifswald, 1874); Prolegomena zur Geschichte Israels (Berlin, 1882; Eng. trans., 1883; 5th German edition, 1890; first published in 1878 as Geschichte Israels); Mohammed in Medina (Berlin, 1882); Die Komposition des Hexateuchs und der historischen Bücher des Alten Testaments (1880, 3rd ed. 1899); Israelitische und jüdische Geschichte (1894, 4th ed. 1901); Reste arabischen Heidentums (1807); Das arabische Reich und sein Sturz (1902); Skizzen und Vorarbeiten (1884–1890); and new and revised editions of F. Bleeck's Einleitung in das Alte Testament (4, 1878–1893). In 1906 appeared Die christliche Religion, mit Einschluss der israelitisch-jüdischen Religion, in collaboration with A. Jülicher, A. Harnack and others. He also did useful and interesting work as a New Testament commentator. He published Das Evangelium Marcus, übersetzt und erklärt in 1903, Das Evangelium Matthäi und Das Evangelium Lucas in 1904, and Einleitung in die drei ersten Evangelien in 1905.

WELLINGBOROUGH, a market and town, in the north-western parishes of Northamptonshire, England, 63 m. N.N.W. from London by the Midland railway; served also by the London & North-Western railway. Pop. of urban district (1901), 18,412. It lies on the declivity of a hill near the junction of the Ise with the Nene, in a pleasant well-wooded district. The church of St Luke is a beautiful building with Norman and Early English portions, but is mainly Decorated, with a western tower and spire. The grammar-schools, founded in 1594 and endowed with the revenues of a suppressed gild, include a school of the second and a school of the third grade, the former a building of regular shape, and the Renaissance style erected in 1888, and the latter a block of the old Elizabethan structure. Another educational endowment is Freeman's school, founded by John Freeman in 1711. There are also several charities. The principal public building is the corn exchange. The town is of some importance as a centre of agricultural trade; but the staple industry is in leather. A great impulse to the prosperity of the town was given by the introduction of the boot and shoe trade, especially the manufacture of uppers. Smelting, brewing and iron-founding are also carried on, as well as the manufacture of portable steam-engines, and iron ore is raised in the vicinity. In 1547 the abbey gave the church of Wellingborough to Crowland Abbey, and the grant was confirmed by King Edgar in 666. In the reign of Edward II. the abbot was lord in full. The town received the grant of a market in 1201. It was formerly famed for the chalybeate springs to which it owes its name, and in 1621 was visited by Charles I. and his queen, who resided in tents during a whole season while taking the waters. It was after its almost total destruction by fire in 1738 that the town was built on its present site on the hill.

WELLINGTON, ARTHUR WELLESLEY, 1ST DUKE OF (1769–1852), 2nd and 1st earl of Mornington, was the fourth son of Garrett (1735–1781) Wellesley or Wellesley, 2nd and 1st earl of Mornington, now remembered only as a musician. He was descended from the family of Colley or Cowley, which had been settled in Ireland for two centuries. The duke's grandfather, Richard Colley, 1st Baron Mornington (d. 1758), assumed the name of Wellesley on succeeding to the estates of Garrett Wesley, a distant relative of the famous divine. In Wellington's early letters the family name is spelt Wesley; the change to Wellesley seems to have been made about 1790. Arthur (born in Ireland in 1769) was sent to Eton, and subsequently to a military college at Angers. He entered the army as ensign in the 73rd Highlanders in 1787, passed rapidly through the lower ranks (in five different regiments), became major of the 33rd (now duke of Wellington's West Riding), and purchased the lieutenant-colonelcy of that regiment in 1793 with money advanced to him by his eldest brother. But in all these changes he did little regimental duty, for he was aide-de-camp to the lord-lieutenant of Ireland for practically the whole of these years. Before reaching full age he was returned to the Irish parliament by the family borough of Trim. Little is known of his history during these years, but neither in boyhood nor in youth do he appear to have made any mark among his contemporaries.

His first experience of active service was in the campaign of 1794–1795, when the British force under the duke of York was driven out of Holland by Pichegru. In 1796 he was sent with his regiment to India, being promoted colonel by brevet about the same time. It was thus as a commanding officer that he learnt

1At 24 Upper Merrion Street, Dublin, or at Dungan Castle, Meath, on the 29th of April or on 1st May; but both place and date are uncertain.
for the first time the details of regimental duty. He mastered them thoroughly, gained a minute acquaintance with every detail of the soldier’s life, learned the precise amount of food required for every mouth, the exact weight that could be carried, the distances that could be traversed without exhaustion, the whole body of conditions in short which govern the military activity of man and beast. It was to the completeness of his practical knowledge that Wellington ascribed in great part his later success. It is probable, moreover, that he at this time made a study of mechanics, hydraulics, science of war, and the theory of war. His formal training at Angers was altogether too slight to account for his great technical knowledge; no record, however, exists of the stages by which this was acquired except that as soon as he landed in India he began to devote fixed hours to study, giving up cards and the violin. This study was directed chiefly to the political situation of India, and when on his advice his eldest brother, Lord Mornington, afterwards Marquess Wellesley, accepted the governor-generalship of India, he became his trusted though unofficial adviser. In the war with Tippoo Saib the 32nd was attached to the Nizam’s contingent, and Colonel Wellesley commanded this division in the army of General (Lord) Harris. Though his military services in this short campaign were not of a striking character, he was appointed by his brother to the supreme military and political command in Mysore, in spite of the claims of his senior, Sir David Baird.

His great faculties now for the first time found opportunity for their exercise. In the settlement and administration of the conquered territory he rapidly acquired the habits and experiences of a statesman, while his military operations against Doodah, a robber chief, were conducted with extraordinary energy and success, Doodiah being killed and his army scattered. More important, however, than the military side of these operations was their political character. When pressed in Mysore, Doodiah moved into Mahrratta territory, whither Wellesley followed him. Here, negotiating and bargaining with the Mahrratta chiefs, Wellesley acquired a knowledge of their affairs and an influence over them such as no other Englishman possessed. Simple and honourable himself, he was shrewd and penetrating in his judgment of Orientals; and, unlike his great predecessor Clive, he rigidly adhered to the rule of good faith in his own actions and as regards the conduct of those with whom he had to deal. The result of Wellesley’s singular personal ascendancy among the Maharrrats came into full view when the Mahrratta War broke out. In the meantime, however, his Indian career seemed likely to be sacrificed to the calls of warfare in another quarter. Wellesley was ordered in December 1800 to take command of a body of troops collected for foreign service at Trincomalee, in Ceylon. It was at first intended that these troops should act against Java or Mauritius; their destination was, however, altered to Egypt, with a view to co-operation with Sir Ralph Abercromby’s expedition, and Baird was placed in command. Though deeply mortified at the loss of the command, Wellesley in his devotion to duty moved the troops on his own responsibility from Trincomalee to Bombay, from the conviction that, if they were to be of any use in Egypt, it was absolutely necessary that they should provision at Bombay without delay. But at Bombay Wellesley was attacked by fever, and prevented from going on. The troop-ship in which he was to have sailed went down with all on board.

He returned in May 1801 to Mysore, where he remained until the Mahrratta War broke out. The power of the Peshwa, nominally supreme in the Mahrratta territory, had been overthrown by his rivals Holkar and others, and he had himself fled. The Indian government undertook to restore his authority. Wellesley, now a major-general, was placed in command of a division of the army charged with this task. Starting from Seringapatam, he crossed the frontier on March 12, 1803, and moved through the southern Mahrratta territory on Poona. The march was one unbroken success, thanks to Wellesley’s forethought and sagacity in dealing with the physical conditions and his personal and diplomatic ascendancy among the chieftains of the district. No hand was raised against him, and a march of 600 m. was conducted without even a skirmish. Wellesley had intended to reach Poona on the 23rd of April. On the night of the 18th he heard that a rival of the Peshwa intended to burn the city. At once Wellesley pressed on with the cavalry and an infantry battalion in light order, and after a forced march of 32 hours entered Poona on the afternoon of the 20th, in time to save the city. The Peshwa was now restored, and entered into various military obligations with Wellesley, which he very imperfectly fulfilled.

In the meantime Sindia and Holkar, with the raja of Berar, maintained a doubtful but threatening aspect farther north. It was uncertain whether or not a confederacy of the northern Mahrrattas had been formed against the British Government. In these critical circumstances Wellesley was charged with “the general direction and control of military and political affairs in the territories of the Nizam, the Peshwa and the Mahrratta states and chiefs.” Armed with these powers, he required Sindia, as a proof of good faith, to withdraw to the north of the Nerbudda. Sindia, however, still held on. When, on the 6th of August 1803, Wellesley marched towards his capital, Sindia, on the 11th, crossed the Godavery ten days later, and moved against the combined forces of Sindia and the raja of Berar. Colonel Stevenson was meanwhile approaching with a second division from the east, and it was intended that the two should unite. On the 23rd of September Wellesley supposed himself to be still some miles from the enemy; he suddenly found that the entire forces of Sindia and the raja of Berar were close in front of him at Assaye. Weighing the dangers of delay, of retreat, and of an attack with his single division of 4500 men, supported only by 5000 native elephants of doubtful quality, Wellesley convinced himself that an immediate attack, though against greatly superior forces (30,000 horse, 10,000 European-drilled infantry and 100 well-served guns) in a strong position, was the wisest course. He threw himself upon the Mahrratta host, and, carrying out a bold manoeuvre under an intense fire, ultimately gained a complete victory, though with the loss of 2500 men out of a total probably not much exceeding 7000. In comparison with the battle of Assaye, all fighting that had hitherto taken place in India was child’s play. Wellesley himself had two horses killed under him. Uniting with Stevenson’s division, the conqueror followed up the pursuit, and brought the war to a close by a second victory at Argaum on the 29th of November, and the storming of Gawilghur on the 13th of December. The treaties with Sindia and the raja of Berar, which marked the downfall of the Mahrratta power, were negotiated and signed by Wellesley (who was made K.B. in Sept. 1804) in the course of the following month. Not yet thirty-five years old, he had proved himself a master in the sphere of Indian state management and diplomacy as on the field of battle. Had his career ended at this time, his Indian despatches alone would have proved him to have been one of the wisest and strongest heads that have ever served England in the East.

His ambitions now led him back to Europe, and in the spring of 1805 he quitied India. On his return home he was immediately sent on the abortive expedition to Hanover. In 1806 he was elected M.P. for Rye, in order to defend his brother, the governor-general, in the House, and in the following year he was Irish secretary for a few months. He was then employed in the expedition against Copenhagen, in which he defeated the Danes in the action of Kjøge (29th Oct.). In 1808, however, began the war (see Peninsular War) in which his brother had been so successfully established. In April he was promoted lieutenant-general and placed in command of a division of the troops destined to operate against the French in Spain or Portugal. The conduct of events is narrated in a separate article, and need only be summarized here. Finding that the junta of Corunna wished for no foreign soldiery, he followed his alternative instructions to act against Junot at Lisbon. He landed at Mondego Bay in the first week of August, and moved southwards, driving in the enemy at Roliça on the 17th of August. On the 21st the battle of Vimeiro was fought and won. In the midst of this
engagement, however, Sir Harry Burrard landed, and took over the command. Burrard was in turn superseded by Sir Hew Dalrymple, and the campaign ended with the convention of Cintra, which provided for the evacuation of Portugal by the French, but gave Junot's troops a free return to France. So great was the public displeasure in England at the escape of the enemy that a court of inquiry was held. After the battle of Corunna, Wellesley, who had in the meantime resumed his duties as Irish secretary, returned to the Peninsula as chief in command. He drove the French out of Oporto by a singularly bold and determined march, and then proceeded to march against Madrid by the valley of the Tagus. He had the support of a Spanish army under General Cuesta; but his movements were delayed by the neglect of the Spanish government, and Soult was able to collect a large force for the purpose of falling upon the English line of communication. Wellesley, unconscious of Soult's presence in force on his flank, advanced against Madrid, and defeated his immediate opponent, King Joseph, at Talavera de la Reina (g.v.) on the 27th-28th of July. The victory of Talavera, however, brought prestige but nothing else. Within the next few days Soult's approach of the English and Spanish forces were each reduced and Wellesley, disgusted with his Spanish allies, had no choice but to withdraw into Portugal and there stand upon the defensive.

A peacemaking with the title of Viscount Wellington and Baron Douro, was conferred upon him for Talavera. He was also made marshal-general of the Portuguese army and a Spanish captain-general. But his conduct after the battle was sharply criticized in England, and its negative results were used as a weapon against the ministry. Even on the defensive, Wellington's task was exceedingly difficult. Austria having made peace, Napoleon was at liberty to throw back his forces into the Peninsula. Wellington, foreseeing that Portugal would now be invaded by a very powerful army, began the fortification of the celebrated lines of Torres Vedras (see FORTIFICATION). The English army wintered about Almeida. A summer approach Wellington's anticipations were realized. Masséna moved against Portugal with an army of 70,000 men. Wellington, unable to save Ciudad Rodrigo, retreated down the valley of the Mondego, devastating the country, and at length halted at Busaco and gave battle. The French attack was repulsed, but other roads were open to the invader, and Wellington continued his line of camouflaged retreat. But was extricated from the lines of the French, and he sought in vain for an unprotected point. It was with the utmost difficulty that he could keep his army from starving. At length, when the country was exhausted, he fell back to Santarem, where, Wellington being still too weak to attack, he maintained himself during the winter. But in the spring of 1811 Wellington received reinforcements and moved forward. Masséna retreated, devastating the country to check the pursuit, but on several occasions his rearguard was deeply engaged, and such were the sufferings of his army, both in the invasion and in the retreat, that the French, when they re-entered Spain, had lost 30,000 men. Public opinion in England, lately so hostile, now became confident, and Wellington, whose rewards for Talavera had been opposed in both Houses, began to gain extraordinary popularity. In the meantime Soult, who was besieging Cadiz, had moved to support Masséna. But after capturing Badajoz, Soult learnt that Masséna was in retreat, and also that his own forces at Cadiz had been beaten. He in consequence returned to the south. Wellington, freed from pressure on this side, and believing Masséna to be thoroughly disabled, considered that the time had come for an advance into Spain. The fortresses of Almeida, Ciudad Rodrigo and Badajoz barred the roads. Almeida was besieged, and Wellington was preparing to attack Badajoz when Masséna again took the field, and marched to the relief of Almeida. The battle of Fuentes d'Oñoro followed, in which Wellington was only able to extricate the army from a dangerous predicament which "if Boney had been there" would have been a disaster. The garrison of Almeida too escaped, after blowing up part of the fortress. In the south, in spite of the hard-won victory of Albuera, the English attack on Badajoz had to be given up. The same misfortune attended a fresh stroke against Ciudad Rodrigo, and at the end of a campaign in which he had used all his skill and care to compensate for inferior numbers, he withdrew behind the Coa. He had meanwhile been given the local rank of general and had also received the Portuguese title of Conde de Vimeiro.

Wellington had from the first seen that, whatever number of men Napoleon might send against him, it was impossible, owing to the poverty of the country, that any great mass of troops could long be held to either attack or defend. Wellington, "the war support war," would fare worse in such conditions than his own troops with their organized supply service. It was so at the end of 1811. Soult had to move southwards to live, and the English were again more than a match for the enemy in front of them. Wellington resumed the offensive, and on the 19th of January 1812 Ciudad Rodrigo was taken by storm. Again, suddenly altering the centre of gravity, Wellington invested Badajoz in the middle of March. It was necessary at whatever cost to anticipate the arrival of Soult with a relieving army, and on the 6th of April Wellington ordered the assault. The feints to throw pressure towards Madrid, the British were masters of the defences caused Wellington to be charged with indifference to loss, but a postponement of the attack would merely have resulted in more battles against Soult. Of all generals Wellington was the last to waste a single trained man, and the sight of the breaches in Badajoz after the storm for a moment unnerved even his iron sternness.

The advance from Ciudad Rodrigo into Spain was now begun. Marmont, who had succeeded Masséna, fell back to the Douro, but there turned upon his assailant, and, by superior swiftness, threatened to cut the English off from Portugal. Wellington was faced with the necessity of using his army at a critical moment, and it was at Salamanca (g.v.) that there extricated himself from his peril by a most brilliant victory (July 22). The French fell back on Burgos. Instead of immediately following them, Wellington thought it wise to advance upon the Spanish capital. King Joseph retired, and the English entered Madrid in triumph.

Wellington's political effect was great, but the delay gave the French northern army time to rally. "The vigorous following of a beaten enemy was not a prominent characteristic of Lord Wellington's warfare," as Napier says. Burgos offered an obdurate defence. Moreover, Soult, raising the siege of Cadiz, and gathering other forces to throw pressure towards Madrid, Wellington was compelled once more to retire into Portugal. The effect of the campaign was, however, that the southern provinces were finally cleared of the invader. During this retreat he announced in general orders that the demoralization and misconduct of the British army surpassed anything that he had ever witnessed. Such wholesale criticism was bitterly resented, but indeed throughout his career Wellington, cold and punctilious, never secured to himself the affections of officers and men as Marlborough or Napoleon did. He subjugated his army and gave it brilliant victories, but he inspired few disciples except the minister as his own staff. To the end of his life his relations with the principal generals who served under him were by no means intimate.

Wellington had been made an earl after the fall of Ciudad Rodrigo, and the Spanish government created him duke of Ciudad Rodrigo about the same time. For Salamanca his reward was a marquessate, and a grant of £100,000 for the purchase of an estate. He was also made Duque da Victoria by the Portuguese regency, and before the opening of the campaign of 1813, which was to crown his work, he was given both the Garter and the Golden Fleece. He was now invested with the supreme command of the Spanish armies. He visited Cadiz in December 1812, and offered counsels of moderation to the democratic assembly, which were not followed. During the succeeding months he was occupied with plans and preparations, and at length, in May 1813, the hour for his final and victorious advance arrived. The Russian disasters had compelled Napoleon to withdraw some of his best troops from the Peninsula. Against a weakened and discouraged adversary Wellington took the field with greatly increased
numbers and with the utmost confidence. The advance of the allied army was irresistible. Position after position was evacuated by the French, until Wellington, driving everything before him, came up with the retreating enemy at Vittoria (June 21st). Soulé's combusts in the Pyrenees, and the desperate resistance of St Sebastian, prolonged the struggle through the autumn, and cost the English thousands of men. But at length the frontier was passed, and Soulé forced back into his entrenched camp at Bayonne. Both armies now rested for some weeks, during which interval Wellington gained the confidence of the successful result of his unvarying reproof of marauding, his business-like payment of expenses, and the excellent discipline which he maintained. In February 1814 the advance was renewed. The Adour was crossed, and Soulé was defeated at Orthes. At Toulouse, after the allies had entered Paris, but before the abdication of Napoleon had become known, the last battle of the war was fought. Peace being proclaimed, Wellington took leave of his army at Bordeaux, and returned to England, where he was received with extraordinary honours, created duke of Wellington, and awarded a most of the colonies of the East India Company.

After the treaty of Paris (May 30) Wellington was appointed British ambassador at the French capital. During the autumn and winter of 1814 he witnessed and reported the mistakes of the restored Bourbon dynasty, and warned his government of the growing danger from conspiracies and from the army, which was visibly hostile to the Bourbons. His insight, however, did not extend beyond the circumstances immediately before and around him, and he failed to realize that the great mass of the French nation was still with Napoleon at heart. He remained in France until February 1815, when he took Lord Castlereagh's place at the congress of Vienna. All the great questions of the congress had already been settled, and Wellington's diplomatic work here was not of importance. His imperceptible acquaintance with French feeling was strikingly proved in the despatch which he sent home on learning of Napoleon's escape from Elba. "He has acted," he wrote, "upon false or no information, and the king (Louis XVIII) will destroy him without difficulty and in a short time." Almost before Wellington's unfortunate prediction could reach London, Louis had fled, and France was at Napoleon's feet. The ban of the congress, however, went out against the common enemy, and the presence of Wellington at Vienna was to impress the allies at once to decide upon their plans for the campaign. To Wellington and Blücher were committed the invasion of France from the north, while the Russians and Austrians entered it from the east. Wellington, with the English troops and their Dutch, German and Belgian allies, took his post in the Netherlands, guarding the country west of the Charleroi road. Blücher, with the Prussians, lay between Charleroi, Namur and Liège. In the meantime Napoleon had outstripped the preparations of his adversaries. By the 13th of June he had concentrated his main army on the northern frontier, and on the 14th crossed the Sambre. The four days' campaign that followed, and the crowning victory of the 18th of June, are described in the article WATERLOO CAMPAIGN. Wellington's reward was a fresh grant of £200,000 from parliament, the title of prince of Waterloo and great estates from the king of Holland, and the order of the Saint-Ésprit from Louis XVIII.

Not only the prestige of his victories, but the chance circumstances of the moment, now made Wellington the most influential personality in Europe. The emperors of Russia and Austria were still far away at the time of Napoleon's second abdication, and it was with Wellington that the commissioners of the provisional government opened negotiations preliminary to the surrender of Paris. The duke well knew the peril of delaying the decision as to the government of France. The emperor Alexander was hostile to Louis XVIII, and the Bourbons generally; the emperor Francis might have been tempted to support the cause of Napoleon's son and his own grandson, who had been proclaimed in Paris as Napoleon II.; and if the restoration of Louis—which Wellington believed would alone restore permanent peace to France and to Europe—was to be effected, the allies must be confronted on their arrival in Paris with the accomplished fact. He settled the affair in his usual downright manner, telling the commissioners bluntly that they must take back their legitimate king, and refusing—perhaps with more questionable wisdom—to allow the retention of the tricolour flag, which to him was a "symbol of rebellion." At the same time the opposition of the most influential member of the commission and the most powerful man in France, Fouché, was overcome by his appointment, on Wellington's suggestion, as minister of police. The result was that when the emperor Alexander arrived in Paris he found Louis XVIII. already in residence in the Tuileries, and the problem before the allies was merely how to keep him there.

In the solution of this problem the common sense of Wellington and of Castlereagh, with whom the duke worked throughout in complete harmony, played a determining part; it was mainly owing to their influence that France escaped the dismemberment for which the German powers clamoured, and which was advocated for a while by Lord Liverpool and the majority of the British cabinet. Wellington realized the supreme necessity, in the interests of the Allies and of the prestige of France, of preventing any final dismemberment of the country, which such a dismemberment would have irretrievably damaged. It was this conviction that inspired his whole attitude towards French affairs. If he unwillingly refused to intervene in favour of Marshal Ney, it was because he believed that so conspicuous an example of treason could not safely be allowed to go unpunished. If he bore in silence the odium that fell upon him owing to the break-up of the collection of the Louvre, it was because he knew that it would be fatal to allow it to be known that the first initiative in the matter had come from the king. In the same spirit he carried out the immense and unique trust imposed upon him by the allies when they placed him in command of the international army by which France was to be occupied, under the terms of the second peace of Paris, for five years. By the terms of his commission he was empowered to act, in case of emergency, without waiting for orders; he was, moreover, to be kept informed by the French cabinet of the whole course of business. His power was immense, and it was well and wisely used. If he had no sympathy with revolutionary disturbers of the peace, he had even less with the fatuous extra-English revolutionary spirit. He was against the demand of the French republic for the reduction of the powers of the restored monarchy, which his influence was thrown into the scale of the moderate constitutional policy of which Richelieu and Decazes were the most conspicuous exponents. The administrative duties connected with the army of occupation would alone have taxed to the uttermost the powers of an ordinary man.1 Besides this, his work included the reconstruction of the military frontier of the Netherlands, and the conduct of the financial negotiations with Messrs Baring, by which the French government was able to pay off the indemnities due from it, and thus render it possible for the powers to reduce the period of armed occupation from five years to three. He was consulted, moreover, in all matters of international importance, notably the affairs of the Spanish colonies, in which he associated himself with Castlereagh in pressing those views which were afterwards carried into effect by George Canning.

The length of time during which France was to be occupied by the allies practically depended upon Wellington's judgment. On the 10th of December 1815 Pozzo di Borgo wrote to the duke enclosing a memorandum in which the emperor Alexander suggested a reduction in the army of occupation: "no more question of finance, but one of general policy, based on reason, equity and a severe morality"; at the same time he left the question of its postponement entirely to Wellington. To

1 Isolated fortresses were still holding out for Napoleon in September 1815, e.g. Longwy, which surrendered on the 20th. Much trouble was caused by the behaviour of some of the allied troops. Only the Dutch and British were all the time occupied of the country for the first months of the occupation are contained in the Bulletins de la correspondance de l'Intérieur, copies of which are preserved in the Foreign Office records (F.O. Congress. Paris. Castlereagh, August, &c., 1815).
Wellington, the proposal seemed premature; he would prefer to wait till “the assembly had published its conduct by its acts”1; for if the new chambers were to prove as intractable as the dissolved Chambre introuvable, the monarchy would not be able to dispense with its foreign tutors. To Castlereagh he wrote (December 11, 1816) that although he believed that the common people of the departments occupied, particularly those occupied by us,“were delighted,” he had determined the allies to make among them, among the official and middle classes the feeling was very different. In view of the weakness of the king’s government, to reduce the army would be to expose the excitable elements of the population to the temptation of attacking it. “Suppose I or my officers were forced to take military action. Suppose this were to happen in the Prussian cantonments. The whole Prussian army would be put in motion, and all Europe would resound with the alarm of the danger to be apprehended from the Jacobins in France.”2

The events of the next few months considerably modified his opinions in this matter. The new chambers proved their trustworthy quality by passing the budget, and the army of occupation was reduced by 30,000 men. Wellington now pressed for the total evacuation of France, pointing out that popular irritation had grown to such a pitch that, if the occupation were to be prolonged, he must concentrate the army between the Scheldt and the Meuse, as the forces, stretched in a thin line across France, were no longer safe in the event of a popular rising. But such a concentration would in itself be attended with great risk, as the detachments might be destroyed piecemeal before they could be assembled into a whole. Wellington still hoped that the immediate evacuation of France the principal subject of discussion at the congress which it was arranged to hold at Aix-la-Chapelle in the autumn of 1818. Here Wellington supported the proposal for the immediate evacuation of France, and it was owing to his common-sense criticism that the proposal of Prussia, supported by the emperor Alexander and Metternich, to establish an “army of observation” at Brussels, was nipped in the bud. The conduct of the final arrangements with Messrs Barrié and Hope, which made a definitive financial settlement between France and the allies possible, was left entirely to him.3

On Wellington’s first entry into Paris he had been received with popular enthusiasm, but he had soon become intensely unpopular. He was held responsible not only for the occupation itself, but for every untoward incident to which it gave rise; even Blücher’s attempt to blow up the Pont de Jena, which he had prevented, was laid to his charge. His characteristically British temper was wholly unsympathetic to the French, whose sensibility was irritated by his cold and slightly contemptuous attitude. Two attempts were made to assassinate him. After the second the prince regent commanded him to leave Paris and proceed to the headquarters at Cambrai.4 For the first time the duke disobeyed orders; the case, he wrote, was one in which he was “principally and personally concerned,” and he alone was in a position to judge what line of action he ought to pursue. His work in Paris, however, was now finished, and on the 30th of October, in a final “order of the day,” he took leave of the international troops under his command. On the 23rd of October, while still at Aix, he had received an offer from Lord Liverpool of the office of master-general of the ordinance, with a seat in the cabinet. He accepted, though with some reluctance, and only on the condition that he should be at liberty, in the event of the Tories going into opposition, to take any line he might think proper.

For the next three years “the Duke” was little before the world. He supported the repressive policy of Liverpool’s cabinet, and organized the military forces held ready in case of a Radical rising. It was his influence with George IV. that led to the readmittance of Canning to the cabinet after the affair of the royal divorce had been settled. It was only in 1822, however, that the tragic death of his friend Londonderry (Castlereagh) brought him once more into international prominence. Londonderry had been on the eve of starting for the conference at Vienna, and the instructions which he had drawn up for his own guidance were handed over by Canning, the new foreign secretary, to Wellington, who proceeded in September to Vienna, and thence in October to Verona, whether the conference had been adjourned. Wellington’s official part at the congress is outlined elsewhere (see Verona, Congress of). Unofficially, he pointed out to the French plenipotentiaries, arguing from Napoleon’s experience, the extreme danger of an invasion of Spain, but at the same time explained, for the benefit of the duke of Angoulême, the best way to conduct a campaign in the Peninsula.

Wellington’s intimate association for several years with the sovereigns and statesmen of the Grand Alliance, and his experience of the evils which the Alliance existed to hold in abeyance naturally led him to dislike Canning’s aggressive attitude towards the autocratic powers, and to view with some apprehension his determination to break with the European concert. He realized, however, that in the matter of Spain and the Spanish colonies the British government had no choice, and in this question he was in complete harmony with Canning. This was also at first the case in respect to the policy to be pursued in the Eastern Question raised by the war of Greek independence. Both Canning and Wellington were anxious to preserve the integrity of Turkey, and therefore to prevent any isolated intervention of Russia, and Wellington seemed (Canning disagreed) to use the alliance of France and Russia as an instrument for the purpose of securing an arrangement between Great Britain and Russia on the Greek question, through which it was hoped to assure peace in the East. In February 1826, accordingly, the duke was sent to St Petersburg, ostensibly to congratulate the emperor Nicholas I. on his accession, but more especially—to use Wellington’s own words—to “induce the emperor of Russia to put himself in our hands.”5 In this object he signally failed. He was, indeed, received in St Petersburg with all honour; but as a diplomatist the “Iron Duke”—whom Nicholas, writing to his brother Canning, described as “cold and broken (casse)”6—was no match for the “Iron Tsar.” As for the Greeks, the emperor said bluntly that he took no interest in “ces messieurs,” whom he regarded as “rebels”; his own particular quarrel with Turkey, arising out of the non-fulfilment of the treaty of Bucharest, was the concern of Russia alone; the ultimatum to Turkey had, indeed, been prepared before Wellington’s arrival, and was despatched during his visit. Under stress of the imminence of the peril, Nicholas was at no pains to conceal, the duke was driven from concession to concession, until at last the tsar, having gained all he wanted, conceded to come to an arrangement with Great Britain in the Greek question. On the 4th of April was signed the Protocol of St Petersburg, an instrument which—as events were to prove—fettered the free initiative not of Russia, but of Great Britain (see Turkey: History; Greece: History).7

After the death of the duke of York on the 5th of December 1826 the post of commander-in-chief was conferred upon Wellington. His relations with Canning had, however, become increasingly strained, and when, in consequence of Lord Liverpool’s illness, Canning in April 1827 was called to the head of the administration, the duke refused to serve under him. On the day after the resignation the duke sat in the cabinet he also resigned his offices of master of the ordnance and commander-in-chief, giving as his reason “the tone and temper of Mr Canning’s letters,” though it is difficult to see in these letters any adequate reason for such a course (see Maxwell’s Life, ii. 190). The effect of his withdrawal was momentous in its bearing upon Eastern affairs. Canning, freed from Wellington’s restraint, carried his intervention on behalf of Greece a step further, and 8 Memorandum to Canning of January 26, 1826 (Well. Despatches ii. 335).

concluded, on the 27th of July, the treaty of London, whereby France, England and Russia bound themselves to put an end to the conflict in the East and to enforce the conditions of the St. Petersburg protocol upon the belligerents. Against this treaty Wellington protested, on the ground that it "specified means of compulsion which were neither more nor less than measures of war." His apprehensions were fulfilled by the battle of Navarino. Wellington died on the 5th of August 1852, and was succeeded as premier by Lord Goderich. The duke was at once again offered the post of commander-in-chief, which he accepted on the 17th of August. On the fall of Lord Goderich's cabinet five months later Wellington became prime minister. He had declared some time before that it would be an act of madness for him to take this post; but the sense of public duty led him to accept it when it was pressed upon him by the king. His cabinet included at the first Huskisson, Palmerston and other followers of Canning. The repeal of the Test and Corporation Acts having been carried in the House of Commons in the session of 1828, Wellington, to the great disappointment of Tories like Lord Eldon, recommended the House of Lords not to offer further resistance, and the measure was accordingly carried through. Soon afterwards a quarrel between the duke and Huskisson led to the retirement from the ministry of all its liberal members. It was now hoped by the so-called Protestant party that Wellington, at the head of a more united cabinet, would offer a steady resistance to Catholic emancipation. Never were men more bitterly disappointed. The Clare election and the progress of the Catholic Association convinced both Wellington and Peel that the time had come when Catholic emancipation must be granted; and, submitting when further resistance would have led to civil war, the ministry itself brought in at the beginning of the session of 1829 a bill for the relief of the Catholics. Wellington, who had hitherto always opposed Catholic emancipation, explained and justified his change of front in simple and impressive language. His undoubted seriousness and his immense personal reputation did not, however, save him from the excesses of calumny and misinterpretation; and in order to impose some moderation upon his aspersers the duke thought it necessary to send a challenge to one of the most violent of these, the earl of Winchelsea. No mischief resulted from the encounter.

Catholic emancipation was the great act of Wellington's ministry; in other respects his tenure of office was not marked by much success. The imagination and the breadth of view necessary to a statesman of the highest order were not part of his endowment, nor had he the power of working harmoniously with his subordinates. His Eastern policy was singularly short-sighted. There might have been good reason, from Wellington's point of view, for confining the fleets of Britain and France to the Mediterranean, and allowing the Turks to conquer Greece; but when, in consequence of this treaty, the battle of Navarino had been fought, the Turkish fleet sunk, and the independence of Greece practically established, it was the weakest of all possible courses to withdraw England from its active intervention, and to leave to Russia the gains of a private and isolated war. This, however, was Wellington's policy; and, having permitted Russia to go to war alone in 1828, nothing remained for him but to treat Greece as a pawn in Russia's hands, and to cut down the territory of the Greek kingdom to the narrowest possible limits, as if the sullen resistance to this determination, carried, an inaccessible mountain-tract, inhabited by the bitterest of his enemies, could permanently add to the strength of the Ottoman empire. The result was the renunciation of the Greek crown by Prince Leopold; and, although, after the fall of Wellington's ministry, a somewhat better frontier was given to Greece, it was then too late to establish this kingdom in adequate strength, and to make it, as it might have been made, a counterpoise to Russia's influence in the Levant. Nor was the indulgence shown by the cabinet towards Dom Miguel and the absolutists of Portugal quite worthy of England. That Wellington actively assisted despotic governments against the constitutional movements of the time is not true. He had indeed none of the sympathy with national causes which began to influence British policy under Canning, and which became so powerful under Palmerston; but the rule which he followed in foreign affairs, so far as he considered it possible, was that of non-intervention. As soon as Catholic emancipation was carried, the demand for parliamentary reform and extension of the franchise agitated Great Britain from end to end. The duke was ill informed as to the real spirit of the nation. He conceived the agitation for reform to be a purely fictitious one, worked up by partisans and men of disorder in their own interest, and expressing no real want on the part of the public at large. Met with a firm resistance, it would, he believed, vanish away, with no worse result than the possible plunder of a few houses by the city mobs. Wholly unaware of the strength of the forces which he was provoking, the duke, at the opening of the parliament which met after the death of George IV., declared against any parliamentary reform whatever. This declaration led to the immediate fall of his government. Lord Grey, the chief of the new ministry, brought in the Reform Bill, which was resisted by Wellington as long as anything was to be gained by resistance. When the creation of new peers was known to be imminent, however, Wellington was among those who counselled the abandonment of a hopeless struggle. His opposition to reform made him for a while unpopular. He was hoisted by the mob on the anniversary of Waterloo, and considered it necessary to protect the windows of Apsley House with iron shutters.

For the next two years the duke was in opposition. On the removal of Lord Althorp to the House of Lords in 1834, William IV. unexpectedly dismissed the Whig ministry and requested Peel to form a cabinet. Wellington thought that Peel should be at the head of the government, and served under him, during the few months that his ministry lasted, as foreign secretary. On Peel's later return to power in 1841 Wellington was again in the cabinet, but without departmental office beyond that of commander-in-chief. He supported Peel in his Corn-Law legislation, and throughout all this later period of his life, whether in office or in opposition, gained the admiration of discerning men, and excited the wonder of vagabonds, by his habitual subordination of party spirit and party connexion to whatever appeared to him the real interest of the nation. On Peel's defeat in 1846 the duke retired from active public life. He was now nearly eighty. His organization of the military force in London against the Chartists in April 1848, and his letter to Sir John Burgoyne on the defences of the country, proved that the old man had still something of his youth about him. But the general character of Wellington's last years was rather that of the old age of a great man idealized. To the unbroken splendours of his military career, to his honourable and conscientious labours as a parliamentary statesman, life unusually serene and calm. The passions excited during the stormy epoch of the Reform Bill had long passed away. Venerated and beloved by the greatest and the lowest, the old hero entered, as it were, into the immortality of his fame while still among his countrymen. Death came to him at last in its gentlest form. He passed away on the 14th of September 1852, and was buried under the dome of St. Paul's, in a manner worthy both of the nation and of the man. His monument, by Alfred Stevens (q.v.), stands in the nave of the cathedral.

Alexander H. Mac Nicol--The Wellington Despatches, edited by Gurwood; Supplementary Despatches; and Wellington Despatches, New Series, edited by the second duke of Wellington. Unlike Napoleon's despatches and correspondence, everything from Wellington's pen is absolutely trustworthy: not a word is written for effect, and no fact is misrepresented. Almost all the political memoirs of the period 1830-1850 contain more or less about Wellington in his later life. Those of Greville and Croker have perhaps most of a good deal of this kind of Russian archives, is given in F. de Maret's Recueil des traités conclus par la Russie. See also Sir Herbert Maxwell, Life of Wellington (2 vols., London, 1881): and the general literature of the Peninsula War (q.v.).

WELLINGTON, a town of Wellington county, New South Wales, Australia, 248 m. by rail N.W. of Sydney. Pop. (1901) 2988. The river Macquarie is here spanned by a fine railway bridge. There are rich gold-bearing reefs in the vicinity of the
town and gold dredging is a growing industry; wheat growing is the most considerable agricultural pursuit, but fruit trees and vines are cultivated with success. Stock-rearing also is extensively followed on account of the fine pastureage in the district.

In the vicinity are several fine churches, and among educational institutions the chief is the Victoria University. An excellent school of art and several public libraries are provided, the latter including that in the house of parliament. The museum contains a beautiful Maori house of carved woodwork, and botanical collections. There are several public parks and gardens on well-chosen elevated sites, the principal being the Botanical Garden, from which the city and port are well seen. Shipping is controlled by a harbour board (1880). The extensive wharves are amply served by hydraulic machinery and railways. Wellington was founded in 1840, being the first settlement of New Zealand colonists, and the seat of government was transferred here from Auckland in 1865. The town is under municipal government.

WELLS, CHARLES JEREMIAH (1798–1879), English poet, was born in London, probably in the year 1798. He was educated at Cowden Clarke’s school at Edmonton, with Tom Keats, the younger brother of the poet, and with R. H. Horne. He became acquainted with John Keats, and was the friend “who sent me some roses,” to whom Keats wrote a sonnet on the 29th of June 1816—

>“When, O Wells! thy roses came to me,
My sense with their deliciousness was spelt;
Some roses had they, that, with tender plea,
Whisper’d of peace and truth and friendliness unquelled.”

Unfortunately, Wells soon afterwards played a cruel practical joke on the dying Tom Keats, and reappears in the elder poet’s correspondence as “that degraded Wells.” Both with Keats and Reynolds, Wells was in direct literary emulation, and his early writings were the result of this. In 1822 he published _Stories after Nature_—or rather, in the manner of Boccaccio, tempered by that of Leigh Hunt—a curious little volume of brocaded prose. At the close of 1823, under the pseudonym of H. L. Howard, appeared the Biblical drama of _Joseph and his Brethren_ (dated 1824). For the next three years Wells, like Hazlitt, as he said, “every night,” but in 1827 the two men were estranged. When Hazlitt died, in September 1830, Wells took Horne to see his dead friend, and afterwards raised a monument to the memory of Hazlitt in the church of St Anne’s, Soho. His two books passed almost unnoticed, and although Hazlitt said that _Joseph and his Brethren_ was “more than original, aboriginal, and a mere experiment in comparison with the vast things” Wells could do, he forbore to review it, and even disowned the young poet from writing any more. Wells was now practising as a solicitor; and when he fancied that he was failing and proceeded to South Wales, where he occupied himself with shooting, fishing and writing poetry until 1835, when he removed to Broxbourne, in Hertfordshire. In 1840 he left England, never to set foot in it again. He settled at Quimper, in Brittany, where he lived for some years. A story called _Claribel_ appeared in 1845, and one or two slight sketches later, but several important tragedies and a great deal of miscellaneous verse belonging to these years are lost. Wells stated in a letter to Horne (November 1877) that he had composed eight or ten volumes of poetry during his life, but that, having in vain attempted to find a publisher for any of them, he burned the whole mass of MSS. at his wife’s death. The only work he had retained was a revised form of _Joseph and his Brethren_, which was praised in 1838 by Wade, and again, with great warmth, by Horne, in his _New Spirit of the Age_, in 1844. The drama was then once more forgotten, until in 1863 it was read and vehemently praised by D. G. Rossetti. The tide turned at last; _Joseph and his Brethren_ became a kind of shibboleth—a rite of initiation into the true poetic culture—but still the world at large remained indifferent. Finally, however, Swinburne wrote an eloquent study of it in the _Fortnightly Review_ in 1875, and the drama itself was reprinted in 1876. The old man found it impossible at first to take his revival seriously, but he woke up at length to take a great interest in the matter, and between 1876 and 1878 he added various scenes, which are in the possession of Mr Buxton Forman, who published one of them in 1895. After leaving Quimper,
WELLS, D. A. — WELLS

Wells went to reside at Marseilles, where he held a professorial chair. He died on the 17th of February 1879.

From R. H. Horne, the author of Orion, the present writer received a letter from the personal appearance of Wells in youth. He was short and stumpy, with dark red hair, a sanguine complexion, and bright blue eyes; he used to call himself "the cub," in reference to the habitual roughness of his manners, which he was able to resolve at will into the most taking sweetness and good-humour. Wells's wife who had been a Miss Emily Jane Hill, died in 1874. Their son, after his father's death, achieved a notoriety which was unpoetical, although recorded in popular song, for he was the once-famous "man who broke the bank at Monte Carlo."

The famous Joseph and his Brethren, concerning which criticism has recovered its self-possession, is an overgrown specimen of the pseudo-Jacobean drama in verse which was popular in ultra-poetical circles between 1820 and 1830. Its merits are those of rich versification, a rather florid and voluble eloquence and a subtle trick of reserve, akin to that displayed by Webster and Cyril Tourneur in moments of impassioned dialogue. Swinburne has said that there are lines in Wells "which might more naturally be mistaken, even by an expert, for the work of the young Shakespeare, than any to be gathered elsewhere in the fields of English poetry." Thus the author of The Heart of Midlothian would have avoided the dulness of subject-matter and the slowness of evolution which impede the reader's progress through this wholly undramatic play. Joseph and his Brethren, in fact, although it has been covered with eulogy by the most illustrious enthusiasts, is less a poem than an odd poetical curiosity.

In 1867 a reprint was published of Joseph and his Brethren, with Swinburne's essay, and reminiscences by T. Watts-Dunton. (E. G.)

WELLS, DAVID AMES (1828-1868), American economist, was born in Springfield, Massachusetts, on the 17th of June 1828. He graduated at Williams College in 1847, was on the editorial staff of the Springfield Republican in 1848, and at that time invented a machine for folding newspapers and book-sheets. He then removed to Cambridge, graduated at the Lawrence Scientific School in 1851, and published in 1859-1863 with George Bliss (1793-1873) an Annual of Scientific Discovery. In 1866 he patented a process for preparing textile fabrics. His essay on the national debt, Our Burden and Our Strength (1864), secured him the appointment in 1865 as chairman of the national revenue commission, which laid the basis of scientific taxation in the United States. In 1866-1870 he was special commissioner of revenue and published important annual reports; during these years he became an advocate of free trade, and he argued that the natural resources of the United States must lead to industrial supremacy without the artificial assistance of a protective tariff which must produce an uneven development industrially. The creation of a Federal Bureau of Statistics in the Department of the Treasury was largely due to Wells's influence. In 1871 he was chairman of the New York State Commission on local taxation which urged the abolition of personal taxes, except of moneyed corporations, and the levy of a tax on the rental value of dwellings to be paid by the occupant; and in 1878 he reported on New York canal tolls. In 1877 he was president of the American Social Science Association. He died in Norwich, Connecticut, on the 5th of November 1888.

He edited many scientific text-books, and wrote The Creed of the Free Trader (1875), Robinson Crusoe's Money (1878), Our Merchant Marine (1852), The Primer of Tariff Reform (1881), Practical Economics (1883), Principles of Taxation (1882), Recent Economic Changes (1889).

WELLS, HERBERT GEORGE (1866-1946), English novelist was born at Bromley, Kent, on the 21st of September 1866, the son of the Rev. George Henry Wells, and professor of classics and Hebrew, who taught at Midhurst grammar school and at the Royal College of Science, where he was trained in physics, chemistry, astronomy, geology and biology. He graduated B.Sc. of London University in 1888 with first-class honours, taught science in a private school, and subsequently did private coaching. In 1893 he began to write for the Pall Mall Gazette, of which he was dramatic critic in 1895. He also wrote for Nature and the Saturday Review. After the success of his fantastic story The Time Machine (1895) he gave his time chiefly to the writing of romances, in which the newest scientific and technical discoveries were used to advance his views on politics and sociology. But he did not confine himself to fiction. His Anticipations (1902) showed his real gift for sociological speculation. Beginning with a chapter on the means of locomotion in the 20th century, it went on to discuss war, the conflict of languages, faith, morals, the elimination of the unfit, and other general topics, with remarkable acuteness and constructive ability. In The Discovery of the Future (1902), Mankind in the Making (1903), A Modern Utopia (1905) and New Worlds for Old (1908) his socialist theories were further developed. As a novelist, meanwhile, he had taken a very high place. Some earlier stories, such as The Wheels of Chance (1896) and Love and Mr Lewisham (1900), had proved his talent for drawing character, and pure fantasies like The War of the Worlds (1898) his abundant invention; but Kipps (1905) and Tono-Bangy (1906) showed a great advance in artistic power. The list of his works of fiction includes The Stolen Bacillus and other Stories (1893), The Wonderful Visit (1895), The Island of Doctor Moreau (1896), The Plattner Story and Others (1897), When the Sleeper Wakes (1899), The First Men in the Moon (1901), The Food of the Gods (1904), In the Days of the Comet (1906), The War of the Worlds (1908), Aune Veronica (1909), The History of Mr. Polly (1910).

WELLS, SIR THOMAS SPENCER, 1st Bart. (1818-1887), English surgeon, was born at St Albans on the 3rd of February 1818, and received his medical education in Leeds, Dublin and St Thomas's Hospital, London, M.R.C.S. (1841). From 1841 to 1848 he served as a surgeon in the navy, and in 1848 he went to Paris to study pathology. In 1853 he settled in London, and took up ophthalmic surgery, interrupting his work to go out to the East in the Crimean War. In 1854 he became surgeon to the Samaritan Free Hospital for Women and Children, London. His reputation in surgery had obtained for him in 1844 the fellowship of the Royal College of Surgeons, and he subsequently became a member of council, Hunterian professor of surgery and pathology (1878), President (1882) and Hunterian Orator (1883).

In 1883 he was made a baronet. His name is best known in connexion with his successful revival of the operation of ovariotomy, which had fallen into disrepute owing to the excessive mortality attending it; and in his skillful hands, assisted by modern surgical methods, the operation lost almost all its danger. His book Diet in Diseases of Infancy and Childhood (1859), Sir Spencer Wells married in 1853 Miss Elizabeth Wright, and had a son and daughters. He died on the 31st of January 1897. His estate at Golder's Hill, Hampstead, was sold after his death to the London County Council and converted into a public park.

WELLS, a city, municipal borough and market town in the Wells parliamentary division of Somerset, England, 20 m. S. of Bristol, on the Great Western and Somerset & Dorset railways. Pop. (1901) 24,440. It is a quiet, old-fashioned place, lying in a hollow under the Mendip Hills, whose spurs rise on all sides like islands. The city is said to have derived its name from some springs called St Andrew's Wells, which during the middle ages were thought to have valuable curative properties. During Saxon times Wells was one of the most important towns of Wessex, and in 905 it was made the seat of a bishopric by King Edward the Elder. About the year 910-912 Bishop John de Villula removed the see to Bath; and for some years Wells ceased to be an episcopal city. After many struggles between the secular clergy of Wells and the regulars of Bath, it was finally arranged in 1180 that the see should be held by the bishop of “bishop and Wells,” and should for the future be elected by delegates appointed partly by the monks of Bath and partly by the canons of Wells. The foundation attached to the cathedral church of Wells consisted of a college of secular canons of St Augustine, governed by a dean, sub-dean, chancellor and other officials. The diocese covers the greater part of Somerset. The importance of the city is almost wholly ecclesiastical; and the theological college is one of the most important in England.
Wells is governed by a mayor, 4 aldermen and 12 councillors. Area 720 acres.
The central part of one of the most magnificent of all the secular churches of England, was executed principally by Bishops Reginald Fitz-Jocelyn (1171-1191), Savaricus (1192-1205) and Jocelyn (1206-1242). According to the usual medieval practice, the eastern part of the church was begun first, and the choir was consecrated for use long before the completion of the nave, the western part of which, with the magnificent series of statues on the façade, is commonly attributed to Bishop Jocelyn. With him was associated a famous architect in Elias de Derham, who was his steward in 1236, and died in 1245. The upper half of the two western towers has never been built. The whole church, 160 ft. high, was built early in the 14th century; the beautiful octagonal chapter-house on the north side, and the lady chapel at the extreme east, were the next important additions in the same century. The whole church is covered with stone groining of various dates, from the Early English of the choir to fan vaulting of the central tower. Its plan consists of a nave (161 ft. in length and 82 in breadth) and aisles, with two short transepts, each with a western aisle and two eastern chapels. The choir and its aisles are of unusual length (153 ft.), and behind the high altar are two smaller transepts, beyond which is the very rich Decorated screen, showing the entire interior of the cathedral. On the north of the choir is the octagonal chapter-house, the vaulting of which springs from a slender central shaft; as the church belonged to secular clergy, it was not necessary to place it in its usual position by the cloister. The cloister, 160 by 150 ft., extends along the whole southern wall of the nave. The extreme length of the church from east to west is 383 ft. The oak stalls and bishop’s throne in the choir are magnificent examples of 15th-century woodwork, still well preserved.

The glory of the church, and that which makes it unique among the many splendid buildings of medieval England, is the wonderful series of sculptured figures which decorate the exterior of the west front. The whole of the façade, 150 ft. wide, including the two western towers, is completely covered with this magnificent series; there are nine tiers of single figures under canopies, over 600 in number, mostly large size, with some as much as 8 ft. in height, and other smaller statues; these represent angels, saints, prophets, kings and queens of the Saxon, Norman and Plantagenet dynasties, and bishops and others who had been benefactors to the see. There are also forty-eight reliefs with subjects from Bible history, and immense representations of the Last Judgment and the Resurrection, the New Jerusalem, and the City of David. The whole of this position is devised so as to present a comprehensive scheme of theological and history, evidently thought out with much care and ingenuity. As works of art, these statues and reliefs are of high merit. Their compositions are of the deepest kind, and are gracefully treated with true sculptural simplicity, and the pose of the figures remarkable for dignity. A great variety of hands and muscles are clearly distinguishable, and no effort is traceable in this mass of sculpture, but in very few cases does the work fail conspicuously below the general level of excellence.

The interior of the central tower presents an interesting example of the skilful way in which the medieval builders could turn an unexpected constructional necessity into a beautiful architectural feature. While it was being built the four piers of the great tower arches showed signs of failure, and, therefore, in order to strengthen them, a second lower arch was built below each main arch of the tower; and on this a third inverted arch was added. Thus the piers received a steady support along their whole height from top to bottom; and yet the opening of each archway was blocked up in the smallest possible degree. So the cases of the two adjacent arches on each side of the tower have a very striking and graceful effect; nothing similar exists elsewhere.

Of great beauty is the cathedral as the bishop’s palace, a moated building, originally built in the form of a quadrangle by Bishop Jocelyn, and surrounded by a lofty circuit wall. The hall and chapel are beautiful structures, mostly of the 14th century. There were originally two halls, one belonging to the principal and twelve vicars; finer remains of this, dating from the 15th century, and other residences of the clergy stand within and near the cathedral close. At least six of these are among the most beautiful examples of medieval domestic architecture. In England.

The church of St Cuthbert is one of the finest of the many fine parochial churches in Somersethire, with a noble tower and spire at the west end, originally cruciform building, but the central tower fell in during the 14th century, and the whole building was much altered during the Perpendicular period. Though much damaged, a very interesting reredos exists behind the high altar; it consists of a " Jesse tree " sculptured in relief, erected in 1470. Another beautiful reredos was discovered in 1848, hidden in the plaster on the east wall of the lady chapel, which is on the north side.

There was a Roman settlement at Wells (Theorodunum, Fonticuli, Tidington, Welwier, Welles), this site being chosen on account of the springs from which the town takes its name, and the Roman road to Cheddar passed through Wells. King Ine founded a religious house there in 704, and it became an episcopal see in 910. To this latter event the subsequent growth of Wells is due. There is evidence that Wells had become a borough owned by the bishops of Wells before 1160, and in that year Bishop Robert granted the first charter, which exempted his burgesses from certain tolls. Other charters granted by Bishop Reginald before 1180 and by Bishop Savaric about 1207 gave the burgesses of Wells the right to jurisdiction in their own disputes. These charters were confirmed by John in 1291, by Edward I. in 1290, by Edward III. with the grant of new privileges in 1334, 1341, 1343 and 1345, by Richard II. in 1377, by Henry IV. in 1399 and by Henry VI. in 1424. Wells obtained charters of incorporation in 1580, 1683, 1688 and 1835. It was represented in parliament from 1205 to 1808. Fairs on March 3, October 14 and November 30 were granted before 1160, and in 1201 fairs on May 9, November 25 and June 25 were added. They were important in the middle ages for the sale of cloth made in the town, but the fairs which are now held on the last Tuesdays in January, May, July, November and December are noted for the sale of cheese. The market days for the sale of cattle and provisions are Wednesdays and Saturdays. Silk-making, stocking-making and gloving replaced the cloth trade in Wells, but have now given place to brush-making, corn and paper milling, which began early in the 19th century.

See Victoria County History, Somerset; Thomas Serel, Lectures on Wells (1880).

WELLS, a city of Jackson county, Ohio, U.S.A., about 30 m. S.E. of Chillicothe. Pop. (1880) 952; (1890) 4277; (1900) 845, of whom 311 were foreign-born; (1910 census) 6875. Land area (1906), 6-62 sq. m. Wells is served by the Baltimore & Ohio South-western, the Hocking Valley, the Cincinnati, Hamilton & Dayton, and the Detroit, Toledo & Ironon railways, and is connected by an electric line with Jackson (pop. in 1910, 5468), the county-seat, about 10 m. S.W. Immediately N. of the city is Lake Almo Park. Wells is situated in a coal and iron mining country; among the city’s manufactures are iron and cement, and in 1905 the value of the factory product was $3,184,295, 41-4% more than in 1900. The municipality owns and operates its water-works and its electric lighting plant. Wells (named in honour of Harvey Wells, its founder) was settled in 1871, and was chartered as a city in 1876.

WELLSVILLE, a city of Columbiana county, Ohio, U.S.A., about 35 m. S. of Youngstown, on the Ohio river. Pop. (1890) 5247; (1900) 6146 (475 being foreign-born and 113 negroes); (1910) 7769. Wellsville is served by the Pennsylvania railway, and by an interurban electric line connecting with Rochester, Pa., and Steubenville, Ohio. It is in a region which has rich deposits of coal, natural gas, oil and clay; and there are various manufactures. The neighbourhood was first settled in 1795 by one James Clark of Washington county, Pennsylvania, who bought a tract of 304 acres here and who transferred it a year afterwards to his son-in-law, William Wells, in whose honour the settlement was named in 1820 when it was platted. From 1832 to 1852 Wellsville was an important shipping point on the Ohio, with daily steamboats to Pittsburgh; it was incorporated as a village in 1845, and was chartered as a city in 1890.

The town of 2,350, two miles north of the Ohio river, is 12 m. S.W. of Linz by rail. Pop. (1900) 12,187. It is situated on the river Traun and possesses an interesting parish church, in Gothic style, rebuilt in the 15th century, but the oldest part supposed to date from the 9th century. The town draws a supply of natural gas, used for lighting, heat and motive power, from deep artesian borings first made in 1881. It has an important trade in corn, timber, horned cattle, pigs and horses, fowls, dairy produce and lumber; and considerable manufactures, including machinery,
cast-iron, copper and brass goods, calico, gunpowder, oil, paper, articles in felt, flour, leather and biscuits. Welsh stands on the site of the Roman Osbala, and was in the 4th century the residence of the dukes of Lambach-Wels. The actual town dates from the 11th century.

**Wels, the name of a famous family of German merchants, members of which held official positions in the city of Augsburg during the 13th century. The family first became important during the 15th century, when the brothers Bartholomew and Lucas Wels carried on an extensive trade with the Levant and elsewhere, and had branches in the principal trading centres of south Germany and Italy, and also in Antwerp, London and Lisbon. The business was continued by Anthony (d. 1578), the son of Lucas Wels, who was one of the first among the Germans to use the sea route to the East, which had been discovered by Vasco da Gama. The Welsers were also interested in mining ventures; and, having amassed great wealth, Anthony’s son Bartholomew (1488–1561) lent large sums of money to Charles V., receiving in return several marks of the imperial favour. Bartholomew and his brother Antony, however, are chiefly known as the promoters of an expedition under Ambrose Dulong (d. 1552), which in 1528 seized the province of Caracas in Venezuela. With the consent of Charles V., this district was governed and exploited by the Welsers, but threatened to become, like the Spanish government, and the undertaking was abandoned in 1555. After Bartholomew’s death the business was carried on by three of his sons and two of his nephews; but the firm became bankrupt in 1614. Bartholomew’s niece Philippine (1537–1580), the daughter of his brother Francis (1497–1572), married the Archduke Ferdinand, son of the emperor Ferdinand I.

Perhaps the most famous member of the Wels family was Antony’s grandson, Marcus (1528–1614). Educated in Italy, Marcus became burgomaster of Augsburg, but was more distinguished for his scholarship and his writings. The most important of his many works is his *Rerum Bellicarum Libri quinque*, dealing with the early history of the Bavarians, which was translated into German by the author’s brother Paul (d. 1620). His works, Marcus Welsers opera historica et philologica, were collected and published with a biography of Marcus by C. Arnold (Nuremberg, 1683). The Augsburg branch of Welsers became extinct in 1797, and a branch which settled at Nuremberg in 1878; but the Uml branch of the family is still flourishing.

**Welsh, or Leges Walliae.** There is, comparatively speaking, no great distance of time between the *leges barbarorum* and the Laws of Wales, when those branches of the latter show y similarity, may almost be the same idea of law as the former; and, apart from the fact that Wales became permanently connected at the end of the 12th century with a Teutonic people, the English, it has been noticed that in Wales Roman and Germanic, but no traces of a specific Welsh, law are found. King Howel Dda (i.e. the Good), who died in 950, is the originator of the Welsh code.1 In the preface it is stated that Howel, seeing the laws and customs of the violated with impunity, summoned the archbishop of Menevia, other bishops and the chief of the clergy, the nobles of Wales, and six persons (four laymen and two clerks) from each comity, to meet at a place called Y Ty Gwyn ar Dav, or the white house on the river Tav, repaired thither in person, selected from the whole assembly twelve of the most experienced persons, added to their number a clerk or doctor of laws, named Blgwyr, and to these thirteen confided the task of examining, retaining, expounding and abrogating. Their compilation was, when completed, read to the assembly, and, after having been confirmed, proclaimed. Howel caused three copies to be written, one of which was to accompany the court for daily use, another was deposited in the court at Aberfraw, and a third at Dinewr. The bishops denounced sentence of excommunication against all transgressors, and soon after Howel himself went to Rome attended by the archbishop of St David’s, the bishops of Bangor and St Asaph and thirteen other personages. The laws were recited before the pope and confirmed by his authority, upon which Howel and his companions returned home.2 All this could not have been effected before Howel had subjected Wales to his own rule, therefore not before 943. We have three different recensions of the laws, one for North Wales, another for Dyfed, or Dyfed and South Wales, a third for Gwent or North-east Wales. We do not know how far these recensions were uniform in the beginning; but a variance must have occurred shortly after, for the manuscripts in which the codes are preserved differ greatly from each other. The code was originally compiled in Welsh, but we have no older MSS. than the 12th century, and even the earliest ones (especially those of the Venedocta recension) contain many interpellations. The Latin translations of the code would seem to be very old, though even here we have no earlier MSS. (belonging to the 11th century). The Latin text is much shorter than the Welsh, but we do not know whether this abridgment was made on purpose, or whether the translation is an imitation of an earlier text. The texts present only a few traces of Roman law, which, however, are evidently additions of a later period.

1 There is no historical foundation for the legendary laws of a prince Dyrmal (or Dyrnwal) Moel Mud, nor for the Laws of Marsia, which are said to belong to a period before the Roman invasion, even so early as 400 years before Christ. An English translation by the side of the Welsh text of the so-called trials of Dywnwal Moel Mud is given by Owen, in The Ancient Laws of Wales.

2 The whole body of Welsh laws was published in one volume by Aneurin Owen under the direction of the commissioners of the public records as *Ancient Laws and Institutes of Wales* (London, 1841). The text of Howell’s laws has been edited by A. W. Wade-Evans as *Welsh Medieval Law* (London, 1906).

**WELSHPOOL (or Welshpool, so called because Pool, its old name, is used in its modern form as the name of a kind of Welsh wool).** Welshpool, or W. as it is generally written, is a market town and municipal and contributory parliamentary borough of Montgomeryshire, N. Wales, in the upper Severn valley, on the Montgomeryshire canal and the Cambrian railway, 8 m. N. of Montgomery, and 182 m. from London. Pop. (1901) 6121. Its buildings and institutions include the old Gothic church of St Mary, the Powysland Museum, with local fossils and antiquities, and a library, vested (with its science and art school) in the corporation in 1887. Powis Castle (about a mile S.W. of the town) is the seat of Earl Powis, who has a large collection of local and miscellaneous curiosities. The flannel manufacture has been transferred to Newtown, but Welshpool has tweeds and woollen shawls, besides a fair trade in agricultural produce, malting and tanning. The town returned a member to parliament from 1556 to 1728, was again enfranchised in 1832, and now (with Llanfyllin, Llanidloes, Montgomery, Machynlleth and Newtown) forms the Montgomery district of parliamentary boroughs. A charter was granted to the town by the lords of Powis, confirmed by James I. (1615), and enlarged by Charles II. The castle was begun, in or about 1100, by Cadigan ab Bleddy ab Gydyw (Cynmy), and finished by Gwenwynwyn; in 1196 it was besieged, undermined and taken by Hubert, archbishop of Canterbury. Retaken by Gwenwynwyn in 1197, it was dismantled by Llewelyn, prince of N. Wales, in 1253. It then remained for several years in the hands of the lords of Powis. During the Civil War, then lord Powis, a royalist, was imprisoned, and the castle was later demolished. Powis Castle, being of red sandstone, is usually called in Welsh Castell Coch (red castle). In the park is Llanfyllin (black pool), whilst Welshpool is said to be named from the market or market division of Shropshire, England, 11 m. N. of Shrewsbury on the London & North Western railway. Pop. (1901) 3706. It is a pleasantly situated town with a considerable agricultural trade. The church of St Peter and St Paul retains a Norman tower. Flour-milling and tanning are the chief industries. In the neighbourhood is the splendid domain of Hawkstone.

In the reign of Edward the Confessor Wem was held as four manors, but at the time of the Domesday Survey William
Pantuli was holding the whole as one manor of Roger, earl of Shrewsbury, from whom it passed to the Boteler, barons of Wem. The famous Judge Jeffreys was among the subsequent lords of the manor and was treated by the beakers of Wem in 1620 with the lands of his own son and heir in 1720 the title became extinct. The town was a borough by prescription, but there appears to be no mention of burgesses before the 15th century. In 1495 Ralph, Lord Greystock, is said to have granted a charter, no longer extant, to his tenants in the manor, and in 1674 the freeholders, “bourgeois holders” and copyholders, of Wem brought an action against Daniel Wichlery, then lord of the manor, for the establishment of customs and privileges chiefly connected with the tenure of their lands and tenements, which was decided in their favour. The borough was extinguished in 1874, but the two bailiffs, both elected as the town’s last lord of the manor, one by his steward, the other by a borough jury, but in the beginning of the 16th century there were only seventy-two burgesses and their rights seem to have gradually disappeared. An urban district council was formed in 1900. Wem has never been represented in parliament. The market was originally held on Sunday under grant from John to Warin Fitz Gerald in 1205, but in 1351, in consequence of a protest from the archbishop of Canterbury, it was changed to Thursday, on which day it is still held. The grant of 1205 also included a fair at the feast of St Peter and Paul, which was maintained until 1606. In the following year, when fairs were also held at the feast of St Mark, chiefly for linen cloth, under grant from Charles I, to Thomas Howard in 1636, and at the feast of St Martin, bishop of Tours, for the sale of hops. A great fire which broke out at Wem on the 3rd of March 1677 caused damage to the extent of £2,577.

See Victoria County History, Shropshire; Samuel Garbet, The History of Wem (1818).

WEMBLEY, an urban district in the Harrow parliamentary division of Middlesex, England, 10 m. N.W. of St Paul’s Cathedral, and 10 m. by London & North Western railways. Pop. (1901) 4519. Wembley adjoins Sudbury on the east; the district is residential, but lacks natural attractions except in the case of Wembley Park, a pleasant wooded recreation ground, owned by a company. Here a tower was begun on the site of the Eiffel Tower in Paris, and projected to exceed it in height, reaching 1300 ft., but only a short stage was completed. The manor of Wembley belonged to the priory of Kilburn until that foundation was dissolved by Henry VIII.

WEMYSS, EARLS OF, the title held by a Scottish family who had a long and distinguished history, and who were connected with the history of Scotland during the whole of the 17th century, and of which various members had attained distinction. In 1628 Sir John Wemyss, who had been created a baronet in 1629, was raised to the peerage as Baron Wemyss of Elcho; and in 1633 he became earl of Wemyss, and Baron Elcho and Methel, in the peerage of Scotland. He took part with the Scottish parliament against Charles I, and died in 1649. On the death of David, 2nd earl of Wemyss (1610-1679), the estates and titles passed to his daughter Margaret, countess of Wemyss, whose son David, 3rd earl of Wemyss, succeeded on her death in 1705. His son James, 4th earl (1689-1756), married a great heiress, Jane, daughter of Lord Digby, and made a large fortune by gambling. His son David, Lord Elcho (1721-1787), was implicated in the Jacobite rising of 1745, and was consequently attainted, the estates passing to his younger brother James, while the title remained dormant after his father’s death, though it was assumed by Elcho’s brother Francis, who took the name of Charteris on inheriting his maternal grandfather’s estate. A reversal of the attainder was granted in 1756 to his descendant Francis Charteris Wemyss Douglas (1772-1853), who had been created Baron Wemyss of Wemyss in the peerage of the United Kingdom in 1821, and had assumed the name of Charteris Wemyss Douglas on inheriting some of the Douglas estates through a female ancestor. Thenceforward the title descended in the direct line.

WEMYSS, a parish of Fifeshire, Scotland, embracing the villages of East and West Wemyss and the police burgh of Buckhaven, a fishing port lying on the northern shore of the Firth of Forth, 23 m. S.W. of Leven, on the North British Railway Company’s branch line from Thornton Junction to Methil. Coal mining is the principal industry of the district, the coal being exported from the port of Methil, of which the harbour was constructed by David, 2nd earl of Wemyss (d. 1679), the town being made a burgh of barony in 1662. Population of Buckhaven, including Methil and Innerleven (1901), 8828; of East Wemyss, 2522; of West Wemyss, 1253; of Wemyss parish, 15,631. The district is of much archaeological and historic interest. On the shore to the north-east are two square towers which are supposed to have formed part of Macduff’s castle; and near them are the remarkable caves (weems, from the Gaelic, 3amaim) from which the district derives its name. Several of the great Roman arch-sculptures, believed some to be the work of the Christian missionaries who found shelter here; by others ascribed to the same prehistoric agency as the inscribed stones of northern Scotland. Near East Wemyss is Wemyss Castle, the ancient seat of the family of the same name which has played a conspicuous part in Scottish history. It was at Wemyss castle that Mary, queen of Scots, first met the earl of Darnley, in 1565, and her room is still known as “the Presence Chamber.”

WENCELESLAUS (1361-1419), German king, and, as Wenceslaus IV, King of Bohemia, was the son of the emperor Charles IV, and Anna, daughter of Henry II, duke of Schweidnitz. Born at Nuremberg on the 26th of February 1361, he was crowned king of Bohemia in June 1363, and invested with the margravate of Brandenburg in 1373. In September 1370 he married Joanna (d. 1386) daughter of Albert I, duke of Bavaria, and was elected king of the Romans or German king at Frankfort on the 10th of June 1376, and crowned at Aix-la-Chapelle on the 6th of July following. He took some part in the government of the empire during his father’s lifetime, and when Charles died in November 1378 became sole ruler of Germany and Bohemia, but handed over Brandenburg to his half-brother Sigismund, his choice was a period of confusion both in church and state, and although he appears to have begun to rule with excellent intentions, he was totally unfit to cope with the forces of disorder. Germany was torn with feuds, the various orders for the establishment of peace were disregarded, and after 1380 the king paid very little attention to German affairs. In 1383 he inherited the duchy of Luxembourg from his uncle Wenceslaus and in 1387 assisted his half-brother Sigismund to obtain the Hungarian throne.

For some time Wenceslaus ruled Bohemia successfully, but he fell out of favour with the Bohemians and was deposed in 1397. He resisted the crown of Hungary but was defeated and put to death at Varna in 1396. The Bohemians were so now in 1397 and 1398, and Wenceslaus II was out of power for a year. He then assumed the government of his country with great energy and success, and was crowned on the 13th of June 1398 in Prague. He was evidently a man of great talents and a most able administrator, and his government was marked by a spirit of independence and energy. His foreign policy was directed towards the maintenance of peace, and he was fortunate in having the support of the emperor Sigismund. In 1400 he returned to Hungary, and Wenceslaus regained his
freedom and with it his authority in Bohemia; and after the death of the German king Rupert in 1410 appears to have entertained hopes of recovering his former throne. Abandoning this idea, however, he voted for the election of Sigismund in 1411, but stipulated that he should retain the title of king of the Romans. His concluding years were disturbed by the troubles which arose in Bohemia over the death of John Huss, and which the vacillating king did nothing to check until compelled by Sigismund. In the midst of these disturbances he died at Prague on the 16th of August 1419. His second wife was Sophia, daughter of John, duke of Bavaria-Munich, but he left no children. Wenceslaus was a capable and educated man, but was lacking in perseverance and industry. He neglected business for pleasure and was much addicted to drunkenness. He favoured the teaching of Huss, probably on political grounds, but exercised very little influence during the Hussite struggle.

See Th. Lindner, Geschichte des deutschen Reiches vom Ende des 14ten Jahrhunderts bis zur Reformation, part i. (Brunswick, 1875-1886), and "Die Wahl Wenzels," in der Forschungen zur deutschen Geschichte, Band iv. (Göttingen, 1862-1886); F. M. Pelzel, Lebensgeschichte des römischen und böhmischen Königs Wenceslaus (Prague, 1786-1790); F. Palacky, Geschichte von Böhmen (Bände iii. and iv.) (Prague, 1871). E. Th. Kreyenschultze und W. Kretschmer, Geschichte der Kurfürsten (Rostock, 1887). The article by Th. Lindner in the Allgemeine deutsche Biographie, Band xi., should also be consulted for a good account of his life and works.

WEN-CHOW-FU, a prefectural city in the province of Chekiang, China, and one of the five ports opened by the Chifu convention to foreign trade, situated (28° 1' N., 120° 31' E.) on the south bank of the river Gou, about 20 m. from the sea. The population is estimated at 80,000. The site is said to have been chosen by Kwo P'oh (A.D. 275-324), a celebrated antiquary who recognized in the adjacent mountain peaks a correspondence with the stars in the constellation of the Great Bear, from which circumstance the city was first known as the Tow or Great Bear city. Subsequently the appearance in its vicinity of a white deer carrying a flower in its mouth was deemed so favourable an omen as to more than justify the change of its name to Luh or Deer city. Its present name, which signifies the "mild district," and is correctly descriptive of the climate, though not of the inhabitants, was given to it during the Ming dynasty (1368-1644). The walls, which were built in the 10th century, are about 4 m. in circumference, 35 ft. in height, and 12 ft. broad at the top. The streets are paved with brick and are wide, straight and clean. The gates, seven in number, were erected in 1508. The width of the city Wén-chow is about 1560 m. S.S.E. by road from Peking and 660 m. E.S.E. of Hankow. The British consul and the customs outdoor staff occupy foreign-built houses on Conquest Island, which lies abreast of the city. The neighbourhood is hilly and pretty, while opposite the north-west gate Conquest Island forms a picturesque object. The island is, moreover, more beautiful than healthy. The port, which was opened to foreign trade in 1876, has not justified the expectations which were formed of it as a commercial centre, and in 1908 the direct foreign trade was valued at £10,000 only.

There is no foreign settlement at Wén-chow, and the foreign residents are mainly officials and missionaries. The tea trade of Wén-chow-Fu, formerly important, has declined owing to careless cultivation. A considerable native export trade in wood, charcoal, bamboo, medicines, paper umbrellas, oranges, otter skins and tobacco leaf is carried on. The imports are chiefly cotton yarn and piece goods, kerosene oil, palm-leaf fans, ailinette dyestuffs, and matches.

WENDEN (Lettish: Vendi), a town of western Russia, in the gubernia of Pskow, 160 m. by rail N.E. of Riga. Pop. (1827) 6,327. Here are the well preserved ruins of a former castle of the Brethren of the Sword, afterwards (from 1257) of the grand-master of the Teutonic Knights. In 1577 the garrison blew it up to prevent it from falling into the hands of Ivan the Terrible of Russia. It was rebuilt, but has been in ruins since a fire in 1748.

WENDOVER, a market town in the Aylesbury parliamentary division of Buckinghamshire, England, 33 m. N.W. of London by the Metropolitan and the Great Central joint railway. Pop. (1901) 2,926. It is picturesquely situated in a shallow defile of the Chiltern Hills, towards their western face. Wendover is a quiet town of no great activity. Its church of St Mary is mainly Decorated, and a few old houses remain.

Wendover (Wendore, Wendoore, Wendour) is on the Upper Ockfield Way, which was probably an ancient British road, and various traces of a British settlement have been found in the town and neighbourhood. In 1087 the king held the manor of Wendover, and therefore it belonged to the ancient demesne of the crown. There is no trace of any incorporation of the town. Two burgesses were summoned to the parliaments of 1300, 1307 and 1309, but no further returns were made until 1625. In 1632 Wendover lost its right of separate representation. It is noteworthy that John Hampden and Edmund Burke both represented the borough. In 1646 Edward IV. confirmed to his tenants and the residents within the borough that they had always held every Thursday. For a short period the day was changed to Tuesday, but the market was given up before 1888. Hugh de Gurnay held a fair in Wendover on the eve, feast and morrow of St John the Baptist, granted him in 1214. Another fair was granted to John de Molyns in 1347-1348 on the eve, feast and morrow of St Barnabas, but in 1646 Edward IV. confirmed to the town the right of holding fairs. In 1889 the town was incorporated.

WENDT, HANS HINRICH (1853-1907), German Protestant theologian, was born in Hamburg on the 18th of June 1853. After studying theology at Leipzig, Göttingen and Tübingen, he became in 1885 professor ordinarius of systematic theology at Heidelberg, and in 1893 was called to Jena. His work on the teaching of Jesus (Die Lehre Jesu, 1886-1890; Eng. trans. of second part, 1892) made him widely known. He also edited several editions (5th to 6th, 1880-1893) of the Commentary on the Acts of the Apostles in H. A. W. Meyer's series. In 1904 he delivered two addresses in London on "The Conscience of Sweden and the Christian Element in Revelation, and Typical Forms of Christianity," as the Essex Hall Lectures (published, 1904).

His works include: Die christliche Lehre von der menschlichen Vollkommenheit (1882), Der Erfahrungsweg für die Wahrheit des Christentums (1897), and Das Johannesevangelium (1900; Eng. trans., 1902).

WENLOCK, a municipal borough in the Ludlow and Wellington parliamentary divisions of Shropshire, England, extending on both sides of the river Severn. Pop. (1901) 15,866. It includes the market towns of Broseley, Madeley and Much Wenlock (q.v.). The parish of Madeley includes the small towns of Ironbridge and Coalport, with part of Coalbrookdale (q.v.). The district is in part agricultural, but contains limestone quarries, some coal-mines and iron-works. The borough is under a mayor, 8 aldermen and 24 councillors. Area, 22,657 acres.

Wenlock (Wenloche) is said to be of pre-Roman origin, but owed its early importance to the nunnery founded c. 680 by St Milburg, daughter of Merewald, king of Mercia. This was destroyed by the Danes but refounded as a priory by Earl Roger de Montgomery in 1077. It was abandoned by the Conqueror until Roger de Montgomery founded a house of the Clinker order on its site. The town was a borough by prescription, and its privileges began with the grants made to the priory and its tenants. It was incorporated under the name of "Baliff, Burgesses and Commonality" by Edward IV. in 1468 at the request of Sir John Wenlock, Kt., and "in consideration of the laudable services which the men of the town performed in assisting the king to gain possession of the crown," and the charter was confirmed in
1547 by Henry VIII. and in 1631 by Charles I. The bailiff was to be chosen annually by the burgesses, but his election seems to have depended entirely upon the lord of the manor, and, after a contest in 1821 between Lord Forester and Sir W. W. Wyone, the lord of the manor at that date, who was nominated by each of them. In the report of 1853 the borough is said to consist of seventeen parishes and to be unfit for corporate government. By the charter of Edward IV. the town obtained the right of sending two members to parliament, but was disfranchised in 1885. The first grant of a market and fair is dated 1227, when the prior of Wenlock obtained licence to hold a fair on the vigil, day and morrow of the Nativity of St John the Baptist, and a market every Monday. The incorporation charter of 1468 granted these to the burgesses, who continue to hold them.

\[\text{(This text is not clearly legible and is omitted.)}\]

\[\text{WENLOCK GROUP—WENSLEYDALE, BARON (1782–1880), English judge, was born near Lincolnshire on the 22nd of March 1782. He was educated at Macclesfield grammar school and Trinity College, Cambridge. He had a brilliant career at the university, winning the Craven scholarship, Sir William Browne’s gold medal, and being fifth wrangler and senior chancellor’s medallist in classics. Called to the bar at the Inner Temple he rapidly acquired an excellent common law practice and in 1828 was raised to the king’s bench, while still of the junior bar. In 1834 he was transferred from the king’s bench to the court of exchequer, where for one of the twenty years he exercised considerable influence. The changes introduced by the Common Law Procedure Acts of 1854, 1855 proved too much for his legal conservatism and he resigned in December of the latter year. The government, anxious to have his services as a law lord in the House of Lords, proposed to confer on him a life peerage, but this...}\]
was opposed by the House of Lords (see Peerage), and he was eventually created a peer with the usual remainder (1896). He died at his residence, Amphilth Park, Bedfordshire, on the 27th of February 1895, and having outlived his three sons, the title became extinct.

WENSLYDALE, the name given to the upper part of the valley of the river Ure in the North Riding, Yorkshire, England. It is celebrated equally for its picturesque scenery and for the numerous points of historical and other interest within it. The Ure rises near the border of Yorkshire and Westmorland, in the uplands of the Pennine Chain. Its course is generally easterly as it is confined by uplands, but on descending upon the central plain of Yorkshire it takes a landmark course, passing through Ripon and Boroughbridge to form, by its union with the Swale, the river Ouse, which drains to the Humber. The name Wensleydale is derived from the village of Wensley, some 25 m. from the source of the river, and is primarily applied to a section of the valley extending 10 m. upstream from that point, but is generally taken to embrace the whole valley from its source to a point near Jervaulx abbey, a distance of nearly 40 m., below which the valley widens out upon the plain. The dale is traversed by a branch of the North-Eastern railway from Northallerton.

As seen from Hawes, the dale presents a series of landscapes in which the broken limestone craggs of the valley-walls and the high-lying moors beyond them contrast finely with the rich land at the foot of the hills. Beyond Hawes, towards the source, the valley soon becomes wide, bare and shallow, less rich in contrast, but wilder. On both sides throughout the dale numerous narrow tributary vales open out. Small waterfalls are numerous. The chief are Aysgarth Force, on the main stream, Mill Gill Force on a tributary near Askrigg, and Hardraw Scar beyond Hawes, the finest of all, which shoots forth over a projecting parapet of limestone so as to leave a clear passage behind it. The surrounding cliffs complete a fine picture. The small river Bain, joining the Ure near Askrigg, forms a pretty lake called Semer or Semmer Water, 3 m. in length.

Following the valley upward, the points of chief interest apart from the scenery are these. JERVAULX ABBEY was founded in 1156 by Cistercians from Byland, who had previously settled near Askrigg. The remains are mainly transitional Norman and Early English, and are not extensive. Of the great church hardly any fragments rise above ground-level, but the chapter-house, reECTORY and cloisters remain in an excellent state. In a beautiful ivy-clad woodland. Above the small town of Middleham, where there are large training stables, rises the Norman keep of Robert Fitz-Ranulph, which passed to the Nevills, being held by the "King-maker," Warwick. The subsidiary buildings date down to the 14th century. In Cover Dale near Middleham is the ruined Premonstratensian abbey of Coverham, founded here in the 13th century and retaining a gatehouse and part of a walled cloister. Farther up Wensleydale Bolton Castle stands high on the north side. This was the stronghold of the Scroopes, founded by Richard I's chancellor of that name. Its walls, four corner-towers and fine position still give it an appearance of great strength.

WENTWORTH, the name of an English family distinguished in the parliamentary history of the 16th and 17th centuries. The Wentworths traced descent from William Wentworth (d. 1308) of Wentworth Woodhouse, in Yorkshire, who was the ancestor of no fewer than eight distinct lines of the family, two main branches of which were settled in the 14th century at Wentworth Woodhouse and North Elmshill respectively. From the elder, or Wentworth Woodhouse branch, were descended Thomas Wentworth the celebrated earl of Strafford (q.e.), and through him the Watson-Wentworths, marquess of Rockingham in the 18th century; and the earls FitzWilliam of the fascinating branches who settled in Derbyshire. To the younger branch of John Wentworth (d. 1452), great-grandson of the above-mentioned William, Roger, who was a son of John Wentworth (fl. 1413) of North Elmshill, Yorkshire, acquired the manor of Nettlestead in Suffolk in right of his wife, a grand-daughter of Robert, Baron Tibetol, in whose lands this manor had been included, and who died leaving an only daughter in 1372. Roger's son Henry (d. 1482) was twice married; by his first wife he was the ancestor of the Wentworths of Gosfield, Essex; by his second of the Wentworths of Lillingstone Lovell, Buckinghamshire.1 Another of Roger Wentworth's sons, Sir Philip Wentworth, was the grandson of Margery, wife of John Seymour, mother of the Protector Somerset and of Henry VIII's wife Jane Seymour, and grandmother of King Edward VI. Margery's brother Sir Robert Wentworth (d. 1528) married a daughter of Sir James Tyrrell, the reputed murderer of Edward V. and his brother in the Tower; and Sir Robert's son by this marriage, Thomas Wentworth (1501—1551), was summoned to parliament by writ in 1539 as Baron Wentworth of Nettlestead. He was one of the peers who signed the letter to the pope in favour of Henry VIII's divorce from Catherine of Aragon, and in 1541 was created Baron and Earl of Surrey. He died in 1551 and left no issue.

THOMAS WENTWORTH, 2nd Baron Wentworth of Nettlestead (1525—1584), was the eldest son of the above-mentioned 1st Baron. He served with distinction under his relative the Protector Somerset at the battle of Pinkie in 1547; but in 1551 he was one of the peers who condemned Somerset to death on a charge of felony. He was a trusted counsellor of Queen Mary, who appointed him deput of Calais. Wentworth was the last Englishman to hold this post, for, on the 7th of January 1558, he was beheaded at Tyburn. His son by his second marriage was the last representative as to the defensive condition of the fortress having been disregarded by the English Council some years earlier. Wentworth himself remained in France as a prisoner of war for more than a year, and on his return to England in 1559 he was sent to the Tower for having surrendered Calais; but he was acquitted of treason. He died on the 11th of January 1584. His eldest son William married a daughter of Lord Burghley, but predeceased his father, whose peerage consequently passed to his second son Henry (1556—1593), who was one of the judges of Mary, queen of Scots, at Fotheringhay in 1587. This Henry was the 3rd Baron Wentworth of Nettlestead (1617—1667), who was the eldest son of Henry, whom he succeeded as 4th Baron Wentworth of Nettlestead in 1593. In 1614 he inherited from an aunt the estate of Toddington in Bedfordshire, till then the property of the Cheyney family, and here he made his principal residence. In 1626 he was created earl of Cleveland, and in the following year he served under Buckingham in the expedition to La Rochelle. Adhering to the king's cause in the parliamentary troubles, he attended his kinsman Strafford at his execution, and afterwards was a general on the royalist side in the Civil War. The earl of Cleveland was taken prisoner at the battle of Newbury. Cleveland commanded a cavalry regiment at Worcester in 1651, when he was again taken prisoner, and he remained in the Tower till 1656. He died on the 25th of March 1667. His early extravagance and the fortunes of war had greatly reduced his estates, and Nettlestead was sold in 1643. Cleveland was described by Clarendon as "a man of signal courage and an excellent officer"; his cavalry charge at Cropredy Bridge was one of the most brilliant incidents in the Civil War, and it was by his bravery and presence of mind that Charles II. was enabled to escape from Worcester. At his death the earldom of Cleveland became extinct. He outlived his son Thomas (1613—1645), who was called up to the House of Lords in his father's lifetime as Baron Wentworth, and whose daughter Henrietta Maria became Baroness Wentworth in her own right on her grandmother's death. This lady, who was the duke of Monmouth's mistress, died unmarried in 1686. The barony of Wentworth then reverted to Cleveland's daughter Anne, who married the 2nd Lord Lovelace, from whom it passed to her grand-daughter Martha (d. 1745), wife of Sir John Byron, who married the 3rd Lord Lovelace, and from whom it descends to a descendant of Anne's daughter Margaret. Edward Noel, who was created Viscount Wentworth of Wellesborough in 1762, the viscounty came extinct at his death, and the barony again passed through the female line in the person of Noel's daughter Judith to the latter's daughter Anne Isabella, who married Lord Byron the 1st in 1817.

1 In the 16th century Lillingstone Lovell was in Oxfordshire, that portion of the county being surrounded by Buckinghamshire, with which it was afterwards incorporated.
WENTWORTH, W. C.—WENZEL

poet; and from her to Byron's daughter Augusta Ada, whose husband was in 1838 created earl of Lovelace. The barony of Wentworth was thereafter held by the descendants of this nobleman in conjunction with the earldom of Lovelace.

Paul Wentworth (1533–1593), a prominent member of parliament in the reign of Elizabeth, was a member of the Lillingstone Lovell branch of the family (see above). His father Sir Nicholas Wentworth (d. 1577) was one of the members of Parliament for Peter's house, and he first came into notice by the freedom with which in 1566 he criticized Elizabeth's prohibition of discussion in parliament on the question of her successor. Paul, who was probably the author of the famous puritan devotional book The Miscellany, or Regestri and Methodical Historie of Orisons (London, 1613), died in 1593. He became possessed of Burnham Abbey through his wife, to whose first husband, William Tyldesley, it had been granted at the dissolution of the monasteries by Henry VIII.

Peter Wentworth (1590–1656) was the elder brother of the above-mentioned Paul, and like his brother was a prominent puritan leader in parliament, which he first entered as member for Barnstaple in 1571. He took a firm attitude in support of the liberties of parliament against encroachments of the royal prerogative, on which subject he delivered a memorable speech on the 8th of February 1576, for which after examination by the Star Chamber he was committed to the Tower. In February 1587 Sir Anthony Cope (1548–1614) presented to the Speaker a bill abrogating the existing ecclesiastical law, together with a puritan revision of the Prayer Book, and Wentworth supported him by bringing forward certain articles touching the liberties of the House of Commons; Cope and Wentworth were both committed to the Tower for interference with the queen's ecclesiastical prerogative. In 1593 Wentworth again suffered imprisonment for presenting a petition on the subject of the succession to the Crown; and it is probable that he did not regain his freedom, for he died in the Tower on the 10th of November 1596. While in the Tower he wrote A Pithie Exhortation to her Majesty for establishing her Successor to the Crown, a famous treatise preserved in the British Museum. Peter Wentworth was twice married, to a first wife, by whom he had no children, was a cousin of Catherine Parr, and to his second a sister of Sir Francis Walsingham, Elizabeth's secretary of state. His third son, Thomas Wentworth (c. 1568–1623), was an ardent and sometimes a violent opponent of royal prerogative in parliament, of which he became a member in 1604, continuing to represent the city of Oxford from that year until his death. He was called to the bar in 1604 and became recorder of Oxford in 1607. Another son, Walter Wentworth, was also a member of parliament.

Sir Peter Wentworth (1592–1675) was a grandson of Peter Wentworth, being the son of Peter's eldest son Nicholas, from whom he inherited the manor of Lillingstone Lovell. As sheriff of Oxfordshire in 1634 he was charged with the duty of collecting the levy of ship-money, in which he encountered popular opposition. He was member for Tamworth in the Long Parliament, but refused to act as a commissioner for the trial of Charles I. He was a member of the council of state during the Commonwealth; but was denounced for immorality by Cromwell in April 1653, and his speech in reply was interrupted by Cromwell's forcible expulsion of the Commons. Sir Peter, who was a friend of Milton, died at Oxford on 12th of December 1675, having never been married. By his will he left a legacy to Milton, and considerable estates to his grand-nephew Fisher Dike, who took the name of Wentworth; and this name was borne by his descendants until dropped in the 18th century by Wentworth Dike Wentworth, great-grandfather of Sir Charles Wentworth Dike (q.v.).

WENTWORTH, WILLIAM CHARLES (1793–1872), the "Australian patriot," who claimed descent from the great Stratford, but apparently without sufficient reason, was born in 1793 in Norfolk Island, the penal settlement of New South Wales, where his father D'Arcy Wentworth, an Irish gentleman of Roscommon family, who had emigrated in 1700 and later became a prominent official, was then government surgeon. The son was educated in England, but he spent the interval between his schoolings at Greenwich and his matriculation (1816) at Peterhouse, Cambridge, in Australia, and early attracted the attention of Governor Macquarie by some adventurous exploration in the Blue Mountains. In 1816 he published in London a work on Australasia in two volumes, and in 1823 he only just missed the chancellor's medal at Cambridge (won by W. M. Praed) with a stirring poem on the same subject. Having been called to the bar, he returned to Sydney, and soon obtained a fine practice. With a fellow barrister, Wardell, he started a newspaper, the Australian, in 1824, to advocate the cause of self-government and to champion the "emancipists"—the former convicts, now freed andProgress against the "exclusiveists"—the officials and the more aristocratic settlers. With Wardell, Dr. William Bland and others, he formed the "Patriotic Association," and carried on a determined agitation both in Australia and in England, where they found able supporters. The earlier object of their attack was the governor, Sir Ralph Darling, who was recalled in 1831 in consequence, though he was acquitted by a select committee of the House of Commons of the charges brought against him by Wentworth in connexion with his severe punishment of two soldiers, Sudds and Thompson, who had perpetrated a robbery in order to obtain their discharge (a favourite dodge at the time), and one of whom, Sudds, had died. Wentworth continued, under the succeeding governor, Sir Richard Bourke, who was guided by him, and Sir George Gipps, with whom he had constant differences, to exercise a powerful influence; and in 1842, when the Constitution Act was passed, it was generally recognized as mainly his work. He became a member of the first legislative council and led the "squatter party." He was the founder of the university of Sydney (1852), where his son afterwards founded a career in his honour, and he took part in the promotion of the new constitution for the colony (1854), subsequently (1861) becoming president of the new legislative council. But things had meanwhile moved fast in the colony, and Wentworth's old supremacy had waned, since Robert Lowe (afterwards Lord Sherbrooke) and others had come into prominence in the political arena. He had done his work for colonial autonomy, and was becoming an old man, somewhat out of touch with the new generation. For some years before 1861 he stayed chiefly in England, where in 1857 he founded the "General Association for the Australian Colonies," with the object of obtaining from the government, a federal constitution under which the two colonies and in 1862 he definitely settled in England, dying on the 20th of March 1872. His body was taken to Sydney and accorded a public funeral by the unanimous vote of the New South Wales legislature.

WENZEL, KARL FRIEDRICH (1740–1793), German metalurgist, was born at Dresden in 1740. Disliking his father's trade of bookbinding, for which he was intended, he left home in 1755, and after taking lessons in surgery and chemistry at Amsterdam, became a ship's surgeon in the Dutch service. In 1760, tired of sea-life, he went to study chemistry at Leipzig, and afterwards devoted himself to metallurgy and assaying at his native place with such success that in 1786 he was appointed...
chemist to the Freiberg foundries by the elector of Saxony. In 1785 he became assessor to the superintending board of the foundries, and in 1786 chemist to the porcelain works at Meissen. He died at Freiberg on the 26th of February 1793.

In consequence of the quantitative analyses he performed of a large number of salts, he has been credited with the discovery of the law of neutralization (Vordrüssungen über die chemische Verschiedenheit der Körper, 1777). But this attribution rests on a mistake first made by J. B. Berzelius and copied by subsequent writers, and Werner's published work (as pointed out by G. H. Hess in 1840) does not warrant the conclusion that he realized the existence of any law of invariable and reciprocal proportions in the combinations of acids and bases.

WEPENER, a town of the Orange Free State, 82 m. by rail S.E. of Bloemfontein, and 2 m. W. of the Basuto border. Pop. (1904) 1366, of whom 822 were whites. It lies in a rich grain district, and 3 m. north by the Caledon river are large flour mills. The town, named after the leader of the Boers in their war with the Basuto chief Mosheph in 1865, was founded in 1886. In April 1900 it was successfully defended against the Boers under Christiana de Wet by a Cape force of Irregulars commanded by Colonel E. H. Dalgety.

WERDAU, a town of Germany, in the kingdom of Saxony, on the Pleisse, in the industrial district of Zwickau, and 40 m. S. of Leipzig. Pop. (1905) 10,473. Its chief industries are cotton and wool-spinning and the weaving of cloth, but machinery of various kinds, paper and a few other articles are also manufactured. In addition to the usual schools, Werdau contains a weaving-school. The town is mentioned as early as 1364 and in 1388 it was purchased by the margrave of Meissen, who afterwards became elector of Saxony.

See Stichard, Chronik der Fabriksstadt Werdau (2nd ed., Werdau, 1865).

WERDEN, a town of Germany, in the Prussian Rhine province, on the river Ruhr, 6 m. by rail S. of Essen. Pop. (1905) 11,029. It has an interesting Roman Catholic church which belonged to the Benedicite abbey founded about 800 by St Ludger, whose stone coffin is preserved in the crypt. The abbey buildings are used as a prison. The manufacture of cloth, woollens, shoes and paper, dyeing, tanning, brewing and distilling are the principal industries. In the neighbourhood are stone quarries and coal mines. Werden grew up around the Benedicite abbey, which was dissolved in 1802. The Codex Argenteus of Ulfila, now in the university library at Upsala, was discovered here in the 16th century.

See Flügel, Chronik der Stadt Werden (Düsseldorf, 1887); and Führer durch Werden (Werden, 1887).

WERDER, KARL WILHELM FRIEDRICH AUGUST LEOPOLD, COUNT VON (1808–1887), Prussian general, entered the Prussian Garde du Corps in 1825, transferring the following year into the Guard Infantry, with which he served for many years as a subaltern. In 1839 he was appointed an instructor in the Cadet Corps, and later he was employed in the topographical bureau of the Great General Staff. In 1842–1843 he took part in the Russian operations in the Caucasus, and on his return to Germany in 1846, was placed, as a captain, on the staff. In 1848 he married. Regimental and staff duty alternately occupied him until 1865, when he was made major-general, and given the command of a brigade of Guard Infantry. In the Austrian War of 1866 he was greatly distinguished himself at Gitschin (Jěn) and Königgrätz at the head of the 3rd division. He returned home with the rank of lieutenant-general and the order pour le mérite. In 1870, at first employed with the 3rd Army Headquarters and in command of the Württemberg and Baden forces, he was after the battle of Wörth entrusted with the operations against Strassburg, which he captured after a long and famous siege. Promoted general of infantry, and assigned to command the new XIVth Army Corps, he defeated the French at Dijon and at Nuits, and, when Bourbaki's army moved forward to the east, Werder again fought with great success at the action of Villersel, which enabled him to cover the Germans besieging Belfort. On the 15th, 16th and 17th of January 1871, von Werder with greatly inferior forces succeeded in holding his own on the Lissaine against all Bourbaki's efforts to reach Belfort, a victory which aroused great enthusiasm in southern Germany. After the war von Werder commanded the Baden forces, now called the XIVth Army Corps, until he retired in 1879. On his retirement he was raised to the dignity of count. He died in 1887 at Grüssow in Pomerania. The 30th (4th Rhineland) Infantry regiment bears his name, and there is a statue of von Werder at Werder in the Rhineland.

WERGELAND, HENRIK ARNOLD (1808–1845), Norwegian poet and prose writer, was born at Christiansand on the 17th of June 1808. He was the eldest son of Professor Nikolai Wergeland (1780–1848), who had been a member of the constitutional assembly which proclaimed the independence of Norway in 1814 at Eidsvold. Nikolai was himself pastor of Eidsvold, and the poet was thus brought up in the very holy of holies of Norwegian patriotism. He entered the university of Christiansia in 1825 to study for the church, and was soon the leader of a band of enthusiastic young men who desired to revive in Norway the spirit and independence of the old vikings. His earliest efforts in literature were wild and formalless. He was full of imagination, but without taste or knowledge. He published poetical fortes under the pseudonym of "Sifil Sifaffa"; these were followed in 1828 by an unsuccessful tragedy; and in 1829 by a volume of lyrical and patriotic poems, Dige, fjerste Ring, which attracted the liveliest attention to his name. At the age of twenty-one he became a power in literature, and his enthusiastic preaching of the doctrines of the revolution of July made him a force in politics also. Meanwhile he was tireless in his efforts to advance the national cause. He established popular libraries, and tried to alleviate the widespread poverty of the Norwegian peasantry. He preached the simple life, denounced foreign luxuries, and set an example by wearing Norwegian homespun. But his numerous and various writings were coldly received by the critics, and a monster epic, Skabeuen, Mennesket og Messias (Creation, Man and Messiah), 1830, showed no improvement in style. It was remodelled in 1845 as Mennesket. From 1831 to 1835 Wergeland was submitted to severe satirical attacks from J. S. le Welhaven and others, and his style improved in every respect. His nationalistic political propaganda lacked knowledge and system. His partisans were alienated by his inconsistent admiration for King Carl Johan, by his unpopular advocacy of the Jewish cause, and by the extravagance of his methods generally. His popularity waned as his poetry improved, and in 1840 he found himself a really great lyric poet, but an exile from political influence. In that year he became keeper of the royal archives. He died on the 12th of July 1845. In 1898 a statue was erected to his memory by his compatriots at Fargo, North Dakota. His works are: Husums Blomsterstykke (1840), Vedlen (1841), Jidens (1842), Jodinden (1844) and Den Engelske Lods (1844), form a series of narrative poems in short lyrical metres which remain the most interesting and important of their kind in Norwegian literature. He was less successful in other branches of letters; in the drama, neither his Campbellner (1837), Venetianerne (1843), nor Skadetornerne (1848), achieved any lasting success; while his elaborate contribution to political history, Norges Konsulents Historie (1841–1843), is forgotten. The poems of his later years include many lyrics of great beauty, which are among the permanent treasures of Norwegian poetry.

Wergeland's Samlede Skrifter (9 vols., Christiania, 1852–1857) were edited by H. Lassen, the author of Henrik Wergeland og hans Evne (1866), and also by C. H. Schwanenflügel, Henrik Wergeland (Copenhagen, 1877), and J. G. Kraft, Norsk Forfatter-Lexikon (Christiania, 1857), for a detailed bibliography.

WERGILD, WERGILD OF BERG, the Anglo-Saxon term for the fine paid by, e.g., a murderer to the relatives of the deceased in proportion to the rank of the latter. The word was part of the Anglo-Saxon common law, and its origin is unknown. It represented the substitution of compensation for personal retaliation, resulting from the rise in authority of the power of the community as such. (See CRIMINAL LAW; HOMICIDE; AND TETUNIC PEOPLES.)
WERMELSKIRCHEN, a town of Germany, in the Prussian Rhine province, situated 4 m. S.W. from Lenneb by rail and at the junction of a line to Renscheid. Pop. (1906) 15,469. It contains an Evangelical and a Roman Catholic church and a Latin school. Wermelskirchen is the centre of many thriving industries, chief among which are the manufacture of silks, cotton and silk ribbon, cotton, and metal goods. Distilled spirits are also produced. 

WERMUND, an ancestor of the Mercian royal family, a son of Whittleg and father of Offa. He appears to have reigned in Angel, and his story is preserved by certain Danish historians, especially Saxo Grammaticus. According to these traditions, his reign was long and happy, though its prosperity was eventually marred by the raids of a warlike king named Athilas, who slew Frowinus, the governor of Schleswig, in battle. Frowinus's death was avenged by his two sons, Kerto and Wigo, but their conduct in fighting together against a single man was thought to form a national disgrace, which was only obliterated by the subsequent single combat of Offa. It has been suggested that Athilas, though called king of the Swedes by Saxo, was really identical with the Eadgils, lord of the Myrtingas, mentioned in Widisith. As Eadgils was a contemporary of Ermanric (Eormenric), who died about 370, his date would agree with the indication given by the genealogies which place Wermund nine generations above Penda. Frowinus and Wigo are doubtless to be identified with the Frawine and Wig who figure among the ancestors of the kings of Wessex.

For the history of the Franks, see WORMS. The aggression against Wermund in his later years, told by the Danish historians and also by the Vitae duorum Offorum, see OFA; also Saxo Grammaticus, Gesta Danorum, edited by A. Holder, pp. 105 ff. (Strassburg, 1886); Vitae duorum Offorum (in Waite's edition of Matthew Paris, London, 1640). See also H. M. Chadwick, Origin of the English Nation (Cambridge, 1907).

WERNER, ANTON ALEXANDER VON (1843- ), German painter, was born at Frankfort-on-the-Oder, on the 9th of May 1843. He first studied painting at the Berlin Academy, pursued his studies at Karlsruhe, and, having won a travelling scholarship upon the exhibition of his early works, he visited Paris in 1867, and afterwards Italy, where he remained for some time. On his return he received several state commissions, and in the outbreak of the Franco-Prussian War in 1870 he was sent with the staff of the third corps d'armée, and stayed in France till the close of the campaign. In 1873 he was appointed professor at the Berlin Academy, of which he afterwards became director. Among his more important works must be named "The Captitation of Sedan," "Proclamation of the German Empire at Versailles," "Moltke before Paris," "Moltke at Versailles," "The Meeting of Bismarck and Napoleon III. ," "Christ and the Tribute Money," "William I. visiting the Tombs," "The Coronation" and "the Napoleon," and some other of the subjects for the Triumphant Arch at Berlin. Von Werner's work is chiefly interesting for the historic value of his pictures of the events of the Franco-German War.

WERNER, ABRAHAM GOTTLOB (1750-1817), father of German geology, was born in Upper Lusatia, Saxony, on the 25th of September 1750. The family to which he belonged had been engaged for several hundred years in mining pursuits. His father was inspector of Count Solm's iron works at Wehrau and Lowenthal where Werner's infancy was cultivated in him a taste for minerals and rocks. The boy showed early promise of distinction. He began to collect specimens of stones, and one of his favourite employments was to pore over the pages of a dictionary of mining. At the age of nine he was sent to school at Bunzlau in Silesia, where he remained until 1764, when he joined his father at Wehrau with the idea of ultimately succeeding him in the post of inspector. When nineteen years of age (1769) he journeyed to Freiberg, where he attracted the notice of the officials, who invited him to attend the mining school of the town, and study mining. This was the turning point in Werner's career. He soon distinguished himself by his industry and by the large amount of practical knowledge of mineralogy which he acquired. In 1771 he repaired to the university of Leipzig and went through the usual curriculum of study, paying attention at first chiefly to the subject of law, but continuing to devote himself with great ardour to mineralogical pursuits. While still a student he wrote his first work on the external characters of minerals under the title "Natur und Vater der Handelsfragen," (1774), which at once gave him a name among the mineralogists of the day. In 1775 he was appointed inspector in the mining school and teacher of mineralogy at Freiberg. To the development of that school and to the cultivation of mineralogy and geognosy he henceforth, for about forty years, devoted the whole of his active and indefatigable industry. From a mere provincial institution the Freiberg academy under his care rose to be one of the great centres of scientific light in Europe, to which students from all parts of the world flocked to listen to his eloquent teaching. He wrote but little, and though he elaborated a complete system of geognosy and mineralogy he never could be induced to publish it. From the notes of his pupils, however, the general purport of his teaching was well known, and it widely influenced the science of his time. He died at Freiberg on the 30th of June 1817.

One of the distinguishing features of Werner's teaching was the care with which he taught lithology and the succession of geological formation; a subject to which he applied the name geognosy. His "Triumph der geognosy" was the result of the brilliant researches of J. G. Lehmann and G. C. Fuchs (1722-1773). He showed that the rocks of the earth are not disposed at random, but follow each other in certain definite order. Unfortunately he had never enlarged his experience by travel, and the sequence of rock materials of which he had recognized in Saxony was believed by him to be of universal application (see his Kurze Klassifikation und Beschreibung der verschiedenen Gebirgsarten, 1787). He taught that the rocks were the precipitates of a primordial ocean, and followed each other in successive deposits of world-wide extent. Volcanoes were regarded by him as abnormal phenomena, probably due to the combustion of subterranean beds of coal. Basalt and similar rocks, which even then were recognized by other observers as of igneous origin, were believed by him to be water-formed accumulations of the same ancient ocean. Hence arose one of the great historical controversies of geology: Werner's geognosy and the metaphysical theory of origin of rocks, and were known as Neptunist; their opponents, who recognized the important part taken in the construction of the earth's crust by subterranean heat, were styled Vulcanists. R. Jameson, the most distinguished of his British pupils, was for many years an ardent teacher of the Wernerian doctrines. Though much of Werner's theoretical work was erroneous, science is indebted to him for so clearly demonstrating the chronological succession of rocks, for the enthusiastic zeal which he infused into his pupils, and for the impulse which he thereby gave to the study of geology.

See S. G. Frisch, Lebensbeschreibung A. G. Werners (Leipzig, 1825); Currie, Biog. de Werner, (Paris, 1776); and Sir A. Geikie, Founders of Geology (1897; 2nd ed., 1906).

WERNER, FRIEDRICH LUDWIG ZACHARIAS (1768-1823), German poet, dramatist and preacher, was born on the 18th of November 1768 at Königsberg in Prussia. From his mother, who died a religious maniac, Werner inherited a weak and unbalanced nature, which his education did nothing to correct. At the university of his native place he studied law; but Rousseau and Rousseau's German disciples were the influences that shaped his view of life. For years he oscillated violently between aspirations towards the state of nature, which betrayed him into a series of rash and unhappy marriages, and a sentimental admiration—in common with so many of the Romantists—for the Roman Catholic Church, which ended in 1811 in his conversion. Werner's talent was early recognized and obtained for him, in spite of his character, a small government post at Warsaw, which he exchanged afterwards for one at Berlin. In the course of his travels, and by correspondence, he got into touch with many of the men most eminent in literature at the time; and succeeded in having his plays put on the stage, where they met with much success. In 1814 he was ordained priest, and, exchanging the pen for the pulpit, became a popular preacher at Vienna, where, during ten years, he served. In 1823, by a curious and eloquent but fanciful sermons were listened to by crowded congregations. He died at Vienna on the 17th of January 1823.

Werner was the only dramatist of the Romantic movement
WERNIGERODE—WERWOLF

who—thanks to the influence of Schiller—was able to subordinate his exuberant imagination to the practical needs of the stage. His first tragedy, Die Söhne des Tals (1803—1804), is in two parts, and it was followed by Das Kreuz an der Ostsee (1805). More important is the Restoration drama Martin Luther, oder die Wehe der Kraft (1807), which, after his conversion to Catholicism, Werner recanted in a poem Weihe der Unkraft (1813). His powerful one-act tragedy, Der viertendazwanzigste Februar (1815, but performed 1816), was the first of the so-called "fate tragedies." Attila (1808), Wanda (1810) and Die Mutter der Makkabder (1820) show a falling-off in Werner's powers.

Werner's Theodor was first collected (without the author's consent) in 6 vols. (1816-1818); Ausgegebene Schriften (15 vols. 1860-1861), with a biography by K. J. Schütz. See also J. E. Hitzig, Lebensabriß F. L. Z. Werners (1825); H. Dünzter, Zwei Bekehrte (1873); J. Minor, Die Schicksalsdramen in ihrem Haupt-vertreten (1883) and the same author's volume, Das Schicksalsdrama (in Kürschner's Deutsche Nationalliteratur, vol. 151, 1884); F. Poppenberg, Zacharias Werner (1893).

WERWOLF, a town of Germany in the province of Prussian Saxony, 13 m. by rail S.W. of Halberstadt, picturesquely situated on the Holzemme, on the north slopes of the Harz Mountains. Pop. (1905) 13,137. It contains several interesting Gothic buildings, including a fine town hall with a timber façade of 1498. Some of the quaint old houses which have escaped the numerous fires that have visited the town are elaborately adorned with wood-carving. The gymnasium, occupying a modern Gothic building, is the successor of an ancient grammar-school, which existed until 1825. Brandy, cigars and dyestuffs are among the manufactures; the palace above the town rises the château of the prince of Stolberg-Wernigerode. A pavilion in the park contains the library of 117,000 volumes, the chief feature in which is the collection of over 3000 Bibles and over 5000 volumes of hymnology. Wernigerode is the chief town of the county (Grafschaft) of Stolberg-Wernigerode, which has an extent of 107 sq. m., and includes the Brocken within its limits.

The counts of Wernigerode, who can be traced back to the early 12th century, were successively vasals of the margraves of Brandenburg (1268), and the archbishops of Magdeburg (1381). On the extinction of the family in 1429 the county fell to the counts of Stolberg, who founded the Stolberg-Wernigerode branch in 1645. The latter surrendered its military and fiscal independence to Prussia in 1714, but retained some of its sovereign rights till 1876. The counts were raised to princely rank in 1890.

See Förstemann, Die Gräflich-Stolbergische Bibliothek in Wernigerode (1866), and G. Sommer, Die Grafschaft Wernigerode (Halle, 1883).

WERTH [WEERT], JOHANN, COUNT von (c. 1595-1652), German general of cavalry in the Thirty Years' War, was born between 1590 and 1600 at Büttgen in the duchy of Jülich. His parents belonged to the numerous class of the lesser nobility, and at an early age he left home to follow the career of a soldier of fortune in the Walloon cavalry of the Spanish service. In 1622, at the taking of Jülich, he won promotion to the rank of lieutenant. He served as a colonel of cavalry in the Bavarian army in 1630. He obtained the command of a regiment, both titular and effective, in 1642, and in 1633 and 1634 laid the foundations of his reputation as a swift and terrible leader of cavalry forays. His services were even more conspicuous in the great pitched battle of Nördlingen (1634), after which the emperor made him a Freiherr of the Empire, and the elector of Bavaria gave him the rank of lieutenant field-marshall. About this time he armed his regiment with the musket as well as the sword. In 1635 and 1636 his forays extended into Lorraine and Luxemburg, after which he projected an expedition into the heart of France. Starting in July 1636, from the country of the lower Meuse, he raided far and wide, and even urged the cardinal infante, who commanded in chief, to "plant the double eagle on the Louvre." Though this was not attempted, Werth's horsemen appeared at St Denis before the uprising of the French national spirit in the shape of an army of fifty thousand men at Compiègne forced the invaders to retire whence they had come. The memory of this raid lasted long, and the name of "Jean de Werth" figures in folk-songs and serves as a byogue to quiet unruly children. In 1637 Werth was once more in the Rhine valley, destroying convoys, retaining besieged towns, and surprising the enemy's camps. In February 1638 he defeated the Weimar troops in an engagement at Rheinfelden, but shortly afterwards was made prisoner by Bernhard of Saxe-Weimar. His hopes of being exchanged for the Swedish marshal Horn were disappointed, for Bernhard had to deliver up his captive to the French. The terrible Jean de Werth was brought to Paris, amidst great rejoicings from the country people. He was lionized by the society of the capital, visited in prison by high ladies, who marvelled at his powers of drinking and his devotion to tobacco. So light was his captivity that he said that nothing bound him but his word of honour. However, he locked forward with anxiety for his release, which was delayed until March 1642 because the imperial government feared to see Horn at the head of the Swedish army and would not allow an exchange.

When at last he reappeared in the field it was as general of cavalry in the imperial and Bavarian and Cologne services. His first campaign against the French marshal Guébriant was uneventful, but his second (1643) in which Count Mercy was his commander-in-chief, ended with the victory of Tüttlingen, a surprise on a large scale, in which Werth naturally played the leading part. In 1644 he was in the lower Rhine country, but he returned to Mercy's headquarters in time to take a brilliant share in the battle of Freiburg. In the following year his resolution and bravery, and also his uncontrollable rashness, played the most conspicuous part in deciding the day at the second battle of Nördlingen. Mercy was killed in this action, and Werth succeeded to the command of the defeated army, but he was soon superseded by Field-marshall Gelten. Johann von Werth was disappointed, but remained sufficiently loyal to his soldierly code of honour, and found an outlet for his anger in renewed military activity. In 1647 differences arose between the elector and the emperor as to the allegiance due from the Bavarian troops, in which, after long hesitation, Werth, fearing that the cause of the Empire and of the Catholic religion would be ruined if the elector resumed control of the troops, attempted to take his men over the Austrian border. But they refused to follow, and escaping with great difficulty from the elector's vengeance Werth found a refuge in Austria. The emperor was grateful for his conduct in this affair, ordered the elector to rescind his ban, and made Werth a count. The last campaign of 1648 (1648-1649), after which he was released, he retired to live on the estates which he had bought in the course of his career, and on one of these, Benakate near Königgrätz, he died on the 16th of January 1652.

See Lives by F. W. Barthold (Berlin, 1826), W. von Janko (Vienna, 1874), F. Teicher (Augsburg, 1877).

WERWOLF (from A.S. wer; cf. Lat. vir, man; and wolf; or, according to a later suggestion, from O.H.G. wer, i.e. wearer of the wolf-skin), a man transformed temporarily or permanently into a wolf. The belief in the possibility of such a change is a special phase of the general doctrine of lycanthropy (q.v.). In the European history of this singular belief, wolf transformations appear as by far the most prominent and most frequently recurring instances of alleged metamorphosis, and consequently in most European languages the terms expressive of the belief have a special reference to the wolf. Examples of this are found in the Gr. ἄλμωστος, Russian volkodlak, Eng. "werewolf," Ger. wölfe, Fr. loup-garou. More general terms (e.g. Lat. veripellis; Russ. obozor; O. Norse, hウンamr; Eng. "turncoat," "transform") are sufficiently numerous to furnish some evidence that the class of animals into which metamorphosis was possible was not viewed as a restricted one. But throughout the greater part of Europe the werewolf is preferred; there are old traditions of his existence in England, in Wales and in Ireland; in southern France, Germany, Lithuania, Bulgaria, Servia, Bohemia, Poland and Russia he can hardly be pronounced extinct now; in Denmark, Sweden,
Norway and Iceland the bear competes with the wolf for pre-eminence.

In Greek mythology the story of Lycaon supplies the most familiar instance of the werewolf. According to one form of it Lycaon was transformed into a wolf as a result of eating human flesh; one of those who were present at periodical sacrifice on Mount Lycaon was said to suffer a similar fate. Pliny, quoting Euanthes, tells us (Hist. Nat. viii. 22) that a man of the family of Antaeus was selected by lot and brought to a lake in Arcadia, where he hung his clothing on an ash and swam across. This resulted in his being transformed into a wolf, and he wandered in this shape nine years. Then, if he had attacked no human being, he was at liberty to swim back and resume his former shape. Probably the two stories are identical, though we hear nothing of participation in the Lycaean sacrifice by the descendant of Antaeus. Herodotus (iv. 105) tells us that the Neuri, a tribe of eastern Europe, were annually transformed for a few days, and Virgil (Eccl. viii. 98) is familiar with transformation of human beings into wolves. There are women, so the Armenian belief runs, who in consequence of deadly sins are condemned to pass seven years in the form of a wolf. A spirit comes to such a woman and brings her a wolf's skin. He orders her to put it on, and no sooner has she done this than the most frightful wolfish cravings make their appearance and soon get the upper hand. Her better nature conquered, she makes a meal of her own children, one by one, then of her relatives' children according to the degree of relationship, and finally the children of strangers begin to fall a prey to her. She wanders forth only at night, and doors and locks cannot hold her in. She is then a wolf, and is a more terrible werewolf when she returns to human form and removes her wolf's skin. In these cases the transformation was involuntary or virtually so. But by side with this belief in involuntary metamorphosis, we find the belief that human beings can change themselves into animals at will and then resume their own form.

The expedients supposed to be adopted for effecting change of shape may here be noticed. One of the simplest apparently was the removal of clothing, and in particular of a girdle of human skin, or the putting on of such a girdle—more commonly the putting on of a girdle of the skin of the animal whose form was to be assumed. This last device is doubtless a substitute for the assumption of an entire animal skin, which also is frequently found. In other cases the body is rubbed with a magic salve. To drink water out of the footprint of the animal in question, to partake of its brains, to drink of certain enchanted streams, were also considered effectual modes of accomplishing metamorphosis. Olaus Magnus says that the Livonian werewolves were initiated by draining a cup of beer specially prepared, and repeating a set formula. Ralston in his Songs of the Russian People gives the form of incantation still familiar in Russia. Various expedients also existed for removing the beast-shape. The simplest was the act of the enchanter (operating either on himself or on a victim); another was the removal of the animal girdle. To kneel in one spot for a hundred years, to be reproached with being a werewolf, to be saluted with the sign of the cross, or addressed thrice by baptismal name, to be struck three blows on the forehead with a knife, or to have at least three drops of blood drawn were also effectual cures. In other cases the transformation was supposed to be accomplished by Satanic agency voluntarily submitted to, and that for the most loathsome ends, in particular for the gratification of a craving for human flesh. "The werewolves," writes Richard Verstegan (Restitution of Decayed Intelligence, 1628), "are certayne sorcerers, who having annoyted their bodies with an oyentment which they make by the instinct of the devil, and putting on a certayne enchanted girdle, doe not onely unto the view of others seeme as wolves, but to their owne thinking have both the shape and nature of wolves, so long as they wear the said girdle. And they doe dispose themselves as very wolves, in wourrying and killing, and most of humane creatures." Such were the views about lycanthropy current throughout the continent of Europe when Verstegan wrote. France in particular seems to have been infested with werewolves during the 16th century, and the consequent trials were very numerous. In some of the cases—e.g. those of the Gandillon family in the Jura, the tailor of Châlons and Roulet in Angers, all occurring in the year 1598,—there was clear evidence against the accused of murder and cannibalism, but none of association with wolves; in other cases, as that of Gilles Garnier in Dôle in 1573, there was clear evidence against some wolf, but none against the accused; in most cases, with one approach. When moral evidence was drawn there was no other readiness in the accused to confess and even to give circumstantial details of the metamorphosis, which is one of the most inexplicable concomitants of medieval witchcraft. Yet, while this lycanthropy fever, both of suspects and of suspected, was at its height, it was decided in the case of Jean Grenier at Bordeaux, in 1603, that lycanthropy was nothing more than an insane delusion. From this time the *loup-garou* gradually ceased to be regarded as a dangerous heretic, and fell back into his pre-Christian position of being simply a "man-wolf-fiend," who entertained heretical opinions. In Prussia, Livonia and Lithuania, according to the bishops Claus Magnus and Majolus, the werewolves were in the 16th century far more destructive than "true and natural wolves," and their heterodoxy appears from the assertion that they formed "an accused college" of those "desirous of innovations contrary to the divine law." In England, however, where at the beginning of the 17th century the punishment of witchcraft was still zealously prosecuted by James I., the wolf had been so long extinct that that pious monarch was himself able (Demonologie, lib. III.) to regard "warwooles" as victims of delusion induced by a "natural superabundance of melancholie." Only a few cases, such as the cat, the hare and the weasel, remained for the malignant sorcerer to transform himself into; but he was firmly believed to avail himself of these agencies. Belief in witch-animals still survives among the uneducated classes in parts of the United Kingdom.

The werewolves of the Christian dispensation were not, however, all heretics, all viciously disposed towards mankind. "According to Baronius, in the year 617, a number of wolves presented themselves at a monastery, and tore in pieces several friars who have been mentioned, as with the others mentioned, as giving special attention to this subject: Wier, De praestoipis daemonum (Amsterdam, 1653); Bodin, Demonomanie des sorciers (Paris, 1550); Bouquet, Discours des sorciers (Lyons, 2nd ed. 1668);

(N. W. T.; J. F. M.L.)

WESEL JOHANN RUCHRAT VON (d. 1481), German theologian, was born at Oberwesel early in the 15th century. He appears to have been one of the leaders of the humanist movement in Germany, and to have had some intercourse and sympathy with the leaders of the Hussites in Bohemia. Erzur was in his day the headquarters of a humanism which was both devout and opposed to the rationalist and Thomist theology which prevailed in the universities of Cologne and Heidelberg. Wesel was one of the professors at Erfurt between 1445 and 1456, and was vice-rector in 1458. In 1460 he was appointed preacher at Mainz, in 1462 at Worms, and in 1479, when an old and worn-out man, he was brought before the Dominican inquisitor Gerhard Elten of Cologne. The charges brought against him took a theological turn, though they were probably prompted by dislike of his philosophical views. They were chiefly based on a treatise, De indultentia, which he had composed before the first two parts of the treatise, De potestate ecclesiastica. He died under sentence of imprisonment for life in the Augustinian convenl in Mainz in 1481.

It is somewhat difficult to determine the exact theological position of Wesel. Ullmann claims him as a "reformer before the Reformation," but, while he mastered the formal principle of Protestantism, that scripture is the sole rule of faith, it is more than doubtful that he had that experimental view of the doctrines of grace which lay at the basis of Reformation theology. He held that Christ is man's righteousness in so far as they are guided by the Holy Ghost, and the love towards God is shed abroad in their hearts, while clearly shows that he held the medieval idea that justification is an habitual grace implanted in men by the gracious act of God. He seems, however, to have protested against certain medieval ecclesiastical ideas which he held to be excrescences erroneously grafted on Christian faith and practice. He objected to the whole system of indulgences; he denied the infallibility of the church, on the ground that the church contains within it sinners as well as saints; he insisted that papal authority could be upheld only when the pope remained true to the evangel; and he held that a sharp division ought not to be drawn between ecclesiastical sentences and punishments, and the judgments of God.

The best account of Wesel is to be found in K. Ullmann's Reformers before the Reformation. His tract on Indulgences is published in Walch's Monumenta Medii Aevi, vol. 1, while a report of his trial is given in Ortin Gratius's Passiacis rerum exstipendiarum et fama famam (ed. by Brown, London, 1663); and d'Argent's Collectio juridicorum de novis erroribus (Paris, 1728). See also Otto Clemen's article in Herzog-Hauck's Realencyclopdäie fur Theol. und Kirche (3rd ed., Leipzig, 1908), xxii, 127.

WESEL, a fortress town of Germany, in the Prussian province of Westphalia at the confluence of the Rhine and the Lippe, 46 m. S. of Münster and 35 m. N.W. of Duisburg. Pop.(1905) 23,337 (45% Protestants), including a considerable garrison. There is a junction of five railway lines, and the Rhine is crossed by a large railway bridge and by a bridge of boats. The inner line of fortifications was razed in 1806, and the defensive works now consist only of the citadel and three detached forts, one of which, Fort Blücher, serves as a tête-de-pont on the left bank of the Rhine. Wesel contains some quaint old houses, and a town hall, dating from 1396, with an elaborate façade, and containing a valuable collection of old silver plate. The large Protestant church of St. Willibrord has a choir, built 1422-1526, which is one of the noblest Gothic structures on the Lower Rhine, and a modern nave (1892-96). The Mathena church dates from 1429-1477. The two Roman Catholic churches, the castle, now the commandant's house (built in 1417), the Berliner Tor—Berlin gate—built in 1722 and recently restored, the Lower-Rhenish museum of antiquities and the modern gymnasium and military hospital, are among the other chief buildings. Wesel carries on a considerable trade in grain, timber, colonial goods, tobacco, &c., facilitated by new harbour accommodation and wharves at the mouth of the Lippe. It has manufactures of wire, leaden pipes and other metal goods, cement, sugar, &c.

Wesel, formerly known as Lippermünde, was one of the points which Charlemagne directed his operations against the heathen Saxons. In 1366 it was invested by the Hanseatic league, and it became a flourishing commercial town, and though repeatedly subject to the counts of Cleves, was a member of the Hanseatic league, and as late as 1521 a free imperial city. It was occupied by the Spaniards in 1614, by the Dutch in 1629, by the French in 1672, also during the Seven Years' War, and in 1805, and was ceded to Prussia in 1814. A monument outside the town commemorates the deaths of Ferdinand von Schill's officers who were shot here on the 16th of September 1809 after their unsuccessful attempt at strabasburg. Wesel is occasionally spoken of as Unterwesel, to distinguish it from Oberwesel, a small town on the Rhine, above St. Goar.

See Gantesweiler, Chronik der Stadt Wesel (Wesel, 1883), and Reinhold, Verfassungsgeschichte Wesels (Breslau, 1888).

WESER (O. Ger. Visurach, Wisura, Lat. Visurgis), one of the chief rivers of Germany, formed by the union of the Weser and the Fulda, which branches into the right Prussian, and the left Hanseatic, Weser. Wesel, after flowing generally north and entering the North Sea below Bremerhaven, between Jade Bay and the estuary of the Elbe. The mouth is 170 m. from Münden, but the winding course of the river is 270 m. long; if the measurement be made from the source of the Werra, in the Thüringer Wald, the total length of the stream is 440 m. At Münden the river surface is 380 ft. above sea-level; the most rapid fall in its course is between Karlshafen and Münden in Westphalia. Nearly the entire course of the Weser lies in Prussia, but it also touches part of Brunswick and Lippe, and after flowing through Bremen expands into an estuary separating the duchy of Oldenburg from the Prussian province of Hanover. Between Münden and Stade its course lies through a picturesque valley flanked by irregular and disjointed ranges of hills (Reinhardswald, Sollingwald, Weser Hills, &c.); but after it emerges from these mountains by the narrow pass called the "Porta Westfalica," near Minden, its banks become flat and uninteresting. The breadth of the river varies from 110 yds. at Münden to 220 yds. at Minden, 230 yds. at Bremen, 14 m. at Ellisleth and 74 m. at its entrance into the sea.

The Weser on the whole is shallow, and navigation above Bremen is sometimes interrupted by drought. Until 1804 the fairway up to Bremen had a minimum depth of little over 8 ft.; thereafter important works were undertaken, the minimum depth was made 18 ft., and the importance of Bremen as a port was greatly enhanced. Boats of 350 tons can ascend generally as far as Münden. A system of waterways (the Geeste and Hadelner canals, meeting one another at Bedekess) connects the estuary of the Weser with that of the Elbe. A canal between the Hunte and the Leda gives connection with the Ems. On the upper Weser (above Bremen) the navigation, which is interrupted by occasional rapids, is assisted by locks and weirs. The principal navigable points on the right are the Ahrensee, Droptee, Lune and Geeste, and on the left the Diemel, Nethe, Emmer, Werra, Aue and Hunte. The Werra and Fulda are both navigable when they unite to form the Weser, the Fulda being canalsized between Casel and the town of Fulda for a distance of 172 m.; the Aller, Wümme, Geeste and Hunte are also navigable. Below the junction of the Hunte the Weser, hitherto a single stream, is divided into two large channels and several islands. The Weser drains a basin estimated at 18,630 sq. m.

The navigation of the Weser was long hampered by the various vexatious claims and rights of the different states through which its course passes, but the Great Powers in 1858 included the Werra and the Fulda, changed its ruler no less than thirty-five times on its way to the sea. In 1823, however, a treaty was established, fixing the line of demarcation between the main stream of the Weser and the Fulda, and the Weser further improved in 1856 and 1865; and when Prussia took possession of Hanover and Hesse-Nassau in 1866 the chief difficulties in the way of organizing the river-trade disappeared. The principal town on the Weser is Bremen. Other towns past which it flows
between Münden and the sea are Karlsfahen, Höxter, Holzminen, Bodenwerder, Hameln, Rinteln, Vlotho, Münden, Stolzenau, Nienburg, Vogezeack, Elisabeth, Brake, Geestemünde and Bremen. Wesley gave up his name to a department in the short-lived kingdom of Westphalia; the chief town was Osnabrück.

**WESLEY (FAMILY).** The Wesley family sprang from Wales, near Wells in Somerset. Their pedigree has been traced back to Guy, whom Athelstan made a thane about 938. One branch of the family settled in Ireland. Sir Herbert Wesley of Westleigh, Devon, married Elizabeth, daughter of William, who died in Ireland. Their third son, Bartholomew, studied both medicine and theology at Oxford, and, in 1699, married the daughter of Sir Henry Colley of Kildare. In 1660 he held the rectories of Catherston and Charmouth in Dorset valued at £35. 10s. per annum. He was ejected in 1662 and gained his living as a doctor. He was buried at Lyne Regis on February 17th, 1670.

His son, John Wesley, grandfather of the founder of Methodism, was born in 1676 and studied at New Inn Hall, Oxford, where he became proficient in Oriental languages and won the special regard of John Owen, then vice-chancellor of the university. Cromwell's trials annoyed him. He was appointed clergyman to the parish of Elsfleth, in Westphalia, in 1636, where he served as visiting chaplain to the family of Sir John Winterborn of Bremerhayen, near Hameln. Here he gained the name of the youngest of the four sons of his grandfather's curate. Within a year he was made a deacon of the English church in the town of Westphalia, and the town council gave him a pension.
Oxford, with an annual allowance of £40 as a Charterhouse scholar. His health was poor and he found it hard to keep out of debt, but he made good use of his opportunities. A scheme of study which he drew up for 1722 with a time-table for each day of the week is still to be seen in his earliest diary, which became the property of Mr George Stamped of Great Grimsby. The diary runs from April 5, 1725, to February 19, 1727. A friend describes Wesley at this time as "a young fellow of the finest classical taste, and the most liberal and manly sentiments." He was "gay and sprightly, with a turn for wit and humour."

The standard edition of Wesley's Journal (1909) has furnished much new material for this period of Wesley's life, the Rev. N. Curnock having unravelled the difficult cipher and shorthand in which Wesley's early diaries were kept. He reached the conclusion that the religious friend who directed Wesley's attention to the writings of Thomas à Kempis and Jeremy Taylor, in 1725, was Miss Betty Kirkham, whose father was rector of Stanton in Gloucestershire. Up to this time Wesley says he had no notion of inward holiness, but went on "habitually," in 1725, to attend the evening service at the church in Lincoln, and on the 17th of March 1726 was elected fellow of Lincoln. His private diaries, seven of which are in the hands of Mr Russell J. Colman of Norwich, contain monthly reviews of Wesley's reading. It covered a wide range, and he made careful notes and abstracts of it. He generally took breakfast or tea with some congenial friend and occasionally to discuss the deepest subjects. At the coffee house he saw the Spectator and other periodicals. He loved riding and walking, was an expert swimmer and enjoyed a game of tennis.

He preached frequently in the churches near Oxford in the months succeeding his ordination, and in April 1726 he obtained leave from his college to act as his father's curate. The new material in the Journal describes the simple matter of his life. He read plays, attended the village fairs, shot plovers in the fenland, and enjoyed a dance with his sisters. In October he returned to Oxford, where he was appointed Greek lecturer and moderator of the classes. He gained considerable reputation in the disputations for his master's degree in February 1727. He was now free to follow his own course of studies and began to lose his love for company, unless it were with those who were drawn like himself to religion. In August he returned to Lincolnshire, where he assisted his father till November 1729. During those two years he paid three visits to the university. In the summer of 1729 he was up for two months. Almost every evening found him with the little society which had gathered round Charles.

When he came into residence in November he was recognized as the father of the Holy Club. It met at first on Sunday evenings, then every evening was passed in Wesley's room or that of some other member. They read the Greek Testament and the classics; fasted on Wednesday and Friday; received the Lord's Supper every week; and brought all their life under review. In 1730 William Morgan, an Irish student, visited the gaol and reported that there was "no beholding any lawyer's work upon him in prison," he agreed to visit the Castle twice a week and to look after the sick in any parish where the clergyman was willing to accept their help. Wesley's spirit at this time is seen from his sermon on "The Circumcision of the Heart," preached before the university on the 1st of January 1733. In 1736 he said it "contains all that I now teach concerning salvation from all sin, and loving God with an undivided heart," and four years later this theology was "the key that opened the remainder of his income. He already displayed those gifts for leadership which were to find so conspicuous a field in the evangelical revival. John Gomblot, a member of the Holy Club, who afterward assumed the calling of a bishop, "has been the wife and nurse of every activity as to be always gaining ground, and so steadfastly that he lost none. What proposals he made to any were sure to charm them, because they saw him always the same." He wore an air of authority yet never lacked address or "assuming anything to himself above his contemporaries." William Law's books produced a great impression on Wesley, and on his advice the young tutor began to read mystic authors, but he saw that their tendency was to make good works appear mean and insipid, and he soon laid them aside.

Wesley had not yet found the key to the heart and conscience of his hearers. He says, "From the year 1729 I did not preach much, but saw no fruit to my labour. Indeed it could not be that I should; for I neither laid the foundation of repentance nor of preaching the Gospel, taking it for granted that all to whom I preached were educated in the religious and moral teaching of the Church. From the year 1729 to 1734, laying a deeper foundation of repentance, I saw a little fruit. But it was only a little; and no fruit of fruitfulness. If I did not preach from the pulpit, from 1734 to 1738, speaking more of faith in Christ, I saw more fruit of my preaching." Looking back on these days in 1777, Wesley felt "the Methodists at Oxford were all one body, and, as it were, one man, zealous for the religion of the Bible, of the Primitive Church, and, in consequence, of the Church of England; as they believed it to come nearer the scriptural and primitive plan than any other national church on earth." Almost every Methodist was small and probably never exceeding twenty-five. John Clayton, afterwards chaplain of the Collegiate Church of Manchester, who remained a strong High Churchman; James Hervey, author of Meditations among the Tombs, and Ithamar and Aspicia; Benjamin Ingham, who became the Yorkshire evangelist; and Thomas Broughton, afterwards secretary of the S.P.C.K., were members of the Holy Club, and George Whitefield joined it on the eve of the Wesley's arrival at Oxford.

Wesley's father died on April 25, 1735, and in the following October John and Charles took ship for Georgia, with Benjamin Ingham and Charles Delamotte. John was sent out by the Society for the Propagation of the Gospel, and hoped to labour as a missionary among the Indians, but though he had many interesting conversations with them the mission was found to be impracticable. The cabin of the "Simmonds" became a study for the four Methodists. The calm confidence of their Moravian fellow-passengers amid the Atlantic storms contrasted with Wesley's restlessness. Wesley does not possess the faith which counts out fear. Closer acquaintance with these German friends in Savannah deepened the impression. Wesley needed help, for he was beset by difficulties. Mrs Hawkins and Mrs Welch poisoned the mind of Colonel Ogilthorpe against the brothers for a time. Wesley's attachment to Miss Hopkey also led to much pain and disappointment. All this is now seen more clearly in the standard edition of the Journal. Wesley was a stiff High Churchman, who scrupulously followed every detail of the rubrics. He insisted on baptizing children by trine immersion, and refused the Communion to a pious German because he had not been baptized by a minister who had been episcopally ordained. At the same time he was accused of "introducing into the church and service at the altar compositions of psalms and hymns not inspected or authorized by any proper judicature." The list of grievances presented by Wesley's enemies to the Grand Jury at Savannah gives abundant evidence of his unwearing labours for his flock. The foundation of his future work as the father of Methodist hymnody was laid in Georgia. His first Collection of Psalms and Hymns (Charlestown, 1737) contains five of his incomparable translations from the German, and on his return to England he published another Collection in 1738, with five more translations from the German and one from the Spanish. In April 1736 Wesley formed a little society of thirty or forty of the serious members of his congregation. He calls this the second rise of Methodism, the first being at Oxford in November 1729. The company in Savannah met every Wednesday evening "in order to a free conversation, begun and ended with singing and prayer." A select company of these met at the parsonage on Sunday afternoons. In 1781 he writes, "I cannot but observe that there were never first rudiments of the Methodist societies."

In the presence of such facts we can understand the significance of the mission to Georgia. Wesley put down many severe things against himself on the return voyage, and he saw afterwards that even then he had the faith of a servant though not that of a son. In London he met Peter Böhler who had been ordained by Zinzendorf for work in Carolina. By Böhler Wesley was convinced that he lacked "that faith whereby alone we are saved." On Wednesday, May 24, 1738, he went to a society meeting in Aldersgate Street where Luther's Preface to the Epistle to the Romans was being read. "About a quarter
before nine, while he was describing the change which God works in the heart through faith in Christ, I felt my heart strangely warmed. I felt I did trust in Christ, Christ alone, for salvation; and an assurance was given me that he had taken away my sins, even mine, and saved me from the law of sin and death." Mr Lecky points out the significance of that event. "It is scarcely an exaggeration to say that the scene which took place at that humble meeting in Aldersgate Street forms an epoch in English history. The conviction which then flashed upon one of the most powerful and most active intellects in England is the true source of English Methodism." (History of England in Eighteenth Century, ii. 559.)

In January, 1739, during the summer of 1738 in visiting the Moravian settlement at Herrnhuth and returned to London on September 16, 1738, with his faith greatly strengthened. He preached in all the churches that were open to him, spoke in many religious societies, visited Newgate and the Oxford prisons. On New Year's Day, 1739, the Wesleys, Whitefield and other friends had a Love Feast at Fetter Lane. In February Whitefield went to Bristol, where his popularity was unbounded. When the churches were closed against him he spoke to the Kingswood colliers in the open air, and after six months, when the Wesleyan could not take up the work. Wesley was in his friend's congregation on April 1, but says, "I could scarcely reconcile myself to this strange way of preaching in the fields... having been all my life (till very lately) so tenacious of every point relating to decency and order, that I should have thought the saving of souls almost a sin, if it had not been done in a church." Next day Wesley followed Whitefield's example. His fears and prejudices melted away as he discerned that this was the very method needed for reaching the multitudes living in almost heathen darkness. He already had the means of shepherding those who were impressed by the preaching. On the 21st of May 1738 he wrote in his journal: "This evening our little society began, which afterwards met in Fetter Lane." Among its "fundamental rules" we find a provision for dividing the society into bands of five or ten persons who spoke freely and plainly to each other as to the "real state" of their hearts. The bands united in a conference every Wednesday evening. The society first met at James Hutton's shop, "The Bible and Sun," Wild Street, west of Temple Bar. About the 25th of September it moved to Fetter Lane. Wesley describes this as the beginning of his "Methodism." After the field preaching began converts multiplied. They found all the world against them, and Wesley advised them to strengthen one another and talk together as often as they could. When he tried to visit them at their homes he found the task beyond him, and therefore invited them to meet him on Thursday evenings. This meeting was held in the end of 1739 at the Foundery in Moorfields which Wesley had just secured as a preaching place. Grave disorders had arisen in the society at Fetter Lane, and on the 25th of July 1740 Wesley withdrew from it. About 25 men and 42 women also left and cast in their lot with the society at the Foundery. The centenary of Methodism was kept in 1839, a hundred years after the society first met at the Foundery.

Wesley's headquarters at Bristol were in the Horse Fair, where a room was built in May 1739 for two religious societies which had been accustomed to meet in Nicholas Street and Baldwin Street. To meet the cost of this Captain Fox suggested that each member should give a penny per week. When it was urged that some were too poor to do this, he replied, "Then pay the cost of the room, or you are not in the cause." This was in gory of a movement they can n't do anything for. I will call on them weekly, and if they can give nothing I will give for them as well for myself." Others followed his example and were called leaders, a name given as early as the 5th of November 1738 to those who had charge of the bands in London. Wesley saw that here was the very means he needed to watch over his flock. The leaders thus became a body of lay pastors. Those under their care formed a class. It proved more convenient to meet together and this gave opportunity for religious conversation and prayer. As the society increased Wesley found it needed "still greater care to separate the precious from the vile." He therefore arranged to meet the classes himself every quarter and gave a ticket "under his own hand" to every one "whose seriousness and good conversation" he found no reason to doubt. The ticket furnished an easy means for guarding the meetings of the society against intrusion. "Bands" were formed for those who wished for closer communion. Love-feasts for fellowship and testimony were also introduced, according to the custom of the primitive church. Watchnight services were due to the suggestion of a Kingswood collier in 1740. Wesley issued the rules of the united societies in 1743. "Those who wished to enter the society must have "a desire to flee from the wrath to come, to be saved from their sins." When admitted they were to give evidence of their desire for salvation; "by doing no harm; by doing good of every possible sort; by attending upon all the means of grace." It was expected that all who could do so would contribute the penny a week suggested in Bristol, and give a shilling at the renewal of their quarterly ticket. Wesley had at first to take charge of the contributions, but as they grew larger he appointed stewards to receive the money, to pay debts, and to relieve the poor. Wesley himself stipulated that no person who had been a week before Wesley's field of labour was extended to the north of England in May 1742. He found Newcastle ripe for his message. English Christianity seemed to have no power to uplift the people. Dram-drinking was spreading like an epidemic. Freethinkers' clubs flourished. "The old religion," Lecky says, "seemed everywhere loosening round the minds of men, and indeed it had often no great influence even on its defenders." Some of the clergy in country parishes were devoted workers, but special zeal was not encouraged or discouraged.
